Brazil Commercially Considered. London: The Syren and Shipping, Ltd. 5s. net.—In the 100 pages of fully illustrated matter contained in this publication the publishers have set forth the first results of a tour of Brazil, Argentina and Chile, which was made on their behalf by a Special Commissioner, Mr. D. Paterson Maitland, with the object of helping British trade in South America after the war. The articles are very numerous, and cover many aspects of Brazilian affairs. The history of Brazil, its geography and economic progress, its foreign trade, its waterfalls and their industrial potentialities, its different industries (rubber, cotton, sugar, mining, meat, &c.), and many other such matters are reviewed and described; finely illustrated descriptions appear of the undertaking of the Brazilian Traction, Light and Power Co., Ltd., and the Rio de Janeiro and Sao Paulo systems, also of the system of the Companhia Telefonica do Estado de Sao Paulo. Some pages are devoted to an account of shipping services, especially that of the R.M.S.P. Co. Altogether, the work contains a great deal of information which should be of use to firms who are interested in export trade to Brazil.

"Journal of the Institution of Electrical Engineers" and Index. Vol. LV, No. 268, July, 1917.—This issue contains the following papers:—"Magnetomotive Force of Armature Windings," by Mr. B. Hague; "Magnetic Shielding of Large Spaces," by Prof. E. Wilson; "Pressure Drop Curves for Copper Overhead Lines," by Mr. G. N. Wright; also the twelfth list of 63 members on military service.

"Registration and Publication of Directors' Names, under the Companies (Particulars as to Directors) Act, 1917." By Herbert W. Jordan. London: Jordan & Sons, Ltd. 6d. net.

"Miniature Electric Light." By B. E. Jones. London: Cassell and Co., Ltd. Price 1s. 3d. net.

"La Formation des Ingenieurs en France et a l'Etranger." Paris: Librairie, Armand Colin. Price 2 fr.

"Proceedings of the Physical Society." Vol. XXIX, Part 5, August 15th, 1917. London: The Fleetway Press, Ltd. Price 4s. net.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXVI, No. 8, August, 1917. New York: The Institute. \$1. Report No. 19 of the Second Section of the Electro-Technical Laboratory, Tokio, on "Telephonic Transmission Losses of Bridged Impedances, Series Resistances and Capacitances."

Trade Inquiries.—According to the *Board of Trade Journal*, a Brisbane firm of electrical engineers and merchants desires to get into touch with firms in this country supplying electric motors and generators, accessories, wires and cables, fittings, batteries, lamps, &c., with a view to representing them in Queensland.

The Acting British Consul at Turin reports that a firm of manufacturers' agents in that city desires to obtain agencies for United Kingdom manufacturers of machinery and electrical apparatus, who may obtain the name and address of the firm referred to on application to the Department of Commercial Intelligence, 73, Basinghall Street, London, E.C. 2. (Inquiry No. 315.)

Electrical Trade in South Africa.—The *S.A. Mining Journal* for July 7th states that the shortage of household filament lamps is getting into the acute stage, as the wholesale houses are said to be out of the 50-c.p. globes, therefore many of the shops either have to use 32 or 100 c.p. "The price has advanced from 6s. to 9s. per dozen for all lamps. There is a demand for small electric meters, as property owners are being compelled to protect themselves against the unfair consumption for radiators, electric kettles, irons, &c. In one instance, a block of rooms in the less fashionable part of the town, under a Kaffir caretaker, used over £20 worth of current last month, as compared with an average of £6. This extra could only be accounted for by the use of radiators and other warming apparatus, as a set-off against the cold weather experienced of late. The Municipal Supply Branch has given notice that owing to there being no suitable cable, due to circumstances arising out of the war, the Town Council is unable to entertain new applications for electric supply in Johannesburg and 26 suburban townships."

Catalogues and Lists.—BRITISH THOMSON-HOUSTON CO., LTD., 77, Upper Thames Street, London, E.C.—New 20-page list of illuminated glassware. It is printed very attractively in three colours, a life-like effect being given to the various illustrations of glassware by the use of coloured background panels. The types of glassware listed and illustrated are the well-known types of glass associated with the name of the company—Veluria, Alabas, and Calla. The list also illustrates new forms of Veluria dishes and bowls, and a new type of glass known as "Druid," which is similar to Alabas, but less expensive. Two pages are devoted to listing and illustrating pure alabaster bowls. Copies of the list have already been distributed to holders of the B.T.H. Lamp and Wiring Supplies Handbook Binder.

MESSRS. JOHNSON & PHILLIPS, LTD., Charlton, London, S.E. 7.—Three new illustrated leaflets:—No. 5 (8 pages) shows the company's standard range of underground non-disconnecting boxes (straight

through, three-way, four-way) for all types of cables, also armouring clamps and wiping glands; No. 1 (2 pages) tabulates particulars of J. and P. switch fuses (tubular pattern); and No. 2 (2 pages) deals similarly with isolating switches.

Trade Announcements.—MESSRS. BROOKS' ELECTRICAL SUPPLIES CO. have commenced business as dealers in electrical supplies at 3, Goddliman Street, London, E.C. 4. Mr. Alex. D. Brockhuijsen (Dutch) is the sole proprietor.

THE ENTERPRISE MANUFACTURING CO., LTD., state that they have terminated their arrangements with Messrs. Andrews & Co., and have appointed as their sole agents for Scotland Messrs. Paterson & Service, 38, Bath Street, Glasgow.

Liquidations.—RURAL DISTRICTS ELECTRIC UNDERTAKINGS, LTD.—Creditors must send particulars of debts, &c., to the liquidator, Mr. G. W. Brown, 21, Martin's Lane, E.C. 4, by August 31st.

LEITNER ELECTRICAL CO. LTD., Maybury. A second dividend of 1s. in the £ is payable on September 10th at the offices of Messrs. Corfield & Cripwell, 119, Finsbury Pavement, E.C.

LIGHTING AND POWER NOTES.

Argentina.—The Buenos Aires Provincial town of Patagonas has been without public lighting for some time past, the service having been suspended by the company owing to non-payment of the debt due to it by the community.

The inhabitants of the town of Pergamino (Province of Buenos Aires) were notified recently by the local management of the electric light company (Compania de Electricidad de la Provincia de Buenos Aires) that the service would be suspended in view of the difficulty the company had in collecting the municipal lighting debt, which amounts to over \$107,000 m/n.

At the last moment an arrangement was come to for the continuance of the service, the Municipal authorities giving to the electric company the blank receipts for public lighting collectible from householders, and renewing their "pagaré" for \$41,149.94 m/n., which fell due on May 1st last.

It is reported from San Justo and from San Antonio de Arco (both in the Province of Buenos Aires) that the local electric light companies have the intention of suspending the public service owing to non-payment of accounts by the communal authorities.—*Review of the River Plate.*

Burnley.—The electrical engineer has reported to his Committee that, owing to the shortage of refuse for fuel, the coal consumption has been seriously increased. He has prepared a statement showing the failure of supplies, and this is to be submitted to the Cleansing Committee.

Crayford.—STREET LIGHTING.—The West Kent Electric Co. has informed the P.C. that it cannot supply current for public lighting on London Road until the further mains are laid towards the parish.

London.—HAMMERSMITH.—PRICE INCREASE.—The Electricity Committee has had under consideration the financial position of the electricity undertaking, more particularly the revenue now received in respect of supply to consumers. The Committee points out that the present charges for supply were fixed in 1905. The increase in the output during the past few years alone has enabled the Council to delay making any advance in the prices, but owing to the greatly increased generating costs (coal alone being 11s. per ton in excess of the price paid in 1913-14), and the high prices of materials, new plant, &c., the Committee recommends that, as from September 29th next, the charges for lighting and power, including special supplies, be increased by 12½ per cent.

Rawmarsh.—A Sub-Committee of the U.D.C. is to meet the Rotherham Electricity Committee on the question of supplying power in the Rawmarsh district.

Southend-on-Sea.—A motor-generator for charging at the refuse destructor the batteries of electrical-driven tip wagons for dust collection is to be purchased, with other plant, at a cost of about £500.

Stalybridge.—The Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board has resolved that motor rentals be increased by 20 per cent. from January 1st, 1918, and that notice of the increase be given to consumers.

Straits Settlements.—GEORGE TOWN (PENANG) ELECTRICITY DEPARTMENT.—The report of Mr. O. V. Thomas, engineer and manager of the municipal electrical undertaking, on the year's working (1916) shows that 1,697,619 units were sold, an increase of 5.8 per cent. on the previous year's figures: the revenue amounted to \$304,193.42, representing an increase of \$31,418.31, or about 10.3 per cent.; the gross profit was \$201,139.23 (being 19.5 per cent. on the total expended capital, as compared with 18.22 per cent. in the previous year). After paying all charges due to capital there remained a net profit of \$97,703.87, or approximately 9.5 per cent. on the capital expended. At the end of the year the total number of installations being supplied was 2,676, with an aggregate demand of 87,395 30-watt lamps, representing a net increase during the year of 388 installations, with a demand of 10,779 30-watt lamps. During the year capital expenditure was forcibly restricted by war conditions: a spare balancer set (cost \$2,600) was ordered for No. 1 sub-station, and arrived during the year. The total costs per unit sold amounted to 7.74 cents and the works costs

to 6'05 cents. During the year four faults occurred on the mains, three in the old V.B. sheathed cables and one in a lead-sheathed cable; the latter was traced to mechanical damage in connection with repairs to water mains.

In his report Mr. Thomas remarks that the question of the reduction of the charges for lighting and power would doubtless commend itself to the Commissioners in normal times, but having in view the fact that any reduction in charges would be followed by an increase in the number of applications for supply, and would hasten the time when capital extensions in plant and mains would imperatively be needed, it has been decided to make no change until the war is ended.

U.S.A.—A recent issue of *Power* described the remodelling of the Ashley Street station at St. Louis. This plant as originally designed had a capacity of 12,000 kW. (in 1903), made up of five vertical-compound reciprocating engines and generators, with 28 Scotch marine boilers.

In 1905, after the station had been in use a little over a year, it was decided to install four 5,000-kW. turbine units, for which space was found in the engine room, and to provide steam, 40 water-tube boilers were installed on a second floor in the boiler house.

In 1908 it was found necessary to further increase the plant, and 12,000-kW. turbine sets were installed in place of the 5,000-kW. sets, the original condensers and auxiliaries serving for the new plant. Twelve of the old marine boilers were replaced by a similar number of Babcock boilers, and the capacity of the station reached 64,000 kW.

In the meantime, the Keokuk hydro-electric plant was built, and the St. Louis Co. obtained further power from that source for several years.

In 1915, however, it was decided to increase the steam plant by substituting a 20,000-kW. horizontal Curtis turbine set for one of the original reciprocating sets. The generator is a 4,500-volt, 60-cycle, three-phase unit, with four poles, and is rated at 20,000 kW. at 80 per cent. power factor; speed, 1,800 R.P.M.

To supply additional steam, the remainder of the old marine boilers were removed, and 10 modern water-tube boilers replaced them. It is intended to proceed with this substitution by large plant units to bring up the station-plant capacity to 116,000 kW.

Tests on the latest turbine show that it is running well under the guarantees of steam consumption, viz., 11½ lb. per kW.-hour with 1 in. absolute back pressure, 225 lb. steam pressure, and 150° of superheat.

When the present plans are complete, the original station designed for 12,000 kW. will contain an installation of 116,000 kW.

Wigan.—PRICE REVISION.—The Corporation has given notice that the scale of charges for electricity supplied for power purposes by the Corporation to all ordinary consumers will, as from October 1st, 1917, be revised as follows:—For the first 500 units supplied per quarter, 2d. per unit; between 500 and 1,000, 1½d. per unit; between 1,000 and 1,500, 1½d. per unit; between 1,500 and 2,000, 1½d. per unit; and for all over 2,000, 1d. per unit, plus in each case 25 per cent.

TRAMWAY AND RAILWAY NOTES.

Blackpool.—A Corporation car proceeding along Lytham Road on August 25th ran off the line; the driver was injured, and had to be removed to hospital.

Bolton.—The rail wear problem is being solved at Bolton by the employment of the Woods-Gilbert rail planer, recently described in our pages, a couple of which machines are now at work in the borough. On the invitation of the Woods-Gilbert (British) Rail Grinding and Milling Co., representatives of various tramway authorities in Lancashire met at Bolton, last week, to see the machines at work. The borough engineer, Mr. E. L. Morgan, who is responsible for the maintenance of the track, has recommended that 44,667 yards of single rail require to be re-grooved, 16,710 yards to be planed, and a large number of joints treated for "hammering." The contract price for the whole of the work is £6,140. He considers that the cost of removing the corrugations, £1,253, should be charged to revenue, and the balance would thus work out at £383 per mile of track treated. Even if only three years are added to the life of the rails, the saving of the depreciation fund by the extended life of the track will amount to £552 per mile.

Bradford.—HOLIDAY TRAFFICS.—Approximate figures of the tramway traffic during the Bowling "Tide" week—an increasingly popular general holiday for a big proportion of the industrial population, which immediately follows the Bank Holiday period—show greatly increased takings as compared with last year. The bookings of through tickets between Bradford and Leeds for this period totalled 25,200, as against 22,100 for the same period last year, though last year there was a 10 minutes' service, as against a through-car 15 minutes' service this year, owing to labour shortage.

Dover.—A B. of T. inquiry has been held regarding the recent tramway accident, which resulted in 11 persons being killed and 59 injured.

At the Coroner's inquest, held on August 29th, a verdict was returned that the accident was due to an error of judgment on the part of the driver, whom it was considered was too inexperienced.

Glasgow.—The traffic receipts of the Corporation's tramways last week were £25,901, as compared with £23,638 in the corresponding week of August last year, and the number of passengers carried, 7,883,645. The car-miles run were 509,940. Compared with last year, there is an improvement on the receipts since the beginning of the financial year on June 1st, the figures for 1917 being £296,800, as against £264,256.

Ipswich.—In order to save time and expense in the maintenance of the cars, and also in view of the frequent collisions between cars and other vehicles in the streets due to the absence of street lighting, the Corporation has decided that, for the remaining period of the war, the fancy painting of the cars shall be abandoned, and that in place thereof the cars shall be painted two shades of grey with a limited amount of black lining.

Leeds.—A recent statement on the Corporation tramway services shows that the receipts since the beginning of the current financial year have increased by over £1,000 per week on the figures of last year, though last year the total income, for the first time in the undertaking's history, exceeded half a million pounds. The actual figure was £515,806. It is confidently expected that this record will be much surpassed at the end of the present year. The receipts of the first 20 weeks of this year are higher by £22,433 than for the corresponding period of last year.

London.—L.C.C.—The traffic returns of the L.C.C. tramway undertaking for the week ended August 22nd show receipts £58,527, as compared with £49,848 in the corresponding week last year. From April 1st to August 22nd the receipts were £1,146,260, as against £1,002,591 in the corresponding period in 1916.

Manchester.—TRAFFIC CONGESTION REPORT.—The Special Traffic Congestion Committee of the City Council has issued its report, and the far-reaching proposals for dealing with a pressing problem, and involving an estimated cost of a million and a-half sterling, are exciting keen comment. The Tramways Committee had pointed out the need for new arterial roads into the city, and other Committees had reported upon the great traffic congestion in the centre of the city. The Special Committee considers that there should be a limitation of tramway traffic within a certain prescribed area in the centre of the city, that additional arterial routes should be opened out, and that tramway terminals should be established. The following sites are suggested as terminals: Old Infirmary site, St. Peter's Square, Cannon Street, Albert Square, Marsden Square, and Stevenson Square. The Congestion Committee is of opinion that these terminals are absolutely necessary, and by their adoption the number of cars passing along the principal streets in the centre of the city can be reduced by at least 50 per cent.

Nottingham.—Due to a car which was descending Derby Road temporarily getting out of control, several alarmed passengers attempted to jump off, and six of them were removed to the hospital for treatment of their injuries.

Straits Settlements.—GEORGE TOWN (PENANG) TRAMWAYS.—During the 11th year of operation the municipal tramways carried 5,560,398 passengers, as compared with 5,177,874 in the previous year; the car-mileage was 502,731. The total revenue during the year amounted to \$151,408.42, and the operating costs to \$91,735.95, or 18'40 cents per car-mile.

TELEGRAPH AND TELEPHONE NOTES.

Australia-New Zealand Telegraphs.—The first message by the new Eastern Extension cable from Wellington to Sydney was sent by Sir Joseph Ward on August 23rd.

Leeds Wireless School.—Under instruction of the Marconi Co., in co-operation with the Admiralty, the Leeds Education Authority is to undertake the training of wireless operators on a large scale. Early in September a start is to be made with 40 youths, but arrangements are to be made for the provision of training for 200 students at a time, for a six months' course.

South America.—It is reported from Rio de Janeiro that the Brazilian Government has refused to accede to a petition presented by the Marconi Co. for the installation of a high-power station in Amazonas.—*Review of the River Plate.*

CONTRACTS OPEN AND CLOSED.

OPEN.

Australia.—MELBOURNE.—October 10th. Department of the Navy. Pumping plant and equipment for the Commonwealth Naval Dockyard, Cockatoo Island, Sydney. Specifications from the Director of Navy Contracts, Melbourne.

Dublin.—September 11th. Electricity Supply Committee. Twelve months' supply of cables, troughing, bends, section pillars, service boxes, &c. See "Official Notices" to-day.

Dunfermline.—September 6th. School Board. Installation of electric lighting at the Rosyth New School. Mr. D. Gorrie, Clerk to the Board, 104, High Street.

London.—BERMONDSEY. —Sept. 7th. B.C. 500-KW. rotary converter. See "Official Notices" August 3rd.

Stockton-on-Tees.—September 10th. District Fund Gas and Electricity Committees. Stores, &c., for six months. See "Official Notices" to-day.

CLOSED.

Southend-on-Sea.—T.C. Accepted tenders:—

Ransome, Sims & Jefferies.—Four electric 2-ton "Orwell" vehicles, with electric tipping bodies, and "Ironclad Exide" batteries, £932 each. J. G. Brill & Co.—Tramway castings and journal boxes, £44 11s.

Swindon.—Electric bells and fire-alarms for new factory: Napier-Kimber, Ltd.

Tilbury.—U.D.C. Refuse destructor: Heenan & Fronde, £5,308.

NOTES.

Electrolytic Disinfecting Fluid.—During the year 1916, according to the report of Dr. F. W. Alexander, Medical Officer of Health to the Borough of Stepney, 26,790 gallons of electrolytic disinfectant were manufactured, making 53,580 gallons as diluted for distribution. The cost was, for materials, £74; electrical energy, £40; total, £114; on account of the war, the price of materials has considerably increased. Since the installation of the plant, a period of 11 years, 445,569 gallons of the fluid have been manufactured at a cost for electricity of £490, and materials £455 (about 1d. per gallon).

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—

Extract from *London Gazette*, August 23rd:—

COUNTY OF LONDON VOLUNTEER ENGINEERS.—Lieut.-Colonel C. B. Clay (Lieut.-Colonel, late Lancs. Volunteer Artillery) to be Temporary Major (May 15th); E. C. P. Monson (late Major City of London Rifles) to be Temporary Major (second in command) (May 15th).

To be Temporary Captains.—W. D. Bentley, E. G. Fleming, W. Hynam (late Captain, Reserve of Officers), F. M. Yearsley (late Captain, 16th Midx. Volunteer Rifles) to be Temporary Captain and Adjutant (May 15th).

To be Temporary Lieuts.—W. J. A. Watkins, A. J. N. Gerard (May 15th).

To be Temporary Second Lieuts.—P. Bowden, C. E. Campbell. A. Champion to be Temporary Hon. Lieut. and Quartermaster (May 15th).

Officer for the Week.—Lieut. W. J. A. Watkins.

Monday, September 3rd.—Technical instruction (searchlight) for No. 3 Company, Right Half Company, at Regency Street. Drill, No. 3 Company, Left Half Company. Signalling Class, 6.30. Recruits' Drill, 6.30.

Tuesday, September 4th.—Physical drill and bayonet fighting, 7.30.

Wednesday, September 5th.—Drill and elementary bridge construction for No. 1 Company, Left Half Company.

Thursday, September 6th.—Drill and elementary bridge construction for No. 2 Company, Left Half Company. Signalling Class, 6.30. Ambulance Class, 6.30.

Friday, September 7th.—Technical instruction (searchlight) for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Recruits' Drill, 6.30.

Musketry.—All N.C.O.'s and men who have signed the "A" and "B" agreements are required to attend during this month to re-classify in order to enable the corps to obtain the capitation grant. Preference will be given to those men in firing. This does not apply to those who hold the proficiency badge.

Armbands.—The new issue armbands can now be had at Headquarters, and every enrolled man must obtain one without delay; at the same time, all old red armbands (now obsolete) must be returned.

Note.—Unless otherwise indicated, all drills will take place at Headquarters.

(By order) MALEON YEARSLEY.

War Honours.—THE ORDER OF THE BRITISH EMPIRE.—

On August 25th there were published the first lists of men and women who have been appointed to the new Orders instituted in recognition of services rendered in connection with the war. The appointments to the Order of the British Empire include the following:—

Knight Grand Cross.—Lord Emmott, G.C.M.G. (Director of the War Trade Department); Baron Moulton, K.C.B., F.R.S. (Director-General of Explosives); Sir Eric Geddes, K.C.B. (Transportation); the Hon. Arthur Stanley (British Red Cross Society).

Knight Commander.—G. J. Carter, Esq. (Cannell, Laird & Co., Birkenhead); Dugald Clerk, Esq. (Board of Invention and Research, Admiralty, and Ministry of Munitions Inventions Department); C. W. Fielding, Esq. (Chairman of Materials and Metals Economy Committee, Ministry of Munitions); A. E. Herbert, Esq. (Deputy Director-General of Machine Tools, Ministry of Munitions); John Hunter, Esq. (Director of Factory Construction and of Iron and Steel Production, Ministry of Munitions); Prof. H. S. Jackson, F.R.S. (Chemical Adviser to the Optical Research Branch of Ministry of Munitions); L. W. Llewellyn, Esq. (Director of Materials, &c., Ministry of Munitions); Lynden Macassey, Esq., K.C. (Director of Shipyards Labour, &c.); Cecil Partridge, Esq. (Manager and Secretary, Metropolitan Munitions Committee); E. M. Pollock, K.C., M.P. (Controller Foreign Trade Department); Sir Vincent L. Raven (Deputy-Controller, Navy); F. W. S. Stokes, Esq. (Chairman of East Anglian Munitions Committee); Richard Threlfall, Esq., F.R.S. (Advisory Council of Industrial and Scientific Research).

Commanders.—Prof. H. B. Baker, F.R.S., Professor of Chemistry, Imperial College of Science and Technology (Ministry of Munitions); Leonard Bairstow, Esq., F.R.S. (Chief of Aerodynamics, National Physical Laboratory); C. W. Bryant, Esq. (managing director of Messrs. Brotherhoods, Ltd.); J. T. Brownlie, Esq. (Amalgamated Society of Engineers); Prof. W. H. Bragg, F.R.S. (Board of Invention and Research, Admiralty); A. E. L. Chorlton, Esq. (Board of Invention and Research, Admiralty); W. Duddell, Esq., F.R.S. (Board of Invention and Research, Admiralty, also Munitions Inventions Board); A. S. Esslemont, Esq. (Director of Optical Munitions and Glassware); F. W. Harbord, Esq. (Consulting Metallurgist, Ministry of Munitions); A. Laing, Esq. (Wallsend Slipway and Engineering Co.); C. S. Parker, Esq. (Member of the Commission Internationale de Ravitaillement); P. J. Pybus, Esq. (Labour Supply Department of the Ministry of Munitions), Phoenix Dynamo Manufacturing Co., Bradford; Prof. J. F. Thorpe, F.R.S. (Chemical Advisory Committee); Sir G. Croydon Marks, M.P. (Labour Department, Ministry of Munitions).

Officers.—G. Cumming, Esq. (engineering managing director, Harland & Wolff); G. K. B. Elphinstone, Esq. (managing director of Elliott Bros., Ltd.); M. B. Field, Esq. (director of Kelvin, Bottomley & Baird, Ltd.); G. P. Harben (Anglo-Italian Trade Commissioner); Prof. J. C. McLenman (Professor of Physics, Toronto University).

Members.—G. H. Baillie, Esq. (Chief Technical Officer, Labour Supply Department, Ministry of Munitions); R. Clarke, Esq. (Aviation Electrician, Telegraphist, &c., Admiralty); H. Schofield (Principal of Loughborough Technical Institute); W. Simeon (Amalgamated Society of Engineers); C. Taylor (Amalgamated Society of Engineers).

Inquiry.—The maker of the Angelus electric fire is asked for.

Miners' Wages.—The Executive Committee of the Miners' Federation of Great Britain met the Controller of Coal Mines, on Tuesday, and put before him a request for an increase of 25 per cent. on present earnings. Mr. Smillie, the president, and Mr. Herbert Smith, the vice-president, of the Federation, stated the grounds on which the request was based. The Controller undertook to lay the matter before the Government and to communicate the result to the secretary of the Federation at the earliest possible moment. It was reported that the miners in one of the important Midland areas were at present working out their notices, and threatened to come out on strike unless an immediate advance in wage was given. The Controller of Coal Mines and the Executive of the Miners' Federation expressed the hope that no action of this kind would be taken until the Government had had time to consider the application now put forward.

Charity Sports at Chelmsford.—Three large works in the town—viz., Messrs. Crompton & Co., Ltd., the Hoffmann Manufacturing Co., Ltd., and Marconi's Wireless Works Co., Ltd.—carried out a most interesting sports meeting arranged amongst the employees on the ground kindly lent by the Crompton Club, on Saturday, August 25th. There was a record attendance of the public, who not only had an enjoyable afternoon, but also helped three worthy objects—the Essex Regiment Comforts' Fund, the Essex Regiment Prisoners of War Fund, and the St. Dunstan's Hostel for Blinded Soldiers and Sailors. Most of the events were restricted to employees of the works, but the few open ones attracted large entries, many of the men being in khaki. The races were got off in splendid time, the punctuality being remarkable, and upon this the officials are to be warmly commended. In the reserved enclosure were many wounded soldiers from the local hospitals, these being guests. The prize money was kindly provided by the directors of the three companies. The band of the 270th Battalion provided excellent music, and there were amusements of every kind. The Chelmsford V.A.D., under Instructor Runter, were in attendance, but there were no accidents. Mr. Percy G. Cheverton, of Compton's, acted as hon. secretary. The Executive Committee was composed of three representatives from each of the three works. Mr. J. Barker was starter.

The events included running, walking, cycle, hurdle, blindfold, and combination races, and tug-of-war. Crompton's easily secured pride of place in the matter of prizes, winning 9 firsts, 5 seconds, and 5 thirds; Marconi's were second with 5 firsts, 5 seconds, and 3 thirds; while Hoffmann's secured 2 firsts, 5 seconds, 5 thirds. The prizes were distributed by Mrs. Britten, wife of Mr. Thomas Britten, director to Messrs. Crompton & Co., Ltd. Thanks to Mrs. Britten were voiced by Mr. T. Clarkson, and Mrs. Britten suitably replied. Mr. Geoffrey Barrett thanked the hon. sec., Committee, and officials, and Mr. Percy G. Cheverton acknowledged the compliment. In the evening a grand *ad libitum* concert took place on the bowling green, and there was a record attendance; several London artistes appeared. During the interval of the concert, a very popular draw took place, for which 2,500 tickets had been sold. The first prize was a bicycle; the second, two War Savings Certificates; and the third, one War Savings Certificate. There was also dancing, the music being provided by the Yorkshire Regiment Band.

Road Damage by Motor-buses.—Mr. Chapman, the surveyor for Kent, in a report to the County Council on the damage done to main roads by motor-bus traffic, states that 314 miles of county main roads and 104 miles of borough and urban roads carry this traffic. He estimates that 4,550,000 would be required to re-surface with bituminous material those of the main roads not already so treated, including the cost of strengthening the roads, and suggests that legislation is necessary to ensure a more adequate contribution from heavy and high-speed traffic for this purpose.

Strike at Belfast.—With reference to a strike of members of the Electrical Trades Union employed in the tramways department of Belfast Corporation, we learn that a number of men in the electricity department have been called out in consequence. We understand that the dispute arises out of a difference of opinion between the manager of the tramways and the Electrical Trades Union as to whether or not the men engaged in maintaining the overhead equipment of the tramways should be paid the standard rate for electrician's work.

Prohibited Exports.—The Supplement to the *Board of Trade Journal* of August 30th contains complete lists of articles which, according to the latest information received by the Board of Trade, are prohibited to be exported from Denmark, France (including Algeria), Italy, Japan, and the Netherlands. The Supplement also contains the list of articles (complete to date) which are prohibited to be exported from the United Kingdom.

Institution and Lecture Notes.—Iron and Steel Institute.—At the autumn meeting to be held on September 20th and 21st at the Institution of Civil Engineers, London, the following papers are down for consideration:—

- G. Barrett and T. B. Rogerson, "Present Practice in Briquetting of Iron Ores."
- W. J. Brooke and F. F. Hunting, "Microstructure of Commercially Pure Iron between Ar₂ and Ar₃."
- E. D. Campbell and W. C. Dowd, "The Influence of Heat Treatment on the Electrical and Thermal Resistivity and Thermo-Electric Potential of some Steels."
- G. Charpy and A. Cornu-Thenard, "New Impact Testing Experiments."
- J. E. Hurst, "Heat Treatment of Grey Cast-Iron."
- E. F. Law, "Effect of Mass on Heat Treatment."
- T. D. Morgans and F. Rogers, "Investigation upon a Cast of Acid Open-Hearth Steel."
- F. Rogers, "The Acid Open-Hearth Process."
- J. H. Whiteley, "The Eggertz Test for Combined Carbon in Steel."
- E. B. Wolff, "Failure of Boiler Plates in Service and Investigation of Stresses occurring in Riveted Joints."

Mr. Gerard's Disclosures.—In the course of Wednesday's contribution to his work "My Four Years in Germany," in the *Daily Telegraph*, Mr. J. W. Gerard, late U.S. Ambassador in Berlin, mentions a visit paid by himself and Prince Henry, in company with Mr. S. Bergmann, to the Bergmann electrical works. Later he refers to a delayed cable contract as follows:—"Before the war there was but one cable direct from Germany to America. This cable was owned by a German company, and reached America via the Azore Islands. I endeavoured to obtain permission for the Western Union Co. to land a cable in Germany, but the opposition of the German company, which did not desire to have its monopoly interfered with, caused the applications of the Western Union to be definitely pigeon-holed. After the outbreak of the war, in August, 1914, when I told this to Ballin, of the Hamburg-American Line, and Von Gwinner, head of the Deutsche Bank, and when they thought of how much they could have saved for themselves and Germany and their companies if there had been an American-owned cable landing in Germany, their anger at the delay on the part of official Germany knew no bounds. Within a very short time I received an answer from the Foreign Office granting the application of the Western Union Co., providing the cable went direct to America. This concession, however, came too late, and, naturally, the Western Union did not take up the matter during the war."

Hints to Traders with Italy.—The following hints to British manufacturers are taken from the Annual Report for 1916 of the British Chamber of Commerce at Nice:—

"Many German goods are simply cheap imitations of British manufactures. Of course, if and when British labour is fully occupied, it would be undesirable to divert it from making high-grade goods (for which there is a good demand) in order to turn out low-grade goods in which competition is severe. Nevertheless, some German goods, particularly hardware, are exactly suited to certain markets, owing to their lightness and cheapness, and Colonial and foreign buyers often find the German articles more convenient if not of better value. Again, when the British manufacturer refuses to pack his goods in a form convenient to his customers, he deliberately puts himself out of the market. So long as British manufacturers persist in such an attitude they will find it impossible to drive the German trader from the markets where he has been established. At the present time, no doubt, these markets are being tempted to test the dearer and better British goods; but this will not last. In many cases, of course, British goods are better by much more than the difference in price, but where it is impossible to cheapen production the buyer should be stimulated by a more active advertising policy, and by other methods, such as for instance, the placing of goods prominently in wholesale showrooms; the distribution of leaflets setting out in the language of the country the selling points and merits of the particular goods; and by generous advertising in foreign newspapers. The primary need is, however, to supply goods so that they can be disposed of with a minimum of trouble, which is of special consequence where labour is scarce and costly. Another point of great importance is that few manufacturers do their own shipping. They do not realise sufficiently that the price which determines the sale of goods is not the cost at the factory, but the cost delivered in the consumer's market. As regards the ultimate buyer, it makes not the slightest difference whether a low price is brought about by economies in manufacture, packing, freight, or reduction of breakages. If manufacturers are working on too small a scale to do their own shipping at rock-bottom cost, they should either utilise the services of merchants or adopt some co-operative method which will enable them to share in a single efficient and economical selling organisation. If they do their own selling they should

realise that it is as much to their interest to make economies in the packing and shipping of goods as in reducing the cost of manufacture."—*Board of Trade Journal*.

Educational.—CITY AND GUILDS TECHNICAL COLLEGE, Leonard Street, E.C.—The entrance examination for students who have not matriculated will be held on September 18th.

UNIVERSITY OF LONDON, KING'S COLLEGE FACULTY OF ENGINEERING.—Next term begins on October 3rd. For full particulars see our advertisement pages to-day.

THE GOLDSMID SCHOLARSHIP.—The examination for the Goldsmid Engineering Entrance Scholarship at University College, London, value £30 a year for three years, will take place in September. Candidates should apply to the Secretary of University College, London, for full particulars as soon as possible, and not later than September 11th.

Appointments Vacant.—Five assistant foremen for the Government of India Gun and Shell Factory, Cossipore; switch-board attendant (35s.), for the Swindon Corporation electricity works; wireman-jointer, for the Heckmondwike electricity works; men, with experience of up-to-date power station or distributing practice, are wanted by the Rotherham Corporation; assistant mains superintendent for the Darlington Corporation Electricity Department; charge shift engineer (£250) for the L.C.C. tramway generating station; shift engineer for the Eccles Corporation electricity works. See our advertisement pages to-day.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Southend-on-Sea T.C. has declined to allow the electrical engineer, Mr. BIRKETT, to serve two or four days per week for three or four months with the Coal Control Board. The refusal is owing to the depleted staff.

Major W. A. VIGNOLES, borough electrical engineer, Grimsby, has relinquished the acting rank of lieutenant-colonel on ceasing to command a service battalion of the Lincolnshire Regiment.

General.—Messrs. Kincaid, Waller, Manville & Dawson have removed to 3, Central Buildings, Westminster, S.W.1, the Government having requisitioned St. Stephen's House.

In the electrical engineering shop at Rosyth Dockyard, David Adamson, recently a boy writer, was presented with a Carnegie Hero Fund watch for heroism displayed in rescuing a child from drowning. In the presence of members of the staffs of the several departments the watch was handed over by Rear-Admiral H. H. Bruce, Commander Superintendent. Mr. A. J. Ford, of the electrical department, replied for Adamson.

Mr. R. G. SCOTT, of the Sunderland Forge & Electrical Engineering Co., Ltd., was married on Saturday last in the Wearside borough to Miss F. O. Huntley, local organising secretary of the Red Cross Society.

It is announced that the Minister of Munitions has appointed Mr. A. H. Collinson, who is at present Director of Inspection in Munition Areas, to be Controller of Inspection, in place of Sir Sothorn Holland, appointed to the Admiralty for special work.

Roll of Honour.—We regret to learn that Lieutenant J. S. B. PLUMMER, Leicester Regiment, who only returned to France on the 7th inst. (his return was mentioned in our issue of August 10th) is reported by the War Office to be wounded and missing.

Private R. FLOYD, Highland L.L., who has fallen in action, was an apprentice to electrical engineering at the works of the British Westinghouse Co., Ltd., Manchester.

Corporal D. C. DAVIS, R.E., who has been killed at the Front by a bullet from an enemy aeroplane, was formerly on the staff of the Isle of Thanet Tramways & Electric Light Co., Ltd., and enlisted whilst holding an important position with the Argentine Railway Co. at Buenos Aires.

Rifleman A. BURROWS, K.R.R., killed by shell, was employed by the Chloride Electrical Storage Co., Ltd., Clifton Junction.

Rifleman J. CRABTREE, K.R.R., killed in action, was an electrician at Rochdale.

Private T. SCRUFFE, Royal Inniskilling Fusiliers, who is in hospital wounded, was employed on the clerical staff at Rochdale Corporation electricity works.

Private W. PARKER, King's (Liverpool) Regiment, who has died from heart failure after gas poisoning, was employed by Messrs. Dick, Kerr & Co. Private BOWEN, L.N.L. Regiment, also employed by the same firm, has been killed in action.

Second-Lieutenant F. NEWTON, of the Cheshire Regiment, killed in action, was employed by Messrs. Electromotors, Ltd., Openshaw.

Private E. G. WHITEHEAD, Machine Gun Company, Grenadier Guards, of Manchester, who has been killed whilst serving in France, aged 21 years, was employed at the Clayton electricity works.

Electrical Wireman G. E. WILLIAMS, of Marsh Green, Warrington, aged 21, has lost his life at sea. He was serving

on a destroyer which struck a mine. He was a switchboard attendant at the Wigan Corporation electricity works.

Private J. R. BOWES, Loyal North Lancs. Regiment, killed in action, was employed by Messrs. Dick, Kerr & Co., Ltd., Preston.

Private J. WILLIAMSON, Lancs. Fusiliers, presumed killed, after being reported missing, was a former employé of the British Westinghouse Co., Ltd., Trafford Park.

Private N. DENNIS, West Riding Regiment, formerly employed in the Halifax Corporation tramways department, has been awarded the Military Medal.

Corporal T. H. KIRBY, R.F.A., killed in action, was on the clerical staff of Messrs. R. Galsworthy & Sons, electrical fitters, Leeds.

Lance-Corporal J. W. ALBECK, R.E., wounded, was employed at the Bradford city electricity works, Valley Road.

Private J. PRINCE, of the King's (Liverpool) Regiment, killed in action, was employed by Messrs. Dick, Kerr & Co., Ltd., Preston.

Second-Lieutenant JOHN C. JACKSON, Manchester Regiment, reported missing and believed killed, was a student for electrical engineering at the School of Technology, Manchester, prior to the war.

Bombardier W. H. AIREY, R.G.A., who has fallen in action, was on the staff of the Croydon Corporation electricity works.

The Military Medal for bravery has been awarded to Bombardier E. S. HOWARD, R.F.A., who was electrician at the Victoria Hall, York.

Mr. PERCY JOHN PYBUS, who is a Commander of the new Order of the British Empire, and who is described in the honours list as having rendered valuable services to the Labour Supply Department of the Ministry of Munitions, is the managing director of the Phoenix Dynamo Manufacturing Co., Ltd., Bradford, and is at present in charge of hydro-plane construction work. In connection with the work for which he has received his honour, Mr. Pybus carried out an investigation for the Prime Minister with regard to the application of women to the manufacture of munitions, the inquiry leading to the publication of a book by him, entitled "Women on Munitions of War," for which Mr. Lloyd George wrote a preface.

Lance-Corporal C. BISHOP, Sussex Regiment, a former employé of the Brush Electrical Engineering Co., at Loughborough, has been killed in action.

Private J. W. WARDELL, Seaforth Highlanders, who was employed at the power station of the Leeds Corporation tramways, is in hospital at Etaples wounded.

Private R. ASPINALL, of the Loyal North Lancashire Regiment, who was previously reported missing, is now stated to have been killed. He was employed by Messrs. Dick, Kerr & Co., Ltd., Preston.

Signaller J. SHERRINGTON, Heavy Trench Mortar Battery, an employé of Messrs. Dick, Kerr & Co., Ltd., Preston, is in hospital at Leicester, having been gassed in France in July.

Bombardier W. BINGLEY, R.F.A., formerly in the general office of the India-Rubber Co., Silvertown, has been killed in action, and Sergeant F. HIBBARD, R.F.A., formerly in the same department, was wounded on the 17th inst.

Obituary.—MR. J. F. CUMMINGS.—The *Electrical World* contains an account of the career of Mr. James Fulton Cummings, who died on July 26th, aged 48 years. Mr. Cummings was a Canadian, whose electrical work took him to the United States, and after service with some of the best-known electrical organisations there he developed considerable interests on his own account, in connection with underground conduit and interior conduit work. He sold his American patents and business interests in 1897, and came to London, where he opened a large contracting office in the interest of prominent American manufacturers of conduit material. He carried out important installations of this class in this country, also in Milan, Turin, and Petrograd. His father was the author of the Canadian anthem, "The Maple Leaf for Ever."

Will.—The late Captain JOHN CHAMBERLAIN, of Birmingham, left £114,402 gross, and £104,843 net personally.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Wright & Wood, Ltd.—Particulars of £1,000 second mortgage debentures created August 10th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £900. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Spensers, Ltd.—Debenture for £3,250, dated July 30th, 1917, to rank *pari passu* with £7,000 first mortgage debentures and a debenture for £750, and in priority to the second debentures.

Bournemouth & Poole Electricity Supply Co., Ltd.—Capital, £500,000 in 25,000 ord., 7,500 $\frac{1}{2}$ per cent. pref., and 17,500 6 per cent. second pref. shares of £10 each. Return dated March 28th (filed July 11th), 1917. 15,000 ord., 7,500 $\frac{1}{2}$ per cent. pref., and 17,500 6 per cent. second pref. shares taken up; £400,000 paid. Mortgages and charges: £187,500.

Telegraph Manufacturing Co. (Colonial), Ltd. (71,854).—Capital, £2,000 in £1 shares. Return dated March 28th, 1917. All shares taken up. £2,000 paid. Mortgages and charges: Nil.

Tudor Accumulator Co., Ltd. (54,080).—Capital, £100,000 in 8,000 "A" and 1,200 "B" shares of £10 each. Return dated August 7th, 1917. 3,800 "A" and 1,200 "B" shares taken up. £10 per share called up on 2,600 "A" and £2 10s. per share on 1,200 "B"; £29,000 paid, £21,000 considered as paid, being £10 per share on 1,200 and £7 10s. per share on 1,200. Mortgages and charges: Nil. A. B. Pescatore, one of the directors, is a native of Luxembourg. All the others are British.

CITY NOTES.

Oxford Electric Co., Ltd.—Interim dividend of 5 per cent. per annum, less income-tax, on ordinary shares for half-year.

Stock Exchange Notice.—Application has been made to the Committee to allow the following to be officially quoted:—

Madras Electric Supply Corporation, Ltd.—100,000 six per cent. cum. pref. shares of £1 each, fully paid.

Companies to be Struck Off.—The following companies are to be struck off the register unless cause is shown to the contrary within three months:—

Advisory Engineers Corporation.
All-British Electrical Co.
Alphons-Custodis Chimney Construction Co.
Flocher's Electric Fittings.
Fuel Patents Syndicate.
Krupka & Jacoby.
Lighting Supplies.
Magna Time Co.
Midland Magneto Co.
Ship Carbons.

County of London Electric Supply Co., Ltd.—Interim dividends on the preference shares at the rate of 6 per cent. per annum for the half-year to June 30th, and on the ordinary shares for the same period at the rate of 5 per cent. per annum, both less income-tax.

STOCKS AND SHARES.

TUESDAY EVENING.

THERE is a very considerable amount of activity in the industrial market as a whole; and in the animation electrical shares are participating. Not only the electricity supply group is better, but shares in the manufacturing companies are also good, to account for which latter there are interesting rumours afloat. Those whose business leads them into the prosaic paths of stocks and shares are probably in the worst position for judging whether or not such rumours have any truth in them; but, repeating gossip for what it may be worth, report has it that something in the nature of an understanding is on the tapis between a number of the best-known British interests and some of the biggest American companies.

These may be too early days in which to do more than hint at the direction which rumour is taking; and, as just observed, the insider connected with the electrical industry is far better able to judge of the possibility of such a combination of interests than the mere financial scribe. But certainly the recent improvement in some of the manufacturing shares is interesting, to say the least of it, in view of the whispers that are current at the moment.

Among the rises in the shares of the electricity supply companies, this week's include $\frac{1}{4}$ in Metropolitans and $\frac{1}{4}$ in Westminster, while the half-a-score of rises which occurred last week are well held, and there is a noticeable demand for all the best shares. In the manufacturing group, British Aluminium are noticeably good, and have attracted a really large amount of business at 33s. 3d. Although this shows a rise of no more than $7\frac{1}{2}$ d. on the week, the market is a good one, and the improvement follows upon a steady rise within the past two or three months.

Westinghouse preference, too, are firm at 2 11/16, and every day there is a lot doing in the £3 shares of the Edison Co. The price, which a little while ago was 10s., has come up to the neighbourhood of 19s.; and it is generally understood that the shares will be split into £1 shares before the end of the year. Being now regarded as £3 shares, this splitting would mean that on the present basis of 19s., the price would be about 6s. 4d.; and having regard to the demand which there is at the present time for any industrial with good prospects, it is thought that the price may easily improve upon the equivalent of its present position. British Insulated have risen 5s. to 13 $\frac{1}{2}$, following upon their advance of 7s. 6d. last week. India-Rubber 5 per cent. debenture stock at 95 is also harder.

One of our readers asks whether we do not regard India-Rubber shares and Telegraph Constructions as being favourable investments, and our answer is a decided affirmative, though we fear that our correspondent will have some difficulty in picking up the shares. As we have pointed out on previous occasions, the fact that these companies, or any other concerns, have paid in the past their dividends free of tax does not necessarily mean that they will continue the practice in the future, although, of course, they will do all that is possible to maintain the tradition.

The foreign group, with the exception of Brazil Traction, is also strong. Substantial rises have taken place in Mexican

issues, Mexican Electric Light & Power Common being 12 points up. Big advances have occurred in the various other shares of the company, in Mexico Tramways, and in the Monterey and the Pachuca bonds. Confidence is becoming more assured that President Carranza is really friendly to the Allies and to peace, with the result that nearly everything Mexican has appreciated materially. The rise in the price of silver is a minor factor in the situation.

Brazil Tractions have gone back to 48, the Rio rate of exchange being lower. Anglo-Argentine Tramways are better, the first preference hardening to 2 15/16. There have been big rises in various Canadian industrials, including the light and power issues; and a feature of strength during the past day or two is the activity in Pernambuco Trams, the price having risen a shilling or so to 7s.

The Home Railway market is dull, in consequence of the labour position; but the Underground group keeps fairly steady, by reason of the revision of fares on some of the bus routes. This has helped Underground incomes to 83, a rise of 1; but the assented ordinary of the Central London is dull at 60 1/2.

The telegraph market is firm throughout, with the exception of West India & Panama shares. These eased off to 30s. Eastern ordinary at 145 is harder. Cuba Submarine preference rose 10s. to 11 1/2. The Marconi group is quiet. Oriental Telephones and United River Plates are both strong. The revival of activity amongst industrials as a whole has somewhat detracted from the allurements of rubber shares; and the market for these has become less animated, though prices are firm. The armament group is quiet. There has been a renewal of activity and better prices in the shares of various mining companies dealing with base metals.

Energy Released by Boiler Explosion.—Writing in *Power*, Mr. C. H. Berry, Assistant Professor of Power Engineering, Cornell, gives an explanation of the very destructive effect of boiler or economiser explosions, though only moderate working pressures are employed.

Referring to the explosion of a cast-iron economiser, he points out that the displacement of the atmosphere must have been responsible for the displacement of 5,000 sq. ft. of roof, and injury to buildings, &c., as flying fragments of iron would not account for this. The resistance of the atmosphere and sudden movement—its inertia—tends momentarily to blanket the sudden expansion; but this phase passed, and the air is set moving violently, tending to keep moving and thus piling a high pressure against any obstructing object, much as in the case of "water hammer" action.

The work done in moving the atmosphere cannot be measured as a product of its pressure by any change of volume, since this is not a slow pushing back of the surrounding medium, but a sudden movement which necessarily does much work in developing a high velocity of the air.

Since the velocity and the weight of air moved are unknown, it is not possible to compute the energy required to overcome the resistance. Prof. Berry therefore decides that it is impossible to make deductions from the energy liberated on account of atmospheric resistance.

Electrification of Swiss Federal Railways.—The United States Consul at Berne reports that the electrification of the Swiss Federal Railways has now emerged as a very practical economic question. The Government has created a special department, attached to the direction of the Swiss Federal Railways. This department announces that it is prepared to consider proposals for sale and delivery of such electrical material as may be necessary for equipment in connection with this work, and that bids will be received from all countries. A statement by the management shows that large orders for copper wire already have been placed with certain firms in the United States.—*Electrical World*.

SOME NOTES ON BRITISH AND CONTINENTAL ENGINEERING METHODS AND TRAINING.

By A. G. ELLIS, A.M.I.E.E.

(Abstract of lecture delivered before the BRITISH WESTINGHOUSE ENGINEERS' CLUB.)

At no time in history has there been so much discussion of British industrial and trading methods as compared with those of our Continental neighbours, both allied and (chiefly) enemy, which differ in many points from ours. I have endeavoured in these notes to bring out a number of such points which I have observed during several years of engineering work on the Continent.

GENERAL INDUSTRIAL CONDITIONS.

Living and Wages.—Living is, on the whole, rather cheaper on the Continent, but wages and salaries are correspondingly lower. Skilled manual workmen in the engineering trades earn only about 75 per cent. of the hourly rates of corresponding trades in this country. In spite of this, the general conditions of living are better, and thrift is much more observable than among the manual workers in this country.

This is in many cases partly to be attributed to the natural environment and situation of the factories. Only in the largest industrial centres of France and Germany does one meet conditions approaching the congestion and monotony of English manufacturing districts. Apart from these, factories are located individually, or in small groups, in or adjacent to medium-sized towns, from which egress into the surrounding country is an easy matter.

This question of environment has undoubtedly its effect on the morale and life of the manual workers, which is especially noticeable in the industrial districts of Switzerland. In that country, partly by reason of the brighter environment, and partly because of the innate democratic nature and the national educational system, the manual workers are remarkably thrifty and independent, and in general living are very simple and hygienic.

The same ends (apart from independence) are reached in Germany, for instance, by means of official inspection and control.

An important factor in this question is that of housing. On the Continent nearly everyone, including the manual workers, live in flats, built in blocks of usually three to five stories with common gardens behind. Central heating and electric lighting are common, and rooms larger and better arranged than in the orthodox five- or six-roomed small house are obtained. Such blocks do not generally suffer from the depressing "soullessness" of the working people's tenement dwellings found in the industrial cities in England.

There is also a greater tendency among the working people to build their own dwellings, which is fostered and assisted by the popular banks, who make a practice of lending money for such purposes at low rates of interest.

Relations of Capital and Labour.—In every European country there continually arise practically the same questions between Capital and Labour. In general, the relations between the two parties appear to be more cordial the more democratic the country, and, conversely, the more difficult the more autocratic the country.

To take two extremes: In Germany, Socialism is strong and discontent is fairly rife among the manual workers, but it rarely gets under way owing to being kept down under the iron heel of militarism; in Switzerland, on the other hand, democracy is advanced to such an extent that employés are often shareholders in the industrial concerns they are working with, and there is seldom, and little, industrial discontent.

Trade Unions exist in all the industrial countries, but they are usually wrapped up in Socialistic propaganda, and are generally not nearly so powerful as in England.

Technical Staff.—Salaries of the technical staff are also rather lower than in England, but living and travelling are cheaper. For young, single engineers life is less of the dreary proposition it often is in England, as good apartments are more readily obtainable, and more generally developed restaurant life renders the restaurants and "Bier-halle" very habitable places. At least one of the large European firms has built a colony of houses for its staff and their families, which are let out as single villas, or as two or three flats at moderate rentals.

The lower scale of salaries is partly due to the over-production of university-trained engineers in Germany during the past 10 to 15 years. This has led, incidentally, to a better class of man, technically, being available for intermediate and lower positions, such as draughtsmen, test assistants, &c.

The bonus system has been generally in vogue for a good many years, with satisfactory results. The actual amount is determined by the individual work accomplished, initiative, and personal relations with other departments and individuals.

Rents, Rates, and Taxes.—On the whole, the sum total of house rent, rates, and taxes approximates to the same figures

as in England, though living, travelling, and amusements cost generally rather less.

Working Hours.—The total number of working hours per week for workshops and offices is approximately the same in England and on the Continent. Works hours for manual workers total 52.53 hours per week, and office hours average 45 hours per week. Up till recent years it was quite common practice to work right through Saturday afternoon, and this practice has never been abandoned or relaxed in France. This is not without its influence on the physique and morale of the race. The British traditional Saturday afternoon of sport is, on the whole, much more beneficial, even to working capacity, in the long run.

GENERAL WORKS ORGANISATION.

Relation of System to Size of Firm.—Up to a certain point the organisation on any industrial undertaking is practically the same anywhere. There are usually three main divisions:—

1. The technical side, comprising engineering, design, and manufacture.

2. The sales side, comprising selling, publicity departments, &c.

3. The commercial side, comprising the accounting, purchasing, and similar departments.

Beyond this point the organisation depends to a large extent upon the size of the undertaking and the number of employés.

Small Continental firms generally have the whole of the engineering work grouped together in one common design office and one general drawing office. This is the most workable and efficient plan for small undertakings. In the larger Continental firms it has been found necessary to sectionalise the departments according to the class of machine or apparatus manufactured.

The sales departments are also similarly grouped in the general sales office in the case of small firms, and sectionalised according to the different classes of machinery in large firms, the necessity for which is obvious when dealing with large amounts of business.

Comparison of British and Continental Practice.—Turning now to British organisation of medium and large firms, we find a compound of the above two systems. In a typical organisation, certain specialised departments, such as traction, transformers, and apparatus, are segregated from the main engineering departments, while others are left collectively under the general engine and machine departments. This segregation is carried out for the same departments on the sales side, the engineering and sales divisions being located in close proximity, and working in close co-operation. This point is a step in advance of the organisation adopted by large Continental firms, and I should say it forms the most satisfactory basis for the organisation of a large works.

Probably the most efficient working would be obtained by also sectionalising the factory as far as possible into a number of component factories producing each one class of machine or apparatus, under the control of the corresponding engineering unit working in conjunction with its own sales department.

The standardising department prepares lists of all standard materials, parts, tender and specification forms, &c., and the department chief is charged with lining up the general practice of, and ensuring co-operation between, the several engineering departments, to prevent unnecessary waste and overlapping. This is of great importance in reference to economising on stocks and sizes of frames, copper, angle irons, &c., and it is, in fact, a very live department if properly organised. It is not sufficient that a certain amount of necessary standardisation of parts and stocks common to all engineering departments has been done once and for all, but it is essential continually to line up progress in all the different departments, and thus reduce development expenses by preventing overlapping.

Research.—Research departments are not far developed in other than a few of the leading engineering works. In general, research work is conducted on much the same scale and in much the same way as in England. A large amount of investigation is carried out at the technical high schools and universities, but this often suffers from the common complaint of being too academical. In the engineering works, though the largest firms have their own research laboratories, this work is not carried on on anything like such a lavish and far-reaching scale as in America. What is missing on the Continent, as in this country, is a comprehensive scheme of co-operation for the systematic carrying-out of research work, and distributing the results and preventing overlapping and repetition.

Weights and Measures.—The advantages of the metric and decimal system of weights, measures, and money in universal use on the Continent are nowadays sufficiently apparent to be past controversy.

In this country our conservative clinging to unwieldy and cumbersome systems of weights and measures handicaps our business in foreign markets, and is responsible for considerable waste of time and many errors, particularly in engineering work.

The influence of Continental engineers who have been employed in responsible positions by British firms is observable in some quarters in a mixture of metric and British units

in calculation and design work. Such a state of affairs is, if anything, more hopeless than sticking to one system, however bad.

Another point I would make is that of ease of conception of magnitudes in the metric system. Small magnitudes are expressed in millimetres, and the magnitude of the millimetre becomes a clear and fixed quantity to the mind and to the eye.

In general, I believe that the presumed difficulties in changing over and getting used to a new and rational system, even for the man in the street and the old woman in the market, would be found not nearly so insurmountable as has been supposed. The sweeping changes in national ideas and conventions since the war have demonstrated the rapid adaptability of the British national mind, and, in addition, the influence of closer contact with the Continental nations since the war renders the present time (or the immediate after-war period) very suitable for such a change.

Relations between Manufacturers and Customers.—General business relations, conditions of sale, terms of payment, &c., do not differ to any extent in most of the Continental countries from those obtaining in this country. Technical relations between manufacturers and customers, however, differ considerably, being more co-operative on the Continent than in England.

Industrial Banks.—The first reason for this is that a large part of the engineering business for the Continental market is conducted through the industrial banks which finance industrial concerns and power schemes, ensuring a market for their manufactures.

The largest German electrical and manufacturing concern is conducted on these lines, this undertaking comprising not only machine factories and power schemes, but also mines and factories for the internal supply of raw material. Under such conditions, a large demand for manufactured machines is automatically created, which facilitates production in large quantities (massenfabrikation), which, with the cheap supply of raw material, results in low cost of production and consequent easy competition in the open markets. This has been one of the important factors underlying German competition in the world's markets.

In concerns financed by subscribed capital, and not by the industrial banks, there are also instances of correlated power companies who finance and engineer large power schemes, for which the necessary machinery and apparatus is automatically ordered from the mother manufacturing company. This ensures a certain minimum "load factor" of works production at reasonable prices.

Consulting Engineers.—The second reason for the closer co-operation between manufacturers and customers is the practical absence on the Continent of the consulting engineer. This is chiefly due to the method of conducting affairs referred to immediately above. By reason of this, the consulting engineer has become practically short-circuited and superseded by skilled engineers on the staffs of the manufacturing and power-scheme companies who are, as a matter of fact, more intimately in touch with the conditions obtaining and manufacturing possibilities. The result is certainly beneficial, and leads to closer co-operation and sounder engineering work.

Standardisation.—Closely related to this question is that of standard specifications and standard apparatus. In this country it appears that practically every individual consulting engineer and power company issue their own pet specifications for electrical machinery, and seldom are content with the manufacturers' standard apparatus. Even the Standardisation Rules of the Engineering Standards Committee appear to be specified only in the minority of cases. Apart from the question whether these rules represent the most desirable set of specifications, it is to be deplored that they should not be more widely adopted by purchasers of electrical machinery.

The lack of uniformity in different customers' requirements (the difference often being of relatively little importance) necessitates manufacturing numbers of special types of apparatus, resulting in needless loss of time in offices and works, and increased cost of production.

On the Continent, the state of affairs is just the reverse. Each country of importance has its own set of standardisation rules, issued by an authoritative body representing the industry.

The German rules for electrical machinery (issued from year to year by the V.D.E., corresponding to our I.E.E.) are adopted by all the German, Austrian, and Swiss firms, and most of the rules of other countries (among them France, Belgium, Russia, and Italy) follow them very closely. The consequence is a fairly uniform specification throughout Europe, as the standardisation rules are respected and worked to by practically all manufacturers and customers' engineers.

The manufacturers are thus in a position to standardise and get out lists of their apparatus in accordance with the standardisation rules, and they are sufficiently strong to compel the customer to accept their standard apparatus, or go elsewhere, if possible.

This is the fundamental difference between this country and the Continent in this important matter. I know of one instance where a Continental manufacturing firm some years ago gave up the idea of English business, in spite of the "open door," solely on this account.

Electrical Machinery for British and Continental Markets.—I will only refer to the three principal specification conditions for electrical machinery, viz.:—

- (a) Temperature rise.
- (b) Overload capacity.
- (c) Insulation tests.

(a) and (b). In the matter of temperature rise there has been a certain amount of timidity in this country. The general figure for the temperature rise of electrical machinery at continuous normal load on the Continent is now 60 deg. C., while according to the British standard rules it is 50 deg.—55 deg. C.

Here we still find many different individual customers or consulting engineers each specifying a different temperature rise, ranging from 30 to 50 deg. C., and often after varying periods of time. The usual reason given is the different degree of overload required, according to the duty the machine has to perform, some preferring what they call a "liberally rated" machine.

This leads also to a variety of specifications as regards overload capacity. The most rational way to designate a machine is by its *normal continuous rating at the standard temperature rise*, for which rating standard overload capacities are available. The size of machine can easily be selected by determining the permissible normal rating in conjunction with the overload capacity required. In the case of machines for varying load (crane, rolling mill, traction motors, &c.) the normal rating should be determined from the root-mean-square value of the load diagram.

(c) As regards insulation tests there is less discrepancy of ideas in the different countries. This uniformity is at least gratifying, but it prompts the question why we should not be able to establish international standards. There is, after all, little radical difference between British and Continental machinery (electrical or otherwise), and it is to be hoped that in the course of time the International Electrotechnical Commission will be able to achieve something in this direction.

Tolerances.—In the various standardisation rules I find no standard tolerances to guarantees specified, although it is not uncommon for manufacturers to demand such, both on the Continent and in this country.

Most of the large Continental firms have these tolerances scheduled and prescribed in their standard lists. There have been cases of a firm utilising part of the tolerance in order to present apparently better guarantees than correspond to reality, a practice which is to be deprecated.

General Applications of Electricity.—In the utilisation of electrical energy for factories, mills, shipyards, public lighting and tramways, and suburban railways, we are as far as, and in some cases further advanced than, on the Continent. Main-line electrification has, however, gone ahead quicker across the Channel, notably in Italy and Switzerland.

A good deal might be done in this country on Continental lines in the more general domestic application of electricity, partly as an aid to the solution of the servant problem. On the Continent the use of electricity for village lighting, cooking and heating, and driving of looms and machines for home industries is very widely developed. The application of electricity to agricultural machinery, at any rate in the mid-European countries, is also far developed.

It is usually thought that this is the outcome of cheap electrical energy being obtainable from the large sources of water power available. So far as I have seen, electrical energy is not, on the whole, very much cheaper on the Continent than in this country, and against this must be taken into consideration the fact that wages are generally lower.

The domestic use of electricity is facilitated by the simplicity of house and shop wiring, covered wires being run on porcelain cleats on walls and ceilings without casing or tubing; also by the ease in connecting-up small consumers to the distributing networks, which are usually bare overhead wires on wood poles in the smaller towns and villages.

Of course, we have been handicapped to a certain extent by being pioneers, and also by the Board of Trade limit of 20,000 volts transmission voltage. It is to be hoped that the after-war period of development will see the removal of this limit, and the development of high-tension overhead transmission.

Training of Engineers and Manual Workers.—It is generally reckoned that the educational system of the majority of the European countries is more highly developed than in England. The chief point of contrast is the continuous national system, from the primary school to the University, usually found on the Continent. While in England individual sections of our educational systems, notable the public schools and universities, do not show up at any disadvantage, there is a serious handicap in lack of continuity throughout the whole system.

Training of Skilled Engineers.—For the training of skilled engineers the Continental system follows the invariable course of primary school, intermediate school, technical preparatory school, technical high school or university. Attendance for a prescribed number of years in each is obligatory in order to become a diploma engineer.

In this country a youth is taken straight from a secondary or public school to a technical college or university without any preliminary technical education. The result is that a large amount of technical ground has to be covered during the first year, at such a rapid rate, that it is difficult to assimilate it properly; nevertheless, it is remarkable how

rapidly English students pick up and progress during the remaining years of study.

The English engineer is finished sooner than the Continental, and at the age when the latter has finished his studies and works experience the former has already had several years of valuable practical experience, and is of more use to the industry, and a better man for his job. This often shows itself in the young engineers in England being more practical, and on the Continent being more academic.

On the whole, the finished product of the British technical college or university shows up quite favourably against the Continental. This statement must, however, be qualified for the partially-trained men in intermediate positions.

On the Continent there is generally more or less systematic training to be obtained for draughtsmen, test assistants, erection engineers, and the like, for whom no specific course of education obtains in this country. On the Continent such positions are usually filled by men designated "Techniker," usually drawn from the more intelligent artisans and trade apprentices, who spend two complete years at a technical school, the "Technikum." This school is not of university rank, and men who have taken its courses do not rank as engineers, though a certain number attain to positions usually filled by university-trained men. So far as I have seen, the average level of capability and intelligence of draughtsmen and the like is thereby greatly enhanced.

Training of Manual Workers.—The trade apprentice usually enters works at about the age of 14 years, as in this country, and continues his education systematically at the national schools in subjects connected with his particular trade. These classes are compulsory for regular trade apprentices, and are held during working hours on several afternoons of each week, the apprentices being granted the necessary leave to attend them regularly.

It is only of recent years that attempts have been made in this country to secure continuation schooling for trade apprentices during works hours, and this has been by individual effort. On the Continent, such schemes have been in vogue and under national supervision for many years, and the beneficial results are apparent.

A proper scheme of apprentice training should be incorporated in a reorganised national system of education in England, under the central education authority controlling a continuous scheme of education up to the technical colleges and universities.

SECOND REPORT OF THE COMMITTEE FOR THE INTERCONNECTION OF THE LANCASHIRE AND CHESHIRE ELECTRICITY SUPPLY SYSTEMS.

(Concluded from page 191).

49. The total capacity expended by municipalities on power stations, mains, and sub-stations in the area covered by this report is £7,425,266, of which £3,166,274, equal to 43 per cent., has been paid into the sinking fund, and the outstanding capital indebtedness is £4,339,183.

In addition to the amount paid into the sinking fund, there stands to the credit of reserve and renewals funds a total of £337,672.

The capital expenditure of companies on power stations, mains, and sub-stations amounts to £1,341,690, of which £126,567, equal to 9 per cent., has been written off.

50. A joint board, constituted on the lines set forth in Clause 4, consisting of nominated or elected representatives of all the statutory authorities in the area, together with an advisory committee of engineers, would, in the opinion of the Committee, form the most suitable authority to exercise full statutory powers in regard to all power stations and transmission lines in the area of Lancashire and Cheshire.

These representatives and engineers have for many years had a close and intimate knowledge not only of the possibilities of economical production from the supply authorities' point of view, but also of the requirements of the various industries established in the district.

A board so constituted might be relied upon to furnish the necessary enterprise to develop the power supply business in the best interests of the industrial community.

51. In Lancashire and Cheshire the majority of electricity undertakings are owned and operated by municipal authorities. Amongst these undertakings are some of the largest and best-equipped stations in the country, and the prices charged for industrial purposes compare favourably with the lowest charges made elsewhere. There would appear to be no valid reason, therefore, why the present measure of control by municipalities should be disturbed in setting up the constitution of the joint board, the important point being to constitute one single authority for the whole area so that future developments can be co-ordinated along sound, technical, and commercial lines.

52. The Committee feel that the time has passed when power to generate electrical energy, which is so vital to the interests of the trade of the nation, and to the efficient employment of the nation's principal source of wealth, i.e.,

coal, should continue to be exercised solely for the purpose of supply within a limited area, and, in order to deal efficiently with future requirements, they consider it essential that extensions of existing power stations or the provision of new power stations should only be proceeded with after due consideration has been given not only to the requirements of the particular area in which such power stations may be situated, but also of the actual or potential requirements of the surrounding districts. In other words, the provision of efficient generating plant has ceased to be a matter which only concerns each separate undertaking as at present constituted, but has become an important element in the welfare of whole districts, without regard to municipal or other boundaries.

53. In order to secure the most efficient results, developments should take place along the following lines:—

(a) Large units of plant—of not less than, say, 10,000 kW. to 15,000 kW.—must be provided in order to obtain the most economical employment of capital expenditure.

(b) Such plants must be concentrated in the most suitable localities for the purpose.

(c) High-tension transmission lines for interconnecting purposes must be constructed between the large power stations, so that the large plants may be used to the greatest advantage.

(d) All suitable sources of waste heat must be utilised.

By effecting these changes not only would there be a considerable reduction in the annual costs incidental to a lower capital expenditure per kW. of plant installed, but there would be an enormous saving in the fuel consumption per unit generated, in addition to reductions in other working expenses.

54. The Committee would point out that under these proposals supplies would be given to authorised distributors at cost prices, and, whilst reserving to the authorised distributors their full and existing rights under their provisional orders, it may be necessary to introduce safeguards to ensure that the advantages of cheap production arising out of a federation of interests shall not be neutralised by the distributing authorities charging unduly high prices to the consumers within their area.

The Relation of the Joint Board to the Existing Government Departments, or to any New Electricity Tribunal that may hereafter be set up.—55. The Committee are in accord with the recommendation tendered to the Board of Trade Electrical Trades Committee, advocating the appointment of a new tribunal consisting of a limited number of electricity commissioners, who would be entrusted with the jurisdiction of matters affecting the supply of electricity.

56. The Committee would go further, and suggest that the commissioners should be the central authority in technical matters, and should possess all other powers now exercised by Government departments, and such other powers as may hereafter be conferred upon them by Parliament, with regard to electricity supplies for the whole country.

57. The establishment of the one single authority referred to above for owning and operating the power stations and high-pressure transmission lines in the Lancashire and Cheshire area does not appear to the Committee to be inconsistent with the proposal to set up electricity commissioners.

58. On all technical matters the advisory committee of engineers to the joint board would form the medium of relationship between the central authority of the electricity commissioners and the local joint board.

Summary of Committee's Further Recommendations.—59. Inasmuch as the interconnecting proposals are but the preliminary steps in the direction of co-ordinating the existing undertakings, the Committee would strongly recommend that favourable consideration should be given to the proposals set forth in the latter sections of the report, namely:—

That in addition to the powers conferred upon the joint board (as set forth in Clause 7) for the purpose of interconnection, the board should also possess powers enabling them to erect new power stations and to acquire—when and where desirable—the ownership, control, and operation of all or any power stations (existing and future), and all high-pressure transmission lines.

60. That a new tribunal, consisting of electricity commissioners, should be set up to administer the powers now exercised by Government departments in relation to electricity supplies, and such other powers as may hereafter be conferred upon them by Parliament.

61. *Note.*—The signatories to both sections of this report wish to make it quite clear that the recommendations and suggestions contained in the report represent their own personal opinions, and do not necessarily represent the views of the respective undertakings with which they are connected.

S. L. PEARCE, Chairman.	
B. WELBOURN, Vice-Chairman.	
J. A. ROBERTSON, Hon. Secretary.	
S. E. BRITTON,	} Members of the Committee.
H. DICKINSON,	
S. J. WATSON,	
P. P. WHEELWRIGHT,	
W. J. H. WOOD,	

July, 1917.

Sir John A. F. Aspinall, Mr. Edwardes, and Mr. Purrett do not sign this section of the report, owing to the position that would be created for their companies if the foregoing proposals were given effect to.

Mr. Blackmore does not sign this section of the report, as he is not in agreement with the proposals to invest the joint board with the following powers:—

1. The purchase of the existing power stations owned by the municipalities.
2. The purchase of the undertakings owned by the companies.
3. The erection of new power stations.

Schedules attached to the report contain the following particulars relating to the method employed in determining bulk and reciprocal supply costs:—

BULK SUPPLY COSTS AT BUS-BARS OF STATION SUPPLYING.

Load factor 30 per cent.

(a) CAPITAL CHARGES.

Cost of installing complete plant, using modern sets of not less than 5,000 KW. ...	Per KW.D.
Depreciation or sinking fund = 5 per cent. per annum on 16 years average life of assets.	
Interest	= 5 per cent. per annum.
Total charges on capital ...	= 10 per cent. per annum.
10 per cent. on £10 ...	= £1 per KW.D. per annum.

(b) WORKING EXPENSES. (Generation.)

Coal (stand-by)	} = £1 6s. per KW.D. per annum.
Oil, waste, water, and stores	
Wages and salaries	
Repairs and maintenance	
Management	
Rates and taxes excluded.	

(c) COAL. (Running.)

At 17s. 6d. per ton = 168d. per unit delivered to feeders.
Provision should be made for a variation in the price of fuel, viz., 1001d. per unit corresponds to an increase or decrease of 1d. per ton.

Note.—In the fuel costs is provided a sum sufficient to cover the removal and disposal of ashes.

(d) SUMMARY OF COSTS.

	Per KW.D. per annum.
Fixed charges.—Capital charges	£1 0 0
General working expenses	1 6 0

£2 6 0

Running charges.—Coal 168d. per unit delivered to feeders.

The following additions and deductions are suggested for load factors other than 30 per cent.:—For a load factor of 50 per cent. and over, a deduction of 5s. per KW.D. per annum; 15 per cent., but under 50 per cent., a deduction of 3s.; 40 per cent., but under 45 per cent., a deduction of 2s.; 35 per cent., but under 40 per cent., a deduction of 1s.; 30 per cent., but under 35 per cent., basic charge; 25 per cent., but under 30 per cent., an addition of 2s.; 20 per cent., but under 25 per cent., an addition of 6s.; 15 per cent., but under 20 per cent., an addition of 14s.; 10 per cent., but under 15 per cent., an addition of 22s.; below 10 per cent., an addition of 34s.

Over-all costs per E.H.T. unit at station bus-bars, with coal at 17s. 6d. per ton, for varying load factors:—Load factor of 50 per cent. and over, 280d.; 45 per cent., but under 50 per cent., 298d.; 40 per cent., but under 45 per cent., 318d.; 35 per cent., but under 40 per cent., 341d.; 30 per cent., but under 35 per cent., 377d.; 25 per cent., but under 30 per cent., 430d.; 20 per cent., but under 25 per cent., 524d.; 15 per cent., but under 20 per cent., 715d.; 10 per cent., but under 15 per cent., 1100d.; below 10 per cent., 1440d.

RECIPROCAL SUPPLY COSTS—LIGHT LOAD PERIODS.

	30 per cent. load factor.	Per KW.D. per annum.
(a) 33½ per cent. of the capital charges		£0 6 8
(b) 25 per cent. of the general working expenses		0 6 6
Total		£0 13 2

(c) Running charges with coal at 17s. 6d. per ton = 0168d. per unit delivered to feeders.

Subject to the same provision for a variation in the coal price as in the case of bulk supplies.

For load factors other than 30 per cent., the corresponding values given for bulk supply "capital charges" and "general working expenses" would be taken, but the above percentages of 33½ and 25 per cent. would still apply.

Manganese Dioxide in Canada.—A message from Calgary, Alberta, to the Central News, says that practically inexhaustible deposits of manganese dioxide have been found in the Cypress Hills, in South-East Alberta. Eight hundred thousand tons, worth approximately £11,000,000, have been blocked out in the last few months. The manganese lies at the surface of the ground, and, therefore, the deposits are very easily worked. The staff of the Department of Mining of the University of Toronto have discovered a process by which low-grade concentrates of molybdenite can be made at little cost. The new process will render available the deposits of low-grade molybdenum ore which have been discovered in Manitoba and British Columbia. *Financial Times.*

INDUSTRIAL RESEARCH.

THE second annual report of the Committee of the Privy Council for Scientific and Industrial Research (the first part of which is abstracted elsewhere in this issue) is characterised by a practical spirit which augurs well for the success of its important undertakings. The Committee has a very difficult task to accomplish, and is cultivating ground which has hitherto remained almost unbroken; in order to reap a satisfactory harvest within a reasonable period many weeds will have to be uprooted—the jealousies of rival firms, the bonds of traditional secretiveness, the inertia of old-established firms, the inefficiency or total absence of organisation in certain trades, and other adverse influences; but by avoiding the attempt to establish rigid lines of procedure, and by showing a disposition to treat every question that arises, on its own merits, the Committee has retained an elasticity of administration which immensely facilitates the progress of its work, and affords good grounds for confidence in the ultimate success of its endeavours. Quite typical of this elasticity is the decision of the Government to allocate a sum of one million sterling for expenditure spread over a period of five years, instead of an annual subsidy which must not be exceeded, while any balance that remained, being re-absorbed into the State funds, would not have been available to augment the allowance in the following year. Thus the hands of the new Department are set free to cope with any conditions that may arise, and to provide for initial outlay on a generous scale, such as is likely to be found essential to the rapid promotion of important researches. One million pounds would not suffice to build a single battleship; but in the light of past experience, of the rich returns already derived from the meagre allowances doled out to the National Physical Laboratory in pre-war times, and of magnificent results accruing from the outlay on researches in connection with optical glass, dye-stuffs, and other war-time necessities, there is no room for doubt that the expenditure of this modest capital will not only provide its own justification, but will quickly lead to the devotion of vastly greater sums to this most profitable service.

Another welcome trait which marks the Committee's proceedings is the readiness which it manifests to take its own medicine, and to co-operate cordially with any and every Government Department or public body whose aims are in harmony with its own, or whose specialised knowledge can be utilised to the national advantage. It is, to our mind, of the utmost importance that the wealth of

knowledge and experience which is represented by our great scientific and technical societies should be drawn upon most freely, and that their advice should be sought and duly weighed before any important action is taken by the Government in industrial affairs. This course has not been followed in the past; the officials whose influence in Government Departments is paramount have usually, whether intentionally or in blank ignorance, refrained from consulting such bodies, with the natural result that their decisions have often done more harm than good to the industries they professed to help. Our Government is, in fact, far more bureaucratic and reactionary than the public generally are aware, and this is largely, if not entirely, owing to the narrow classical curriculum of the public schools, in which history, geography, and science are practically ignored.

While the exceedingly valuable results already obtained in various applications derive their origin mainly from independent researches that were set on foot by the Government, with the assistance of the Board of Scientific Societies, soon after the outbreak of war, and by our scientific and industrial associations, long before the Committee was appointed to organise research, they are of the same order as those which may be expected to accrue from the efforts of the Department, which, moreover, has taken steps to ensure their continuance, and to extend their scope. The Committee does not pretend that the nation "will reap the fruits of these preparatory labours" until after the return of peace. Nevertheless, good results are beginning to flow in from the new work put in hand by the Committee, which is methodically laying a sure and solid foundation for the development of industrial research. Unfortunately, owing to the exigencies of the time, the Committee has found it impossible to devote attention to the subject of research in pure science, but it recognises that this is the seed with which the industrial field is sown, and that to neglect it would be a fatuous error. We must see to it that the Committee shall not fail to discharge its duty to pure science at the earliest possible moment—otherwise its labours will prove futile.

Lastly, we commend the attitude of the Department towards the rights of the inventor, whom it appears determined to encourage and support. Invention has too often been the mother of necessity, and the poor inventor in particular ought to be protected and assisted.

Our Commercial Intelligence Service.

In our last issue, in referring to the decision to appoint additional Trade Commissioners, we mentioned that the Cabinet had given its approval to the scheme for re-organising the Commercial Intelligence Service of the country by bringing the operations of the Foreign Office and of the Board of Trade in this connection under unified control. The full details of this scheme are now published in the form of a Memorandum, which was reprinted in the *Times* on August 31st. As would be expected, difficulties were encountered when those responsible for dealing with the matter tried to define and adjust the limits of responsibility of the Foreign Office and the Board of Trade with respect to the collection and distribution of commercial intelligence obtained through the medium of the Commercial Attachés and Consuls in foreign countries. A Committee which, in addition to eminent men from the two Departments, included Lord Faringdon, Mr. Dudley Docker (Federation of British Industries), and Mr. Pennefather, M.P., representing the

Chambers of Commerce, sat to try to solve the difficulties, but these gentlemen were not able to arrive at a unanimous agreement. They agreed that the control of the Commercial Attachés should be left to the Foreign Office, acting in consultation with the Board of Trade as regards instructions and appointments, and that both this service and the Consular Service should be enlarged and improved. Another Committee has been appointed to carry these recommendations into effect with the least possible delay. Where the Committee could not agree was on the question of whether the work of collating and distributing commercial intelligence from foreign countries among the commercial community in this country should continue to be performed by the Department of Commercial Intelligence of the Board of Trade or should be dealt with by a Department to be created at the Foreign Office. The majority of the Committee favoured the work being done by the Foreign Office. The two Departments, therefore, considered the matter further, and arrived at a scheme, which has been approved by the War Cabinet, and is set forth in detail in the Memorandum from which we quote below:—

An enlarged Commercial Intelligence Department will be created on a scale adequate to meet the reasonable requirements of British trade after the war. Parliamentary control over the Department will be exercised through a new Parliamentary Secretary, who will occupy the position both of Additional Parliamentary Secretary at the Board of Trade, and also Additional Parliamentary Under-Secretary for Foreign Affairs. This Parliamentary Secretary will be responsible to the President of the Board of Trade for all matters within the competence of that Department, and responsible to the Secretary of State for Foreign Affairs for all matters concerning the Foreign Office. By matters concerning the Foreign Office is meant all questions concerning the direction and organisation of the Commercial Attaché and Consular Services and the commercial work of officers of these services, and of the Diplomatic Service, so far as these matters are not dealt with by the Consular or other Departments of the Foreign Office, and also matters concerning the personnel of the Foreign Office and of the above services who may be temporarily attached to the Department, and any matters arising out of the work of the Department involving questions of foreign policy. All instructions issued to Commercial Attachés or other Diplomatic or Consular Officers will be issued in the name of the Secretary of State for Foreign Affairs. On all other matters the responsibility will lie with the Board of Trade. The Commercial Intelligence Department will eventually comprise the existing Department of Commercial Intelligence of the Board of Trade and the Foreign Trade Department of the Foreign Office, and will take over such of the staff and records of the War Trade Intelligence and Statistical Departments as may be available and required.

The official head of the Department will be an officer appointed jointly by the President of the Board of Trade and the Secretary of State for Foreign Affairs, working under the new Parliamentary Secretary. The appointment and control of the Trade Commissioners within the Empire will, as at present, rest with the Board of Trade, and the appointment and control of the Commercial Attachés and Consular Service with the Foreign Office, but the work of the new Department will comprise all matters dealing with commercial intelligence, and, so far as is necessary for that purpose, it will give directions to the overseas services and make the necessary arrangements for keeping them in close touch with the commercial classes in this country.

There will be a constant interchange of staff between the Department and both the Foreign Office and the Board of Trade, so that members of those Departments may be thoroughly acquainted with the work. The Department will be assisted by an Advisory Committee of business men.

Duality of control is one of the great errors that has been developed in connection with such matters in the past, and the foregoing represents a serious effort to devise means for getting rid of it. The end sought by those who have devoted so much anxious thought to the scheme is to secure that the direction of the commercial work of the foreign services and the distribution of commercial intelligence collected by them shall be under a single Department, which shall also direct the activities of the enlarged Trade Commissioner service. It is anticipated that by so doing there will be assured a uniformity of policy for our entire overseas trade.

THE MODERNISATION OF STUART STREET GENERATING STATION, MANCHESTER.

THE history of the Stuart Street generating station will be found to synchronise very closely with the industrial electrical development of Manchester.

As in the case of other industrial centres, the local problem during recent years has been to keep pace with the increasing requirements of power users, with this difference, that the Manchester problem has all along been on a magnified scale, which, needless to add, has become increasingly difficult during the last three years.

In 1913 the electricity undertaking exceeded the 100 million mark in output sold, and during the year ended March last, over 172 millions of Board of Trade units were disposed of, a total which might easily have been 200 millions had all anticipations been realised.

The Stuart Street generating station, which dates back some 17 years, marked the decision to generate three-phase E.H.T. energy in place of the L.T. direct-current which had previously sufficed for local requirements; this latter supply was given from the original Dickinson Street station, supplemented in 1901 by the adjacent Bloom Street Station.

The Stuart Street station was constructed in two parts, the earlier portion to the design of Sir (then Dr.) Alexander Kennedy, while the second portion was originated by Mr. G. F. Metzger, city electrical engineer at that time, and reciprocating plant in comparatively large units was installed by both these engineers.* With the advent of Mr. S. L. Pearce, the present city electrical engineer and manager, the installation of reciprocating plant was discontinued, he having decided for various reasons to install turbine plant in future. We must refer our readers to the various articles which have appeared in our pages for details of the extensions which have been carried out from time to time; it will be sufficient to say that under Mr. Pearce's direction the reciprocating plant was supplemented by three turbo-alternators of 6,000, 6,000, and 7,500[†] kw. capacity respectively, followed by a 15,000-kw. machine,§ which was the first really large turbine set to be installed in this country. In addition to these high-pressure turbines, a 4,500-kw. exhaust steam turbine|| and jet condensing plant was installed to operate on the exhausts from three of the six 2,500-H.P. Corliss engine sets which comprised the generating equipment of the first portion of Stuart Street station.

Contemporarily with these extensions, additions were made to the boiler and cooling tower installations, and prior to the outbreak of war it was agreed, in view of the limited condensing facilities and necessity of making adequate provision for coal storage, that some 60,000 kw. of installed plant capacity represented the economic limit of the Stuart Street site.

In view of this the Manchester authorities, on the advice of Mr. Pearce, decided to launch out a bold scheme for meeting the rapidly increasing electrical necessities of the area, and as a result, what would have been the first super-station in the Kingdom was planned, with a projected capacity of 160,000 kw.‡ A site was selected at Barton, about five miles from the centre of the city, all sanctions were obtained, and all preparations made for the actual construction of this station, but in view of the now well known difficulties as

regards industrial developments which arose as a result of the concentration of the country's resources on the war, it was found necessary to postpone the carrying out of this project, and to concentrate attention on the Stuart Street station, which policy offered the only means of meeting the urgent demands for power arising from the war. This policy involved the supersession of the then existing reciprocating plant by turbine plant, and when the scheme of reconstruction now being carried out is completed, only one 6,000-H.P. reciprocating engine set will remain in the station.

Since the outbreak of war, two 6,000-kw. turbo-alternators, one of Westinghouse-Siemens and the other of Westinghouse construction, each running at 3,000 R.P.M., and operating in conjunction with Mirreles-Watson jet condensers, have been installed in the place of two of the original 2,500-H.P. cross-compound vertical Corliss engine sets.

The 4,500-kw. Howden-Siemens exhaust steam turbine, which operated in conjunction with three other of the above engine units, has been reconstructed on high-pressure lines to use live steam, and this incidentally freed one half of the existing condensing plant for use with the additional turbines.

A second 15,000-kw. Richardson-Westgarth turbine coupled to a Westinghouse alternator, running at 1,500 R.P.M., is now being installed in place of one of the 6,000-H.P. (4,000-kw.) Wallsend-Electrical Co. sets; this is fitted with Richardson-Westgarth surface condensing plant.

There is also on order for delivery in the autumn of 1918 a 20,000-kw. turbo-alternator set, by the last-mentioned firm; it may be mentioned that both these large turbine sets are very conservatively rated, and would under Engineering Standards conditions be regarded as of 20,000 and 25,000 kw. maximum continuous rating respectively.

As previously mentioned, one of the difficulties of the Stuart Street site has always been water shortage; some of the condensing plant is, of course, jet condensing, the Manchester and Ashton-under-Lyne Canal furnishing the necessary water, but for the surface condensing plant, cooling towers and tank storage have been provided, and this latter installation will be greatly extended when the large contracts which have been entered into with the Klein and Davenport Companies for new natural and fan draught towers are completed.

The disproportionate increase in generating capacity as compared with floor area, due to the large increase in turbine plant, naturally involved certain reconstruction in the steam raising installation to meet the increased demand for steam.

Prior to the war, the boiler plant comprised 46 boilers—of the Babcock & Wilcox land and marine types—installed in two boiler houses; a third boiler-house has now been added, in which two Babcock and Wilcox marine type boilers, each of 60,000 lb. per hour evaporative capacity, have been installed. These boilers are self-contained units, one having straight induced draught and the other the Prat ejector draught plant, while both have chain-grate stokers; they were originally intended for the projected Barton station.

The first boiler house, constructed under the Kennedy scheme, is being modernised, and its equipment of 24, 12,000-lb.-per-hour Babcock & Wilcox boilers is to be swept away; two new 60,000 lb.-per-hour boiler units, similar to those in the third boiler house, will shortly be in use in this boiler house, and orders have been placed for four 100,000 lb.-per-hour Babcock & Wilcox marine type boilers as a further installation.

These are probably the largest capacity boilers so far contemplated in this country, and are to be single-ended and fitted with both forced and induced draught. Each will have 416 sq. ft. of grate area.

COAL STORAGE GROUND.

This is an Open Air System. Open Air System. Manufactured in Birmingham with Turbine Plant. No.

14,000 sq. ft. of heating surface, 7,500 sq. ft. of economiser surface, and 5,145 sq. ft. of superheater surface, and be constructed as a self-contained unit. Large boiler units are essential to secure the utmost development of the Stuart Street site, hence the drastic action in connection with the older plant.

To supply the increased coal requirements of the station, a third line of conveyors is being added in the first and second boiler houses, and in connection with these and other industrial developments in the neighbourhood, the coal railway facilities will be doubled, and in the result the cost of delivering fuel will be greatly reduced.

The large increase in plant capacity at Stuart Street has necessitated the remodelling of the E.H.T. switchgear, and large-capacity switches are being installed throughout, the bus-bars are being sectionalised with reactances, and a reactor house is being constructed to contain the latter.

In addition to this work, a turbine set is being installed in the Bloom Street station, to allow of which one of the four 1,800-kw. Musgrave-Westinghouse direct-current vertical Corliss engine sets has been removed.

The new plant is being supplied by the British Westinghouse Co., and will have a rating of 10,000 kw., speed of 1,500 R.P.M., and supply three-phase current into the E.H.T. system; its use will also enable the three remaining reciprocating sets to be shut down. It will further supply the local direct-current requirements for lighting and traction, through the converting plant, some 7,000 kw. of which is installed, in the adjoining Dickinson Street station, and be supplemented when necessary by the remaining direct-current generating plant in these stations.

As many of our readers are aware, the electrical development of the Manchester area has made rapid strides during the last 10 years, during which period its output has increased fourfold. Even with Stuart Street station remodelled, and containing between 90,000 kw. and 100,000 kw. of generating plant, and the additional plant at Bloom Street, the problem of meeting future requirements, by the construction of the Barton station, must still remain.

This problem has, however, been raised to a new plane since the wider aspects of electrical supply became emphasised, and we venture to prophesy that the rôle of the Barton power station, when it materialises, will be of a different character than was anticipated when the original proposal took shape. One need only point to the proposed establishment for manufacturing nitric acid from the air, which may ultimately require some 15,000 kw., the carbide factory which is being built and will take some 10,000 kw., and to the growing list of factories, including electric furnace and electric rolling mill equipments, to indicate that the future large scale requirements of this area are by no means visionary.

In conclusion, our thanks are due to Mr. S. L. Pearce, the chief engineer and manager of the Manchester electricity undertaking, for enabling us to briefly indicate the trend of events in the department under his control.

ELECTRIC VEHICLE NOTES.

THE industrial possibilities of the electric truck and tractor in this country offer an exceedingly wide field for speculation; so far we have touched the fringe of the development in sight, and the as-yet unconsidered possibilities of this form of transport represent probably an equally large field of usefulness.

Apart altogether from private and municipal users of the industrial electric, probably the most hopeful sign of future progress is in the extensive purchases of these vehicles by great railway companies, whose interest in a new proposition is anything but experimental in character. If the railway companies prove to their own satisfaction that the movement of freight from their yards and warehouses can be more economically dealt with by electric than other types of vehicle, the time will not be far distant when our dock and harbour authorities, and the carrying companies connected with them, will begin to hold similar views.

Railway and dock premises in large cities are always costly matters, and a portion of this cost can, of course, be debited to the horse when making comparisons, inasmuch as goods yards, loading docks, and the sheds, which often cover the latter, have to be made proportionately larger to allow for the increased standing and manœuvring space required by the horse-drawn vehicles as compared with that needed by electric vehicles.

The handiness and adaptability of the "electric," and the ease with which it can be manœuvred, are of supreme importance where rapid handling of deliveries is essential, added to which is its freedom from fire risk, which often makes it the only type of motor vehicle which can be admitted into warehouses where combustibles are stored. The horse vehicle is a luxury in the case of a large transport organisation, and one for which not only does it pay, but the surrounding community also, through congestion of traffic in the streets, loss of time, &c.

A typical example of what may come in this country is shown by the practice of the Brush Terminal Co., of New York, whose premises cover some 200 acres along a mile of water front, and include eight piers to accommodate ocean shipping, a railway yard with 23 miles of track and 123 warehouses. In addition, a large cold storage installation is provided, and an unusual departure is the provision of 16 industrial buildings, in which space is available for manufacturing, at attractive rentals.

The feature of the terminal is the use of electrically-operated appliances throughout; the railway cars are shunted by electric locomotives, of which there are three 40-ton and one 60-ton trolley-type G.E.C. machines. What transportation is required between piers and railways and warehouses is handled by electric tractors, battery trucks, battery cranes, motor-driven hoists, elevators and motor-driven piling machines, while delivery and collection of freight outside the terminal are handled by electric trucks.

Shipments received by water may go direct to freight cars, or to lighters, or to trucks delivering in the city, or to warehouses or factories; similar possibilities are open to goods received by rail.

To supplement the ships' winches, portable electric hoists are provided on the piers; goods are unloaded into trucks, four or five of which are drawn by battery tractor to the warehouse, and as 12 trucks are provided to each tractor, sufficient are available for continuous loading and unloading at each end of the route, while the tractor can be kept always on the move. Where packages weigh 1,000 lb. or more, crane tractors are employed, which not only haul, but load and unload when required. Sixty portable electric hoists are employed for lifting freight into warehouses, &c., where also the electric piling machines are used for stowing.

With the older method of handling mixed freight, something like 50 per cent. of the operating cost was eaten up by inefficiencies, delays, wastes, excessive labour costs, &c.; this is eliminated by the electro-mechanical methods now in use.

For city deliveries the electric vehicles are loaded at night, for delivery early in the morning; the batteries are

Platinum.—A Reuter's correspondent at New York states that the discovery of platinum in Alaska has aroused Government agencies to the greatest activity in the hope of finding sufficient quantities of this metal to meet the war needs of the Allies. Four Government experts have been assigned to study the Alaskan situation and report if the discoveries may replenish the platinum supply cut off recently by the virtual cessation of activities in the Ural Mountain mines, the source of the world's greatest supply. So acute is the world shortage of platinum that the metal has advanced from \$45 to \$105 an ounce since the beginning of the war.

charged at night, and receive a boosting charge during the day.

The *Electrical World* says that the data thus far available shows that the tractors have performed their duties with a current consumption of 331 ampere-hours per ton-mile. The average weight transported has been 123 tons, and the length of haul between 100 ft. and 6,000 ft., or an average of 0.4 mile. Four-wheel platform trucks, 14 ft. long by 4.5 ft. wide, and equipped with roller bearings, are employed in this service. Among the various forms in which the miscellaneous warehouse commodities are handled in the raw state are bales, bags, cases, barrels, mats, &c. Of the 1,325,000 tons of freight handled at the Bush terminal per year, about 324,000 tons is moved by tractors between the piers and warehouses. The remainder is transported in trucks or trains handled by electric locomotives.

Several typical examples will serve to show the relative advantage of handling material by electric tractors instead of by hand or with horse trucks. For instance, in loading trailers with bales of fibre, the battery cranes and tractors can perform the work at a cost of 7.2 cents per bale, whereas with hand operation it costs 8.8 cents per bale; 300 lb. bags of ore can be loaded on to cars by battery cranes at a cost of 21 cents per ton, whereas with hand operation it costs 32.4 cents per ton. In addition, the battery crane permits an average increase in speed of handling of about 40 per cent. Comparing the use of horse trucks and tractors for loading and unloading ease goods and transporting them, it costs 16.1 cents per case with horse truck and 14.2 cents per case with tractors. The last two values are based on hauling the commodity 450 ft.

Storage battery tractors show an advantage also when the cost of operating them is compared with that of moving commodities in box cars. For instance, suppose that 400-lb. bales are to be moved from a lighter to a pile in the storehouse: the complete cost of operation with a battery tractor is 8.7 cents per bale, whereas when moving the material in the box cars the cost is 26.2 cents per bale. At the Bush terminal the cost of energy for loading, unloading, and transporting materials amounts to a small percentage of the total operating cost per year. Labour expenses represent 41.7 per cent. of the total operating cost. The yearly operating cost of the tractors is 66.3 per cent. of their initial cost.

The performance noted in the preceding data is rather remarkable, in view of the fact that some of the batteries are operated at 75 per cent. overload, and are unprotected from the excessive jar and vibration due to the trucks and tractors operating over the rough cobble stones and boards between the piers and warehouses. Edison batteries are used in the trucks and tractors.

The company has recently ordered 20 more 5-ton tractors.

The energy used at this terminal for freight handling, light, and power is furnished by the Brooklyn Edison Co., and averages 12 million KW.-hours a year.

The relatively high operating efficiency of electrical, as compared with other apparatus, suggests the general assumption that the energy used per ton handled—in the case of the Bush terminal, roughly 9 KW.-hours per ton—is a direct measure of the operating efficiency of the terminal organisation: especially would this be so under dear labour conditions.

The enclosed non-tidal British dock estates would probably account for a good deal more power than the river piers of the Bush terminal, especially where there are grain silos and heavy pumping requirements, and if we take the 1913 shipping tonnage figures for British ports (exclusive of coastal tonnage) as an approximate indication of the possible electrical requirements during a normal year of certain British ports, using as an overall basis figure 10 KW.-hours per ton handled, instead of the 9 KW.-hours used by the Bush Co., we obtain some startling figures, viz.:—Liverpool, 150 million KW.-hours; London, 200 million KW.-hours; Southampton, 120 million KW.-hours per annum, &c.

These ports handle general merchandise, grain, &c., and are, therefore, to some extent comparable with the Bush terminal, though as their planning often dates back a good many years, even the most efficient reorganisation of method could probably involve a higher average use of energy than the American figure quoted. It is, of course, fully admitted that electrical methods are very largely employed in railway and dock terminals in this country, but the electric truck, tractor and vehicle are usually conspicuous by their absence, and the really intensive electrical methods employed by the Bush and other American concerns are unknown here.

COSTS IN ELECTRIC FURNACE OPERATION.

AN interesting study of the relation of the costs of electrodes, refractories, electricity, labour, and raw materials, to total expense in electric furnace operation, particularly with reference to single electrode furnaces, was recently contributed to our contemporary, the *Electrical Review* of Chicago, by Mr. F. T. Snyder.

The author points out that there are six items of expense in electric furnace operation, viz.:—(1) Cost of electrodes, (2) cost of refractories, (3) cost of electricity, (4) cost of labour, (5) maintenance, depreciation, and investment charges, and (6) cost of raw materials.

The last item is practically unaffected by type of furnace or form of current supply, and need not be further considered.

Electrode Cost.—The electrode costs the user in two ways—viz., by the burning away of the electrode and by the heat which it conducts out of the furnace. The sum of these items constitutes a charge per hour of furnace operation, and for a well-designed furnace melting 1,000 tons of steel a month represents some \$5,000 (£1,200) a year per electrode.

It is evident that a reduction of the number of electrodes warrants serious consideration: with capital worth 20 per cent. a year the elimination of one electrode would justify an investment of \$30,000 (£6,000). The ideal furnace would have no electrodes, and the induction furnace met this requirement, but unfortunately introduced defects which rendered it commercially impracticable. By using the metal bath in the furnace as one terminal of the arc, a furnace can be operated with one electrode per arc.

As three-quarters of the cost per year of each electrode is due to surface burning, the smaller the electrode the lower will be the electrode cost. The size of the electrode is determined by the current, and this (and the size) will be smaller, the higher the voltage between electrode and bath. The voltage is limited by a roof condition; silica bricks used for roofs are fairly good electrical conductors at white heat, and at steel finishing temperatures the furnace gases are rather good conductors. When current is switched on the arc will jump a considerable distance, which limits the pressure between a single electrode and the bath to about 220 volts.

If two or more electrodes are used through the same roof, experience shows a limit of 110 volts between electrodes to avoid breakdown roof leakages; that is for two electrodes, 55 volts between each electrode and bath. With the same energy input each of the two electrodes has, therefore, to have double the cross section of the single electrode with the higher voltage, or a combined cross section four times as great, and therefore four times the heat losses of an equivalent single electrode, and three times the sum of heat losses of the single electrode and a contact to the bath. The burning surface of the two electrodes is double that of a single one, and the equivalent cost of two electrodes with two arcs in series, on the basis of 1,000 tons of steel a month is \$13,500 (£2,700) a year, as compared with \$7,500 (£1,500) for one electrode and its contact.

If three electrodes are used through the same roof, so as to introduce directly three-phase current into the furnace, the limiting

SINGLE-PHASE DOORLESS ELECTRIC FURNACE.

voltage is usually kept at about 110, and this results in a potential of about 65 volts between electrode and bath. With the same total input each electrode will carry one-third of the energy of a single electrode at about one-third of the voltage, and therefore each electrode will carry the same current as does the single electrode, and be the same size, the three having heat loss and surface burning equal to three times those of a single electrode.

Thus for 1,000 tons of steel per month, the electrode cost for the three electrodes will be \$18,000 (£3,600), as against \$7,500 (£1,500) for a single electrode and contact.

Refractories Cost.—It is the common knowledge of electric steel operation that the bulk of the refractory cost is due to roof wear, and that the roof wears most around each electrode—in other words, it is substantially proportional to the number of electrodes. The cost figures from different furnaces show a total refractory cost

for three-electrode furnaces of substantially three times the total refractory cost for single-electrode furnaces. With a well designed furnace melting 1,000 tons of steel a month, this refractory cost may be kept down to \$4,000 (£800) per electrode per year.

It is the maximum temperature at the end of the heat that wears the refractories in a steel furnace. As the roof walls and slag are near the same temperature, they are radiated to each about the same. Part of this energy is absorbed by and passes through the roof and wall. In a well designed furnace this amounts to less than 10 per cent. of the total power input. Of the energy radiated by an arc, about one-half goes directly to the slag; the

of the roof bricks can be improved by water cooling, but the heat lost to the water is greater than the heat saved by increased energy input.

Increasing the energy input does not necessarily result in higher furnace temperatures; the latter are determined by the melting point of the metal, and cannot rise above the melting point of steel, so long as there is unmelted metal in the furnace. With a single electrode furnace no limit has been found to the rate at which power can be put into a furnace and the efficiency correspondingly raised if certain simple metallurgical precautions are taken. If energy is put in faster than the steel can be "killed" (freed of

oxygen), after the steel is melted, the excess only operates to raise the temperature and melt the walls. To permit a high rate of energy input the elimination of oxygen must be speeded up; air leaks through furnace doors prevent this; the air burns up the electrode, oxidises the steel, and carries away heat in escaping. The value of the heat loss for each door of the sliding type has been determined at some \$1,500 (£300) a year. Two ordinary doors may easily double the time required to finish a heat.

As it is in practice almost impossible to keep a door tight, the difficulty can be overcome by having a doorless furnace, with a tilting roof to admit the charge. A simple self-sealing joint was made by putting a narrow ring of sand on the top of the furnace wall. Any piece of scrap that the furnace will hold can be put in through the roof, while the scrap has to be cut to enter a door. The heat loss in opening up a roof is found to be much less than through a single door. The steel can be deoxidised as it is melting, and, when melted, can be poured, reducing the time taken.

Labour Cost. The open roof furnace enables charging to be done with a dump bucket and crane, and such a furnace can be operated by one melter and a helper, or, if of less output than 500 tons a month, without a helper.

A single high-voltage electrode is lighter to handle, and requires less time for adjusting than three electrodes; high voltage has another advantage, as with a single electrode are about 185 volts available for arc length, which gives an arc about 5 in. long, and the rising of a slag bubble $\frac{3}{4}$ in. reduces the arc resistance less than 20 per cent., whereas the 30 volts available in a 65-volt three-electrode arc only allows of $\frac{3}{4}$ in. arc length, so that each time a slag bubble comes up under an electrode, the power load is short-circuited in the arc.

For this reason the boiling of the bath does not take any of the melter's time with a single-electrode furnace, but takes all the time of one man with a three-electrode furnace. To overcome this difficulty

SIX-TON, THREE-PHASE FURNACE, WITH THURY REGULATOR.

other half is reflected by the roof and walls. The roof and walls are therefore at a temperature between the temperatures of the slag and the arc.

The energy to be radiated per sq. in. of arc surface determines the temperature to which the arc must rise to get rid of energy at the input rate. If the arc is twice as long, and remains the same diameter, it will have twice the surface and radiate twice the energy at the same temperature, or will radiate the same amount of energy at a lower temperature. The three-electrode arc voltage is 65; the single-electrode arc voltage is 220; and in each case about 35 volts are absorbed by the arc terminals. This leaves 30 volts per arc to determine the length of each of the three arcs of the three-electrode furnace and 185 volts for the single arc of a one-electrode furnace. Therefore, the total length of the single arc is more than twice the sum of the lengths of the three arcs. As this single arc has consequently to radiate only half the energy per sq. in., it will be cooler than each of the three arcs, as it does not have to back up so far to radiate its energy, and the walls from which its heat is reflected will be cooler also. While the reduction in temperature of the long, high-voltage arc does not amount to a great many degrees, the reduction in temperature comes near the melting point of the silica brick of the roof, and makes a large actual increase in the number of heats that the roof will last.

Electricity Cost.—The molten metal poured into the ladle, the hot slag, and the gases given off during melting, contain a definite amount of energy, approximating 350 kw.-hours per 2,000 lb. of steel. There are also direct losses by radiation through the furnace shell and the heat loss through the electrodes, which go on continuously after the furnace is heated up, and would represent about 120 kw. continuously in a furnace producing 1,000 tons of steel per month. If the furnace input were 210 kw.-hours, only 120 kw.-hours would be available for steel melting, at which rate it would take about three hours per ton melted, and 360 kw.-hours of heat energy would be lost, making a total energy consumption of 360 plus 350 or 710 kw.-hours per ton of steel.

If the furnace were given an energy input of 820 kw., the net energy available for melting, after losses were supplied, would be 700 kw., which would melt the ton of steel in half an hour, during which time the heat losses would only be 60 kw.-hours, so that the total energy for melting would be 410 kw.-hours per ton.

It is evident that the higher the energy input the higher will be the heat efficiency. With a three-electrode furnace the limit is soon reached, owing to lack of room to space the electrodes far enough apart to prevent current leakage through the roof. The insulation

SIX-TON ELECTRIC ARC FURNACE.

three-electrode furnaces are provided with automatic regulators, which, however, have yet to demonstrate their value as labour-savers.

A doorless single-electrode furnace only uses $\frac{1}{2}$ the weight of the electrode per ton of product used by a three-electrode door-type furnace, and this represents a substantial saving in labour in handling; the roof with one electrode hole also lasts longer, and these items, summarised, mean that some \$4,000 (£800) per year will be saved in labour cost in producing 1,000 tons of steel a month in a single-electrode doorless furnace.

Maintenance, Depreciation, and Interest Charges.—The three-electrode equipment is obviously more costly in maintenance and depreciation than the single-electrode equipment, especially if automatic regulators are employed with the former. As the single-electrode furnace can be operated at double the speed of the other, the original investment and interest on first cost are also less. With 1,000 tons output per month, the difference due to these items will reach \$6,000 (£1,200) per year. Summing up the various items in favour of the single-electrode furnace for the output assumed, the total saving will reach \$36,500 (£7,300) a year. As a well-designed furnace requires an energy input of about 800 kW. for an output of 1,000 tons of steel per month, this saving equals \$45 (£9) per year per kW., and this is a good return on the investment required to change the standard three-phase current distributed into either single-phase or direct current suitable for use in a one-electrode furnace.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The City Guilds' Lists of "Works of Reference."

We should like to be permitted to place it on record that success has at length crowned the repeated, and almost single-handed, efforts of Mr. Sidney Rentell, A.M.I.E.E. (editor of your contemporary *Electricity*), to bring about an improvement in the lists of Works of Reference relating to the electrical subjects.

For more years than would be believed, these lists (which are published in the Institute's Annual "Programme") have been in a state of suspended animation: excepting that for "Electrical Installation (late wiremen's) Work," which is of recent growth.

The waking-up of the City Guilds' authorities to the absurdity of recommending out-of-date and out-of-print books, and not including new ones, year after year, is, without doubt, mainly due to Mr. Rentell; and he has done a great service to students, to teachers, to authors, and to readers generally.

How has he done this good work? By repeatedly reprinting the lists, and showing what books were out of print, and, in some cases, for how long; by opening his columns to letters and articles of protest; and by a certain very direct method which, apparently, did not fail to have final effect.

No longer (or we had better say, not for some time) will the teacher, student, or other person interested in electrical engineering books be confronted with a list starting with a book that has been out of print for a quarter of a century; and including about 10 others that ceased to exist a varying number of years ago.

No longer will people run the risk of having an order for a book returned with the doubly-irritating information that the work is out of print, and that the publisher retired from business when he (the orderer) was a boy at school.

Some 17 books have been thrown out of the Electrical Engineering List, and about 30 new ones have been added. The value of the list is increased by dividing the 60 (or so) works into classes, but is considerably diminished again by omitting to give the publisher's name in nearly a score of cases.

We will not venture to criticise the new works of reference selected, but we notice that Mr. William Cramp is credited with "Continuous-Current Design," and that Mr. Aspinall Parr has become Aspinall & Parr.

The lists for "Telegraphy and Telephony" and for "Electro-Metallurgy" have not been subjected to such an extensive overhaul.

A. P. Lundberg & Sons.

Islington, August 29th, 1917.

Fault Localisation.

I have read with interest the articles on fault localisation by Mr. H. E. Blake and others in recent issues of the REVIEW. These articles show some ingenious methods of locating faults and overcoming all difficulties but the one which, in my experience, occurs most frequently—*i.e.*, the reduction in cross section of the copper conductor at the fault due to arcing or corrosion.

An instance of such corrosion is mentioned by Mr. D. M. W. Hutchison in his article on "V.B. Cable Breakdowns in the Tropics," and I have found this reduction in cross section in nearly all cases of faults on L.T. cables.

A sketch of a cable corroded or burnt is given in fig. 1, and it will be seen that the actual point at which the current leaves the faulty conductor may be at A, B, or C, or anywhere else on the corroded portion, a similar effect being produced by a loose ferrule due to the melting out of the solder when the fault occurs in a joint box.

The problem then is to find the fault under the conditions as drawn in fig. 2, where A, B, C, or D represent the unknown resistances of the corroded or burnt portion of the conductor at the fault, and r represents the fault resistance, which can be eliminated by use of a bridge method of testing.

If the resistances A, B, C, D are neglected, the probable result is that one is entirely misled as to the position of the fault particularly as the portion of the conductor between A and C, in fig. 1, may consist of carbonised insulation or globules of copper, iron, and lead, the resistance of which for a 1-in. length may be equal to some hundred yards of the copper conductor.

The induction method is of very little value as a check when lead-covered or armoured cables are concerned, as one may easily be led streets away by the pranks of the leakage current, which has been known on several occasions to affect a search coil strongly in a street where no cables were laid, the gas pipes providing an easy path back to the station earth-plate.

In the case of a short circuit between lead-covered single cables, the induction method may be used by means of a rectangular search coil laid over the cables, with its long sides parallel to the

FIG. 1.

FIG. 2.

faulty cable; if there is an earth on as well as a short circuit it will be necessary to use an unearthed source of current for testing.

In the case of V.B. single cables the induction method is of great assistance in finding out earths or short circuits, the only difficulties being the presence of adjacent water or gas pipes, along which the leakage current tends to flow, and the fact that faults are often of high resistance, due to the self-sealing character of the insulation.

These high-resistance faults only allow a small testing current to be passed, but this can be made much more effective by connecting a condenser across the contacts at which the current is interrupted when D.C. is used.

I have also experimented with detectors used in wireless telegraphy, the fault being used as a spark gap fed from an induction coil, Hertzian waves being generated and used to affect the detector; this method may prove to be of assistance in finding open circuits, but one cannot now experiment owing to the restriction due to the war.

In conclusion, while the bridge and other methods of fault finding are useful, it is very gratifying when using those methods to be informed of a "hot flag" somewhere over the faulty cable.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

The Vislock Lock Nut.

The necessity of preventing nuts from slacking-off when once screwed up has long been recognised by engineers, and very many devices have been employed from time to time with a view to securing that result.

In recent years the extending use of mechanical road vehicles under conditions in which excessive vibration is necessarily present, has brought the matter into greater prominence, and as in the future adequate locking for nuts will probably be an

FIG. 1.—SECTIONAL VIEW OF THE VISLOCK NUT.

indispensable feature of machine design, especially where, as for instance, in certain classes of electrical machinery, there is a natural tendency to slacking-off through vibration, some interest attaches to the subject.

Of the various devices which have been introduced, probably the Vislock lock-nut is as well known as any; it is simple and self-contained, and indistinguishable in appearance from the ordinary lock-nut arrangement which has been the standard—though frequently ineffectual—practice for many years.

The makers of the Vislock nut have now had four years' experience with their products in daily use on a very extensive scale, which leaves little room for doubt as to the effectiveness of the device, which, our readers may remember, consists of two nuts, which are mechanically connected by an internal shank extending below the upper nut into a specially-shaped recess in the lower one.

and depends for its utility on the wedging action produced between the bolt and nut threads in this recessed portion, when the upper nut is rotated relatively to the lower one.

The Vislock nuts are made by VISLOCK, LTD., of 3, St. Bride's House, Salisbury Square, E.C., in British Standard Whitworth sizes from $\frac{1}{4}$ in. to 2 in. diameter, the bigger sizes ($1\frac{1}{4}$ in. to 2 in.) being specially made for heavy machinery; they are also made in B.S. fine-thread sizes from $\frac{1}{16}$ in. to $1\frac{1}{4}$ in. diameter; two depths are supplied, 1 and $1\frac{1}{2}$ times B.S.W. and B.S.F. standard.

New Armature Winding.

MR. PHILIP C. JONES, of 111, Woodstock Road, Belfast, sends us the following description of a new method of winding armatures, for which a patent has been applied for:

Fig. 2 shows the coils all assembled on the core, and it will be noticed that the stampings are built so that the slots run in an arc of a circle.

The coils are wound on a circular former made in two halves, and of simple construction. One side of the coil is fitted into the

FIG. 2.—ASSEMBLING ARMATURE COILS.

slot, and requires no more forming, on account of the shape of the slot; a glance shows how insulation from core and between layers is effected.

The removing of a damaged coil without damaging others, and the making of the coils, are reduced in this winding to simple matters. The time required for winding the complete armature is greatly reduced, and a saving of copper is made through so little wire not being under the poles.

In the case of an armature of 6 in. diameter, with winding slots $\frac{3}{4}$ in. deep, with an ordinary winding $\frac{3}{4}$ in., would be required for bottom and top layers, but with the new winding $\frac{3}{4}$ in. slot depth only is required, the other side of coil being spread evenly over the periphery, thus reducing depth of winding from poles to $\frac{1}{8}$ in., with consequent advantages.

Fig. 3 is a view of a complete winding, showing the symmetrical appearance of armature. The winding is primarily intended for the smaller armatures.

Improved Method of Time Checking.

It is surprising how many employers there are who have up to the present failed to realise the great advantages to be gained by installing some system of departmental time checking for their workpeople, and it is still quite common to find large works where the employees deposit their time check when passing through one or more of the entrance offices, leading into the works, after which checking probably five minutes is lost by a fair proportion of them in reaching the particular part of the works where their employment lies. In these works it is to be noticed that the workpeople generally do not start actual work until the last of the "stragglers" has arrived. Firms who have installed departmental checking will substantiate the fact that all their workpeople being in their respective places when the works buzzer sounds, automatically start work almost directly. To meet the needs of works where a simple means is required of recording the actual presence of the employees in their respective departments at the allotted times at the various periods of the day, a system has been invented and patented by a large engineering firm in the Midlands, and whilst this was primarily designed to meet their own needs, the apparatus has proved so low in first cost, absolutely reliable in use, foolproof, and infallible in action, that it has been decided to manufacture the whole outfit and place it upon the market.

In this system a cabinet is placed in each department. On the front of the cabinet is an indicator showing for which time the checking is at the moment operating, a slot into which the workman places his check, and a metal scoop into which the check is returned to the workman should it be placed in the cabinet "after time." All the cabinets are simultaneously electrically controlled from one central point, the actual control being operated either from a clock or by the works time-keeper.

In the particular works for which this system was designed, the cabinets are opened at 5.45 each morning, and remain open until

6.5 a.m., the indicator during this period showing "Early." At 6.5 a.m. one of the electrical circuits being momentarily connected up the indicator then shows "6.30," and all checks are diverted into another part of the cabinet. At 6.30 a second electrical connection is made, after which the indicator shows blank, and checks dropped through the slot are returned to the workman through the front of the cabinet, the man having tangible proof that he is "too late."

The breakfast time being 8 a.m. to 8.30, the cabinet remains closed till 8.15, when the above process is repeated, and the cabinet remains open till 8.30. At dinner time, 12.30 to 1.30, the cabinets are opened at 1.15 and closed at 1.30.

The checks actually drop into a "transit" box, placed and locked inside the cabinet. This box has two compartments to receive the "early" and 6.30 checks, as it remains in the cabinet until the same is closed at the latter time. The transit box has a spring lock lid, and is made in such a manner that it is impossible to take it out of the cabinet without the lid being closed and locked. There is therefore no possibility of checks being inserted whilst the boxes are in transit between the cabinets and time office, where the boxes are

FIG. 3.—FINISHED ARMATURE WINDING.

emptied and the check numbers entered up on to the daily time sheets for payment. The system is adaptable for almost any conditions of working hours, as there are three distinct "times" or "blanks" available. The electricity consumption is negligible,

FIG. 4.—TIME-CHECKING CABINET, WITH SPARE TRANSIT BOX.

FIG. 5.—CONTROL PANEL FOR OPERATING CABINETS.

amounting to only a few pence in the whole year, as the current is only on momentarily at each operation. Further particulars may be obtained from Mr. G. E. Allin, 21, Dairy House Road, Derby.

SCIENTIFIC AND INDUSTRIAL RESEARCH.

THE following is an abstract of the report of the COMMITTEE OF THE PRIVY COUNCIL FOR SCIENTIFIC AND INDUSTRIAL RESEARCH, for the year 1916-17 (Cd. 8,718; price 3d. net):—

Since we last reported, Lord Crewe and Mr. Henderson have been added to our Committee under supplementary Orders in Council.

On December 1st last Lord Crewe, the Lord President of the Council, announced that the work of the Committee of Council for Scientific and Industrial Research had been established as a separate department, with offices in Great George Street. As the work of the Advisory Council developed and the industrial side of research grew in bulk and importance, it became clear that a separate organisation, having its own estimates, in charge of a minister responsible to Parliament, was a necessity. The foundation of the new department led to the creation of the Imperial Trust for the Encouragement of Scientific and Industrial Research. A donation of £1,000 made by Messrs. R. H. & R. Williamson, to be expended as to half its amount on research into some subject of mechanical engineering in conjunction with the Institution of Mechanical Engineers, and as to the other half on such research as the Committee of Council may determine, has been deposited with the Trust. It is also intended that the Trust shall hold on behalf of the Department the sum of one million sterling which Parliament has voted for the purposes of the Department, to be spent over a period of five or six years. Our Advisory Council have recommended that the money thus made available should be spent in the form of grants in aid of research undertaken by firms in any industry which may combine to conduct it on a co-operative basis. The best means to this end is the establishment under the Companies' Acts of associations for research limited by guarantee and trading without profit. The Board of Inland Revenue have decided that no objection shall be offered by their surveyor of taxes to the admission, as a working expense for income-tax allowance, of contributions by traders to industrial associations under Government supervision which may be formed for the sole purpose of scientific research for the benefit of the various trades, or specifically earmarked for the sole purpose of the research section of an adapted existing association.

During the past year we have concluded negotiations with the Royal Society for the transfer of the property of the National Physical Laboratory, together with the responsibility for its maintenance and development, to this Department. The scientific management of the laboratory will remain in the hands of the Executive Committee under the chairmanship of Lord Rayleigh, a member of our Advisory Council.

In order to deal effectively and systematically with the urgent problem of fuel economy, we have appointed a Fuel Research Board, with Sir George Beilby as Director, without remuneration. The other members of the Board, who are also unpaid in this capacity, are:—The Hon. Sir Charles A. Parsons, K.C.B., F.R.S.; Sir Richard Redmayne, K.C.B.; Mr. R. Threlfall, F.R.S. The Board will report to us through our Advisory Council, but it is our intention that it shall have executive powers within the limits of an annual budget approved by us. The Fuel Research Board has recently appointed an Irish Committee of Inquiry into peat as a source of power. The Committee will meet in Dublin under the chairmanship of Sir John Griffith.

We have considered and approved recommendations in respect of aid to 44 scientific investigations of industrial importance. We reported last year that we had approved grants to a number of individual students and research workers for the year 1916-17 to an amount not exceeding £6,000. In the event we have not expended more than £3,550 odd under this head upon 36 workers. Throughout our work has suffered in amount owing to the war, and we were unable to expend more than £14,521 out of the £40,000 placed at our disposal by Parliament for the financial year 1916-17. During the current year we have taken a sum of £38,050 in our estimates in addition to the fund of a million referred to above. The annual vote is intended to cover (a) the cost of those researches which will not be undertaken by the proposed research associations; (b) the grants to individual research workers, both students and others; and (c) the cost of administration.

REPORT OF THE ADVISORY COUNCIL.

In our report of last year we discussed the vital need of research at the universities, especially in pure science, and expressed our belief in co-operation between capital, management, science, and labour as the best means of financing and directing the extended laboratory investigations, and the large-scale experimentation required for industrial research.

The experience of another year of work has confirmed our first estimate of the position. We have made progress. But the progress must be slow, for the calls of war continually grow, and the numbers available for other work, however important, continually shrink.

We have addressed ourselves during this year in the main to the organisation of industrial research, first, because we felt the paramount importance of arousing and securing the interest of manufacturers in the application of science to

industry, and, secondly, because the influence of the war has created in industry an atmosphere conducive to the growth of new ideas, whereas it has unfortunately made the prosecution of work in pure science and in its organisation a matter of extreme difficulty.

Organisation.—The one question of policy, to which throughout the year we have continuously devoted our attention, is the working out, with all the care and advice we have been able to command, of the policy of co-operative industrial research foreshadowed in our last report. Association and combination are "in the air," and many trade associations have come into existence during the past year, some of which include research among their objects. The intention of the Government is to make a contribution to the assured income of such associations from the subscriptions of their members, varying in amount according to circumstances, and with a normal maximum of pound for pound, though in very exceptional cases this limit may be exceeded.

We proceeded to draft a model Memorandum of Association for companies limited by guarantee of nominal amount and working without profit, such as would fulfil the purposes we had in view, and at the same time be registered by the Board of Trade under the Companies' Acts without the use of the word "limited." We have also prepared notes for the guidance of those desiring to draft the articles of an association for research, and a short statement of the conditions under which the Department would make grants to such an association when founded. Further, the Department has issued a brief descriptive leaflet on "The Government Scheme for Industrial Research," which explains in non-technical language the manner in which the associations are expected to work.

As regards the constitution of the governing body or council of an association for research, it is obvious that capital, management, and science must have suitable representation. But we believe, further, that greater success and a wider scope of action will be attained if provision is made also for the inclusion of labour. In most cases only skilled labour will be concerned; The interim report just issued by the Sub-Committee of the Reconstruction Committee on Relations between Employers and Employed advocates the establishment of standing joint industrial councils. We believe that councils so constituted as to be able to discuss with knowledge questions affecting both employes and employer would, if they could be brought to work successfully, greatly help the formation and development of trade research associations.

Substantial progress has already been made towards the establishment of a National Research Association by the great staple industry of cotton. The woollen and worsted manufacturers of Great Britain have appointed a provisional committee to draft the constitution for a research association. The Irish flax spinners and weavers have decided to take the same steps. The Scottish shale oil industry and the photographic manufacturers have decided to establish associations immediately, the electrical engineering firms and the British Society of Aircraft Constructors, in conjunction with the Aeronautical Society, have the matter under consideration, the Scottish shipbuilding and steel industries are moving, and it may be possible to establish an association for research into the non-ferrous alloys in the near future. The British iron puddlers and the Diesel engine manufacturers have independently established research organisations for the benefit of their respective industries. The coal mining industry is interested, but it will necessarily take time to organise this huge industry on a national basis.

There will remain, however, important fields for industrial research which we can never hope to cover by means of research associations. Research into fuel is one of these. The Committee of Council have accordingly established the Fuel Research Board as a part of the Department. The researches we are conducting through the British Fire Prevention Committee and the Concrete Institute respectively into the fire-resisting and other properties of different kinds of concrete, are also cases which call for national action. The same considerations hold good for the scientific problems underlying illuminating engineering and cold storage.

By far the most fundamental work initiated during the year, so far as the industrial aspect of our labours is concerned, has been the appointment by the Committee of Council on our recommendation, of a Director of Fuel Research, with a Fuel Research Board to assist him in laying his plans.

The services of Prof. Bone, F.R.S., of the Imperial College, were retained, with the consent of the College Governors, as consultant to the Board. The British Association Committee on Fuel Economy is prepared to place the valuable information it has collected at the disposal of the Fuel Research Board, and the Director may anticipate the active help of its members either in their individual or corporate capacity as occasion may arise.

The Fuel Research Board have already presented their first report outlining their proposals for taking stock of the coal resources of each district, classifying according to their qualities the seams which are being worked or which might, in certain circumstances, be worked, and ascertaining broadly the industrial uses to which the different kinds of coal are being put. It is intended, with the help of the coalowners, to collect typical specimens of the coal seams of the various coal mining districts, and to examine and classify them by means of chemical and physical examination in the laboratory. On

the more theoretical side it is intended to conduct investigations into the nature and origin of the various types of coal, and into the chemical and physical behaviour of their constituents under the action of heat and other agents, beginning with the well-defined types of coal as they occur in commerce.

The work of the Fuel Research Board, like that of the Provisional Committee on Research into Cotton has been in the main preparatory. Neither body has yet done much in actual research, for they have been doing the careful thinking without which ideas are barren.

We have, however, recommended that grants should be made for three pieces of research which are related to the work of the Fuel Research Board. The first of these is being carried on at the Manchester Municipal School of Technology, and has for its objects the use of better methods of domestic heating, and improvement in the ventilation of dwelling rooms. A grant has also been given to the Institution of Heating and Ventilating Engineers to enable them (a) to tabulate and print the result of five researches on domestic heating carried out at University College, London, during the past three years, (b) to carry out a research with a view to establishing coefficients of heat transmission through standard building materials, and (c) to conduct an investigation on heat transmission from radiators.

The third grant will secure the continuance of the work begun in 1912 by the Committee for the Investigation of Atmospheric Pollution.

A grant made in November last to the Institution of Mining Engineers to enable them to investigate (a) the influence of hot and moist atmosphere on workers employed in mines, and (b) the methods to be employed for cooling and drying the atmosphere of mines, will lead, we hope, to an improvement in the circumstances in which a large number of miners work. Since the grant was made the principal coalowners have been considering the establishment of a National Association for Research, which could undertake this and other researches affecting the industry.

The Ministry of Munitions and the firms concerned have co-operated with the Department in a series of experiments intended to remove the difficulties experienced by English manufacturers of X-ray bulbs. We have retained Dr. Willocks, of the Sir John Cass Technical Institute, to direct the investigations. Certain results of value have already been obtained.

(To be concluded.)

WAR ITEMS.

When the Nights Draw In.—A correspondent with the Forces in France, writing under date August 23rd, says:—"Until I came out here, five months ago, I had not missed an issue of the REVIEW for years. We do not get very much time for reading, but now that the nights are drawing in we shall probably find the time hanging rather heavily, and a perusal of the REVIEW will be profitable and keep us abreast of the times. I am afraid we shall not be able to reply to any of the 'Situations Vacant,' however. I dare say you would be very amused if you knew of some of the jobs that we electrical men are called upon to do, but I was very pleased to hear a sergeant say one day that he liked to have electrical men in his section, because they were so adaptable! We get some very interesting jobs, and get over them in record time. Only a couple of weeks ago we installed a complete plant, engine, generator (bed for same), mains, and switchboard, after 6 o'clock in the evening. We are just keeping in training for all the extensions to plant after the war. I only hope that that happy time will soon be here."

Discharged Soldiers and Motor Work.—The Central Committee for the Employment of Discharged Soldiers and Sailors draws attention to the position of such men with respect to the motor industry. It is considered inadvisable for men who have not already trained as drivers to do so now. Among the reasons given are the cancellation of private petrol licences and the difficulty at present found in obtaining work for highly-skilled men of many years' experience. Thousands of unskilled men who were enlisted and are now, after training, coming back to civil life, will be anxious to remain at motor work. Although there is, generally speaking, an over-supply, the committee say there is a certain demand for men who are capable of undertaking work on commercial cars and on agricultural tractors, but in both cases the work is somewhat heavy, and therefore not suitable for men who have been badly injured.—*Times*.

British Westinghouse War Relief Fund.—A full statement of receipts and payments in connection with the British Westinghouse Employés' War Relief Fund was submitted to a meeting of delegates held on Friday last in the Women's Canteen at Trafford Park. The number of employés with the Forces to date is 2,702, and the casualties have been exceedingly high. The dependents who received allowances at June 30th, 1917, was 718. The accounts cover the period from August 24th, 1914, to June, 1917. The total receipts stand at £44,108, £29,103 of which was contributed by em-

ploies and £13,990 by the company, the remainder consisting of donations and interest. There has been paid out to dependents £25,836, £11,678 has been set aside for a Disablement and Dependents' Fund, and over £2,080 has been spent in donations to local and national funds, Christmas gifts, and payments to Red Cross workers.

Trading with the Enemy.—The "London Gazette" for August 31st contains a further list of persons and bodies in the following countries with whom trading is prohibited: Argentina, Paraguay, Uruguay, Brazil, Chile, Colombia, Greece, Netherlands East Indies, Norway, Peru, Spain, and Sweden, also particulars of a number of removals from previous lists.

German Industrial Census.—According to the "Hamburgischer Correspondent," a census was to be taken on August 15th of all industrial and trade establishments throughout the German Empire. The object of this census is stated to be the collection of statistical data considered necessary for the successful economic prosecution of the war and to facilitate the transition of the German economic system from war to peace conditions. The census was to include all Germans engaged in industry, whether as manufacturers, independent master craftsmen, tradesmen, or home industrial workers, and was to be carried out through municipal and communal authorities.—*Financier*.

Small Supplies of War Material.—According to the *Morning Advertiser*, at the West Ham Court, last week, Samuel Coster, 43, an electrical engineer, was charged, on remand, with entering into negotiation, without a permit, for the sale of 30½ lb. of alloy worth £16; and also with having under his control alloy required for the production of war material. Detective-Sergeant Mould said he had been to the Ministry of Munitions, and he was told that there was no intention to prosecute, it being held that the Act was not intended to apply to such small quantities. The accused was then discharged.

Reconstruction in France.—A law, promulgated on August 6th, authorises, *inter alia*, the Minister of Commerce, Industry, and Posts and Telegraphs to expend a sum not exceeding 250,000,000 frs. (about £10,000,000 at par) on the purchase of raw materials, plant, &c., necessary for the re-establishment of industry in the invaded districts of France. Plans for the purchase of material, &c., will be drawn up by three Commissioners acting under the direction of an Office of Industrial Reconstruction, consisting of eight representatives of the Government Departments concerned and eight representatives of commerce and industry (of whom four are to belong to the invaded districts). The Office is to be established at the Ministry of Commerce.—*Board of Trade Journal*.

Where Germany gets Copper.—The Serbian copper mines are now being intensively exploited by the Germans and Austrians, and good copper deposits are also said to have been found in Poland. Work has recently begun in the lead and copper deposits in the district of Kielec, and in the neighbourhood of Miedziana, Lysa Gora, and Olkuss the methodical exploitation of these ores has already been started. The existence of copper in this district has long been known, but under Russian rule the deposits were neglected, as the authorities devoted all their attention to the exploitation of the mines in the Urals.—*Ironmonger*.

Niagara Power and Munitions.—The "Times" correspondent at Toronto reports Mr. Lucas, Attorney-General of Ontario, as believing that a revision of the treaty between Great Britain and the United States regulating the use of the water of Niagara Falls may be necessary. "There has been an acute shortage of power in Ontario. Under the treaty the United States is allowed to use 20,000 cu. ft. a second and Canada 36,000 cu. ft. Recently the Ontario Hydro-Electric Commission secured an Order in Council authorising the expropriation of exported power in order to relieve the situation. But even this does not meet the domestic demand. If export is prohibited many American industries will be embarrassed. The increased use of power on both sides is largely due to the demand for the manufacture of munitions. It is suggested that the treaty be revised to allow both countries to divert more water from Niagara river."

Indiscriminate Granting of Trade Protection Cards.—At Bermondsey, Messrs. Sadler & Co., engineers, in applying for the further exemption of a turner and fitter, 37, passed for labour abroad, stated that they had applied for a trade protection certificate for the man, but had been told by the officers that they had better stick to the Tribunal as long as they could. Consequently they were not granted a certificate. The Military Representative (Lieutenant J. A. Davie) said this man was fully entitled to the protection certificate. These certificates were being issued to men not entitled to them, but men fully entitled to them could not get them. In one case he learnt that a boy of 19 had been granted a certificate, and on visiting the factory where he was employed he found that he had been granted a protection certificate for the stamping of cakes of soap. On the day of his visit a woman was doing his work, as the boy was away on holiday. In another case, a man, 26 years old, passed for general service, engaged by a firm of coal merchants doing odd jobs in their coal wharf, had obtained a protection certificate. The Tribunal had refused his appeal for exemption,

and he had lodged an appeal with the Appeal Tribunal, but whilst his case was pending he obtained the protection certificate. He thought the Tribunal ought to draw public attention to the way these protection certificates were being obtained. The Tribunal instructed the Town Clerk to communicate with the Government Department responsible for granting the protection certificates, drawing attention to the indiscriminate manner in which they were being issued. Applicant was granted two months' exemption.

At Camberwell, Mr. W. J. A. Westcott, 35, passed for general service, managing director of Messrs. Arthur Adams and Co., Ltd., tin box manufacturers, of Meeting House Lane, Peckham, appeared, at the request of the Military Representative, to show cause why his certificate of conditional exemption should not be withdrawn. He informed the Tribunal that he had been granted a card of exemption under the Protected Trades Schedule. The Military Representative said that this was not a business of national importance. Mr. J. Nisbett replied that evidently the Ministry of Munitions thought it was, for they had granted him an exemption certificate. Applicant said he held direct Government contracts for the manufacture of tin boxes. The Military Representative said there were many men in the borough holding these trade cards engaged in businesses which were not of national importance, and they did not know under what conditions they were obtained. He did not wish to reflect on this case, but he found that all sorts of dodges were being resorted to in order to get the cards. Tin box manufacturers were not included in the list of certified occupations, and he thought the man ought to join the Army. Sir Evan Spicer said the question for the Tribunal was whether this business was to be thrown away, even though it had grown out of the war. The Military Representative said if they were going to keep young men like this out of the Army, especially if they were fit, they might as well "throw up the sponge." It was decided to cancel the exemption granted by the Tribunal, which deprived the applicant of any further right to an appeal at the Tribunal should his card be withdrawn by the Ministry of Munitions.

Exemption Applications.—At Batley, three electrical engineers' certificates were reviewed. H. Hainsworth (37, in charge of a large engineering firm), who possessed an M.A.R.O. certificate, and had been working 90 hours a week on shell factories contract work, was given a renewal of conditional exemption. A. Brook (38), electrician, with M.A.R.O. certificate, was also given conditional exemption. H. Jagger (37) was told to apply for an M.A.R.D. certificate, and submit himself for medical examination.

At the Hull Tribunal, Mr. T. Holme, the Corporation telephone manager, applied for exemption certificates in the place of the existing blue cards granted by the Military Representative to 15 telephone employees. In reply to a question as to what was the position of the military in relation to these men, Captain Chapman said that they were already exempted, but the certificates granted were now out of date, and they required Tribunal certificates, to which the military offered no objection. The Humber Garrison and the York Command had told them what they had to do, and the telephone employees had to do it. As a matter of fact, he believed every one of the men would have to go under military control absolutely. In regard to replacing the A men, Mr. Holme said the 15 names were put forward in agreement with the local military authorities and themselves for substitution. They also communicated with the National Service Department, and gave details of the men they wanted. Only four had been substituted, and that was why he was making the application. It was not suggested that the whole of the 15 should be substituted, but only those under 31 years of age. Mr. Gibson asked if there was any objection to the men doing four hours per week dock guard duty, and in order that the decision of the military might be obtained, the issue of the new certificates, which was agreed to, was deferred.

At the Hull Tribunal, the Tramways Committee applied for three men engaged as armature winders. One was classified B1 and the other two C1. The staff had been before the Advisory Committee, who had taken all the A men. A representative of the department said that if these men were taken it would mean that the whole tramway system would be stopped. Conditional exemption was allowed.

At the South Yorkshire Military Appeals Court, on Saturday, 17 cases concerning employees of the Rotherham Corporation tramways were considered. According to the *Yorkshire Post*, in each case the Military Representative appealed against an exemption granted by the Local Tribunal. Fifteen drivers were among those concerned. The statement submitted on behalf of the Corporation was that they were doing their best to get substitutes, as shown by the fact that they had arranged to release six of the 17 men as soon as substitutes were efficient. They had 30 substitutes sent down, but only 10 remained. The traffic manager informed the Chairman that it was not desirable to utilise women as substitutes for motormen, as was done in Doncaster and elsewhere, as the gradients on some of the routes were dangerous. Two of the men were ordered to join up, and others were given until November 30th, but the Chairman said the Tribunal felt strongly that all the men should eventually find their way to the Colours. The exemption would not be made final,

and the management had better do all it could to find substitutes, women or otherwise, as the prospect was that the men concerned would have to go.

Renewed exemption to January 1st has been granted to A. A. Clements (36, C1), electrical engineer, Taunton.

At Surbiton, the Electricity Supply Co. appealed for a meter mechanic (27, C2), and three months were conceded.

At Oxford, the Military appealed against conditional exemption held since June 19th, 1916, by W. Bnsh (40, B1), scientific electrical instrument maker, engaged at the Electrical Laboratory, Parks Road. Prof. Townsend stated that Bush was engaged on the construction of wireless apparatus for the Royal Naval Air Service, under his direction, and Lieutenant Owen said that he ought to be protected by the Admiralty. The exemption was cancelled.

Bath Tribunal has granted three months' exemption to A. H. Leonard (29, C2), electrical engineer at the Grand Pump Room Hotel.

At Whitby, the electrical engineer to the U.D.C. (Mr. J. Piggott) appealed for a shift engineer (19, C1), and said that an efficient substitute, suggested by the Military, would require months of training before he could satisfactorily undertake the work and acquire local knowledge of the situation of cables, &c. The appeal was disallowed.

Before the Eton Rural Tribunal, exemption was sought for V. H. Froud (37, B2), electrician at the Stoke Park Golf Club. Three months were allowed, the case to be then reconsidered.

At Oxford, a review was made of exemptions, granted on the ground that they were necessary for the efficient running of the services, to H. Wyatt (31, general service) and F. L. Chatwin (33, general service), engaged with the Oxford Tramways Co. The company claimed that the men were indispensable, but the appeals were allowed, and a month's temporary exemption granted, with leave to appeal again.

IMPORT TRADE OF PERU.

THE following statement, showing the imports of electrical and allied goods into Peru during the year 1915, is extracted from the recently-issued trade statistics. The figures for 1914 are added for purposes of comparison, and notes of any increases or decreases are given:—

	1914.	1915.	Inc. or dec.

BUSINESS NOTES.

Book Notices.—"Theory of the Submarine Telegraph and Telephone Cable." By Dr. H. W. Malcolm. London: The Electrician P. and P. Co., Ltd. Price 18s. net.

"Engineering Directory." No. 64. July, 1917. London: Engineering, Ltd.

"Laws of Physical Science." By Dr. E. F. Northrup. London: J. B. Lippincott & Co. Price 8s. 6d. net.

Brazil.—The American Consul at Rio Grande, Rio Grande do Sul, states that the importation and distribution of foreign merchandise in the State of Rio Grande do Sul have been controlled chiefly by German houses, which endeavour to import everything possible from Germany. "In the electrical line this was particularly true, but, in spite of this handicap, several American electrical articles found their way to the market solely because of their superiority. There are some 45 electric light and power companies furnishing service in the various municipalities of this State, and there is a constant demand for plain lamps, fixtures, fans, small motors, and supplies. The trade is principally in the hands of the hardware dealers, all of whom carry some electrical equipment, and certain ones make a speciality of electrical goods. Certain electrical specialties are sold in drug stores and even by the larger general stores, but, as a rule, greater effort is put forth by the hardware dealers making a speciality of these lines. American electrical irons, toasters, warming pads, &c., could find an increased sale through intelligent sales methods, which would include correspondence with the dealers conducted in Portuguese, or at least in Spanish." Attractive literature should be sent at once, stating terms and giving data showing volume and weight of goods packed for export. "Three months are often required for a reply from this section of Brazil, and it is best to give at once all possible information. In the distribution of electrical goods generally, it is better for exporters to deal directly with the importers, and not place all chances of success or failure in the hands of a general agent."

For Sale.—The Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board has for disposal 90 Reason maximum-demand indicators. Particulars are given in our advertisement pages to-day.

THE ASSETS AUCTIONS Co. will sell by auction, on September 13th, at 129, Newington Causeway, the stock of an electrical factory. For further particulars see our advertisement pages to-day.

The Rochdale Corporation Electricity Committee has for disposal one Belliss-Morcom-B.T.H. 220-KW., three-phase, 3,000-volt steam alternator. For particulars see our advertisement pages to-day.

Kilmarnock Corporation has for sale one complete D.C. switch-board for lighting and traction. For particulars see our advertisement pages to-day.

Catalogues and Lists.—BRITISH THOMSON-HOUSTON Co., LTD., Rugby.—List No. 3,313 (20 pages) contains illustrated details of their truck type ironclad switchgear, type T, forms A and B for polyphase systems up to 11,000 volts. Half-tone illustrations, outline drawings, and diagrams of connections occupy a large amount of space.

THE BENJAMIN ELECTRIC Co., LTD., 1A, Rosebery Avenue, London, E.C.—Leaflet giving illustrated description and prices of their industrial signals or interior factory calling systems for fire alarms, air raid, and general service purposes.

MESSRS. L. ANDREW & Co., 2, Whitworth Street West, Deansgate, Manchester.—Net wholesale price circular of india-rubber gloves and gauntlets.

Fire.—Press reports state that the premises of Bradbury and Co., manufacturers of electric light fittings, of Woodcock Street, Birmingham, were gutted by fire on Tuesday morning.

Liquidation.—FIELD BROS. & Co., LTD.—The Controller, Mr. J. E. Percival, has applied for his release.

Trade Announcements.—MESSRS. QUEAD, LTD., have appointed the Western Electric Co., Ltd., of 49, West Campbell Street, Glasgow, as sole agents for the sale of their patent "Quead" fires in Scotland.

THE BRUSH ELECTRICAL ENGINEERING Co., LTD., have removed from No. 1, Kingsway, to Maxwell House, Arundel Street, Strand, London, W.C. 2.

LIGHTING AND POWER NOTES.

Aberdeen.—YEAR'S WORKING.—The annual report by the Corporation electrical engineer, Mr. J. A. Bell, states that the total income for the year to July 31st was £76,369, an increase of £496, while the total working expenses amounted to £47,215, an increase of £8,035. The gross profits amounted to £29,153, a decrease of £7,539. There was a deficit on the year's working, which was taken from the reserve fund, now standing at £39,304, of £315. Summer Time, early shop closing, and lighting restrictions have reduced the revenue by £1,076, and a reduction of 5 per cent. on the previous year's charges, has reduced the revenue £1,192 for lighting, £1,162 for power and heating, which reductions have been counterbalanced by the increase in sales for power. Mr. Bell explains that, owing to the war, the advance in power uses has been on a scale never experienced before.

Bolton.—The electrical engineer (Mr. W. J. H. Wood), at the request of the Coal Controller, is to co-operate with Mr. J. A. Robertson, as local representative for the South Lancashire and Cheshire districts with a view to securing economy in the consumption of coal.

Canada.—ONTARIO HYDRO-ELECTRIC PROPOSALS.—In a recent letter to the *Electrical World*, Mr. R. P. Bolton discusses the financial possibilities of the Ontario Hydro-Electric Commission's acquisition of the Ontario Power Co., which was rendered necessary by the proposed power development at Queenston by the Commissioners. The water which the Power Co. used provided a development of 180,000 H.P. on a fall of 160 ft., and the same volume of water at Queenston, with a head of 310 ft., will develop about 390,000 water H.P., or 300,000 electrical H.P., at an estimated cost of \$50 per electrical H.P. But the new development will still be burdened by the investment on the existing plant, and Mr. Bolton considers that the cost of the Queenston project added thereto will still leave the figure at \$126 per H.P., which is that of the Ontario Co.'s property. He calculates that the operating and fixed charges will amount to \$16.57 per H.P., which is greatly in excess of the price at which the Commission has hitherto purchased its service.

According to the *Financier*, the Imperial Privy Council has granted leave to the Electrical Development Co. to appeal against the decision of the Ontario Courts denying the company the right to proceed against the Attorney-General of the Province and the Hydro-Electric Commission with regard to the contemplated Chippewa development. The Electrical Development Co. contends that the original franchise given by the Government stipulated that it would never take water from the Niagara or Welland Rivers (Chippewa River) to compete against the company. It is suggested that if this covenant is binding, it would apply as much to the taking of water through the works of the Ontario Power Co. as in any other way. The Chippewa power plant would provide a development of 500,000 or 600,000 H.P., at a cost of about \$30,000,000.

Cardiff.—LINKING-UP.—The electrical engineer and manager has submitted a report on the question of linking-up the various power stations in the South Wales area, in connection with which a Committee has been formed, of which he has been appointed chairman. He asked for the authority of the Electricity Committee to go more closely into the question of details, including estimates of cost, &c., in order that the same might be submitted at a later date to this Committee for consideration, and at which time it is intended that the Committees of the various local undertakings should appoint representatives to meet together to finally discuss the matter. The Committee agreed to this, and will contribute to the united Committee similarly to other electrical undertakings on the basis of their annual revenue, the amount of the subscription for the Cardiff undertaking being £10.

Colne.—SALARIES.—The T.C. has decided to give the Corporation officials a war bonus of £25 per annum. When the war commenced it was decided to leave over the question of increases of salary, but it was felt that, as most workmen were now in receipt of more or less substantial war bonuses, the officials should also be granted a contribution towards the increased cost of living.

Continental.—FRANCE.—La Société des Forces Motrices de la Truyère is the name of a new company which has just been formed in Paris with a capital of £600,000, to establish a large hydro-electric plant to utilise the water power of the River

Truyère, the Société des Mines de Bruay, and the Société des Forges de Chatillon-Commentry-Neuves Maisons are interested in the new undertaking, the main object of which is to supply the electrical energy required for the new electric steel plant which is at present in course of construction by the Chatillon-Commentry Co. It is stated that the hydro-electric plant to be established will have a capacity of 36,000 H.P.

SPAIN.—Following the experiments at its Marie Luise Pits, it is reported that the Sociedad Metalurgica Duro-Felguera has decided to adopt underground electric traction in the whole of its collieries.

ITALY.—According to the American Consul, in the City of Venice there are over 1,200 users of electric light and over 1,000 users of electric power. Electricity is generated by water power, and as coal is scarce and high in price the number of power users is large everywhere in the Veneto, and is constantly increasing.

According to a paragraph in *L'Economista d'Italia* for August 25th, the Municipality of Turin has under consideration a large new hydro-electric station in Valle dell'Orco. The scheme will comprise (1) the construction of two barrages on Lakes Serru and Agnel, in the valley, capable of storing 7 million cubic metres of water, and a branch on the Ceresole plain, on the left slope, of an average capacity of 2,200 litres, with a minimum of 1,450 litres; (2) a barrage on the Telesio plain and Lakes Balma and Eugio, to form a basin of 15 million cubic metres; (3) a branch, from the Valle dell'Orco to the Valle della Centrale del Rossone, on the left bank, where all the water from higher up will be collected. According to estimates received, the new installation will give 20,000 KW., and will cost 40,740,000 lire (£1,629,600).

Dublin.—At a meeting of the Corporation, last week, objection was taken by Mr. Moran to certain extra payments to employés of the city electricity department. Mr. P. T. Daly said it was curious that two men were always mentioned as having done the overtime. Mr. Sherlock stated that some members thought the men referred to were favoured by the chief engineer because they were associated with him in other matters. Alderman Farrell declared that, in his opinion, Mr. Ruddle was not a free man; some of the officials even threatened him in his office. The paragraphs relating to overtime payments were deleted.

Dundalk.—The Urban Council has adopted a report of the Electricity Committee, in which it was stated that a satisfactory settlement had been arrived at in the arbitration on matters in dispute with Messrs. Brook, Hirst & Co., contractors for a new switchboard in connection with the supply meters at the Great Northern Railway (Ireland) sub-station. The contractors had agreed in each matter, and had, in addition, paid the arbitration expenses.

Fife.—**STEEL FURNACES.**—A 5,000-H.P. steam turbo-generating set has just been installed at the works of the National Steel Foundry (1914), Ltd., at Leven, to supply the current for the electric steel melting furnaces, and for other purposes. The company has at present two electric steel furnaces, one being of the Snyder, and the other of the Heroult type; a third furnace is, however, in course of erection, and is expected to be in operation at an early date.

Glasgow.—**YEAR'S WORKING.**—The twenty-fifth annual report of the Corporation electricity undertaking, for the year ended May 31st, 1917, shows a gross revenue amounting to £580,433, and working expenditure to £404,404, leaving a gross profit of £176,029; interest, £83,039, sinking fund, £76,049, and depreciation, £55,606, absorbed £214,695, leaving a deficit on the year's operations of £38,666, to meet which a sum has been transferred from the reserve fund account, which now stands at £19,172. The revenue account shows an increase of £49,713, but the working expenses have increased by £81,752, due apart from the larger output to the increased price of coal, materials and workmen's wages: £5,885 has been paid to dependents of employés on active service.

Capital expenditure during the year amounted to £255,353, and the total capital expenditure at the end of the year, less depreciation written off, stood at £2,835,297; the total depreciation written off the capital account to May 31st amounts to £766,915. The consumers at May 31st last numbered 31,724, as compared with 33,605 in the previous year. The total units generated were 162,398,668, including 5,139,217 purchased from the tramway department; the total units sold were 111,196,627, as compared with 112,794,461 in 1916. The units sold to private consumers were 140,513,680, an increase of 30,025,058, equal to 27.17 per cent.; of these, 20,474,183 units were for lighting, and 120,039,497 for power. The total number of motors connected was 12,101 of 97,733 H.P., and the units consumed amounted to 117,547,855, as compared with 11,172 motors of 84,744 H.P. and 88,596,457 units in the previous year. The total connected load was 123,180 KW., as compared with 109,370 KW.; and the maximum demand on December 21st last was 49,185 KW.

The report states that the foundation contract and river work of the new Dalnarnock works is now practically completed, and that plans and specifications were shortly to be issued for the buildings, boiler house, turbine room and switch house, and that permission has been obtained for orders being placed for two 15,000-KW. turbo-alternators and necessary boilers. It is hoped that a third 8,000-KW. turbine set will be ready for this winter at Port Dundas station, bringing up its capacity to 46,600 H.P.; a similar sized turbine has been supplied to Pollockshaws Road station, making the plant capacity 57,000 KW. The Govan and Partick plants represent 4,450 H.P. and 2,650 H.P. respectively.

Contracts have been entered into for the supply of coal for the coming year at practically the same price as in the year just closed.

The Committee recommends that the charges for electrical energy as from the date of last survey of the financial year 1916-17, and until further notice, be:—For private lighting in shops, warehouses, theatres, &c., 5d. and 1½d.; domestic lighting, 4½d.; for power, 2d. and 1d. per unit, 500,000 units and over, 1½d. for the first 250,000 units, and ¾d. for the second 250,000 units; special supply, 1d. and ¾d. per unit. Heating, other than domestic, 1½d. per unit; special rate to domestic consumers, 1d. per unit; where a special meter is to be installed for heating or cooking supply, 1½d. per unit; the KW. charge to be increased by 15 per cent. plus a running charge, which will vary with the price of coal.

Hebden Bridge.—**BULK SUPPLY.**—The U.D.C. has made an agreement with the Halifax Corporation for the supply of electricity in bulk to Hebden Bridge for a period of seven years from September 9th. The Corporation is to supply all mains, plant, and apparatus, and the Council is to carry out the laying of the cable between the Corporation's existing station and the Council's electricity works.

Hove.—**PRICE INCREASE.**—From September 30th the charges for current for power will be increased to 2d. per unit on the flat rate and by 10 per cent. on the indicator rates of charge.

Ireland.—The rising cost of illuminants is again drawing attention to the advantages of electricity and its cheapness when water power can be had on the spot. Few countries are more favoured with rivers and streams, and the wonder is that such power is left untapped in so many places, particularly in the south and west, where many towns and villages are built on rivers, &c. Another matter for wonder is that there is not more propaganda on the advantages of electrical lighting.

London.—**DEPTFORD.**—The General Purposes Committee reports that a letter has been received from the Clerk of the L.C.C. referring to the question of the electricity supply of London. The County Council now suggests that a further Conference should be held, and in this connection the Clerk states that he presumes that if a Committee exists, this Council would wish to be represented at the further Conference by such Committee, and not by individuals. As a matter of fact, the Councils not owning electricity undertakings have not appointed a representative Committee.

Maidstone.—**YEAR'S WORKING.**—The report of Mr. Hoadley, the borough electrical engineer, on the electricity undertaking for the year ended March 31st last, shows that the total revenue amounted to £22,736, the total costs to £14,463, and the gross profit to £8,273—these figures comparing with £19,771, £13,532, and £6,239 respectively in the previous year, while the net result after meeting capital charges was a profit of £1,186, as against a loss of £256 in 1916. The output sold was 3,236,741 units, as against 2,753,788 units in 1916; power supply absorbed 2,435,033 units, an increase of roughly 460,000, while heating and cooking supply more than doubled. With this respectable increase in the day load (the lighting load fell off at the same time), the load factor improved to 29.6 per cent., and the working conditions were further improved by the use of a Ljungstrom turbine plant, so that the total operating costs fell from 1.075d. to .995d. per unit (coal cost falling from .604d. to .589d.). Had not technical difficulties with a converter plant interfered with the continuous use of this turbine, the savings would have been much greater. The connected load was 117,780 equivalent 30-watt lamps and the maximum load 1,246 KW. The gross profit amounted to 13.6 per cent. on the outstanding capital.

Mexico.—**TAXES ON ELECTRIC LIGHT AND POWER.**—H.M. Chargé des Archives at Mexico City reports that as regards certain special stamp taxes imposed on, *inter alia*, electric lighting, a new arrangement has come into force, whereby the company supplying the service is responsible to the Government for a tax at the rate of 10 per cent. on the actual consumption, as shown on the bill of the consumer. This tax is to be collected by the company. Persons using not more than three lamps are exempt from the tax. No tax will be levied on signs and advertisements, special illuminations, charitable institutions and schools, public lighting, and federal and municipal buildings.

A tax on electric power has been fixed at 3 per cent. on the amount of the bill of the consumer. Exemptions from this tax are Government installations, power sold to other companies which are not consumers but who resell and distribute, and power supplied for irrigation and agricultural purposes.—*Board of Trade Journal*.

Newcastle-under-Lyme.—**YEAR'S WORKING.**—For the year ended March 31st the Corporation electricity department had a revenue amounting to £3,435; the working expenditure was £1,972, and, after providing for financial charges amounting to £1,715, a deficit of £253 resulted. The total units sold were 225,880, as against 257,216 in the previous year; the maximum load was 177 KW.

New Zealand.—The Christchurch City Council has decided, in view of the Public Works Department being unable to meet the Council's increased demands for electricity during the next two years, on account of its inability to obtain the necessary plant to extend the Lake Coleridge generating station, to install a producer-gas stand-by plant, at a cost of several thousand pounds. The Department has been asked to pay a share of the cost, seeing that the outlay is necessitated by its inability to fulfil its contract to supply power.—*Otago Weekly*.

Shipley.—The U.D.C. has approved the advances in wages recommended by the Association of Engineers to the engineers in the electricity department. After consideration of a letter from the General Labourers' Union with regard to the wages of fitters and switchboardmen, the Council agreed to alter the war-time payment of men employed 60 hours per week.

Stratford-on-Avon.—**PROPOSED PRICE INCREASE.**—The Electricity Co. has asked the T.C. for consent to a further increase in the price of current from 6d. to 6½d. per unit for the period of the war and 12 months after. The matter has been referred to a Special Committee for consideration.

Venezuela.—An American Consul states that the Maracaibo Electric Light Co., which started operation in 1888, is now furnishing electric power during the daytime. The capacity of the plant has been increased fourfold during the last two years. During the same time the company introduced the United States standard three-phase, 60-cycle system, with standard voltages. An American is the chief engineer for the plant. In view of the fact that electric power is now being furnished during the day, it appears there will be good opportunity for the sale of electric motors for industrial purposes. No large motors will, however, be required. Gradually, no doubt, there will be developed a demand for electric fans. Opportunities for the sale of electric heating and cleaning appliances do not appear favourable at present.

Wrexham.—**PRICE INCREASE.**—The T.C. has increased the charges for current for lighting and heating by another 15 per cent., making a total increase during the war of 25 per cent., and for power by 6½ per cent., making a total advance of 16½ per cent.

TRAMWAY AND RAILWAY NOTES.

Birkenhead.—**YEAR'S WORKING.**—The working of the Corporation tramways for the year ended March 31st last resulted in a total revenue of £80,748, an increase of £7,926 over the previous year; the working expenses amounted to £42,106, leaving a gross profit £38,641, and, after making provision for interest, sinking fund, and income-tax, &c., of £24,989, the net balance remaining is £13,652, an increase of £3,082 on 1916. The balance has been allocated as follows:—In aid of rates, £2,820; to reserve fund, £5,000; and to renewals fund, £5,832. The credit to reserve fund now stands at £8,192, and to renewals at £34,338. The car-mileage was 1,186,186, as against 1,176,951 in the previous year, and the passengers numbered 17,950,433, as against 16,676,022 in 1916.

Lancashire.—**TRAMWAY WAGES.**—The application of the Lancashire and Cheshire Tramway Workers for an advance in wages was considered at a conference in Manchester on Friday, August 31st, of the Lancashire and Cheshire Tramway Federation. It was decided to refer the question to the Committee on Production.

The Manchester Corporation and its employes have already agreed to a similar reference, and it is understood that a joint arbitration will be held for the whole of Lancashire and Cheshire.

Peru.—The Lima electric railway system is operated by the Empresas Electricas Asociadas, a company combining the three previous railway companies, which operated cars in Lima, between Lima and Chorillos (8 miles), and between Lima and Callao (9 miles); the old English line between Chorillos and Callao, *via* Lima, is worked for goods traffic. Altogether some 75 miles of single track, 135 passenger cars, and six electric locomotives are operated.—*Electric Railway Journal*.

Kingston-on-Thames.—**ACCIDENT.**—On Saturday morning, last week, a car belonging to the London United Tramways Co., while descending Kingston Hill, left the track and crossed the road, knocking down a tree and the iron standard supporting the overhead work. The collision with the standard caused the car to swing right round, the top being torn off and the body smashed; the only passenger, a lady, was injured about the head, and the driver was also hurt; the conductress was so seriously injured that she was detained at the Kingston Infirmary.

Preston.—**YEAR'S WORKING.**—The revenue account of the Corporation Tramways for the past year shows a gross working surplus of £21,746, as compared with £20,131 and £17,483 in the two preceding years. The traffic receipts have risen from £45,618 in 1913-14 to £57,683 last year, but working expenses, including allowances to employes on war service, show an increase of £6,444 over the year just quoted, whilst the increase during the past year has been £4,827. The power expenses alone are £1,950 greater than in the previous year.

Newcastle.—The City Council has approved of air raid warnings at night being given by interrupting the tramway supply for a minute, and after resuming supply, finally cutting it off. During the day, current will be cut off and a red flag displayed on each car.

YEAR'S WORKING.—At a meeting of the Corporation Tramways Committee, the annual financial statement of the undertaking was submitted. The total revenue of the tramways for the year ended March 31st last was £356,534, an increase on the previous year of £31,840; the total working expenses were £208,299, compared with £192,648.

Deducting working expenses, there was a sum available of £148,236, compared with £132,046 for the previous year; interest on investments, &c., brought the total available to £154,619, which was equivalent to 43 per cent. of the gross receipts. Out of the last-named sum the following charges had been met:—Allowances to the dependents of men on service, £15,939; special rents, £1,541; interest on capital, £26,776; redemption of debt, £46,009; interest on old horse tramway loans, £1,449; making a total of £91,716. The balance has been appropriated thus:—Income-tax, £15,815; contribution in aid of rates, £7,000; insurance (third party) reserve, £2,065; renewals fund, £37,992. The sum transferred to the renewals fund was £14,132 larger than in the previous year. Owing to the fact that labour and materials had been difficult to obtain, the repairs and renewals to the permanent way had not been carried on as in former years, consequently only the sum of £9,562 had been spent during the year, being £11,190 less than was spent in 1916.

Mr. R. Mayne, the chairman, in moving the adoption of the report, said it was satisfactory to note, in view of the heavy expenditure which would be required in the future, that there was now practically £106,000 in the reserve and renewals fund. The cost of renewals for some years to come would be considerably heavier than in pre-war times, and it would be advisable to appropriate the whole of the present year's surplus to that purpose. Every endeavour would be made to carry on the undertaking without having recourse to increasing the fares, and it was to be hoped that the traffic returns would be such as to avoid having to make any alteration to the existing fares and stages.

Rawtenstall.—**STRIKE.**—The employes of the Corporation tramways ceased work on Sunday and Monday last, owing to a dispute in regard to the war bonuses paid to women and boys, causing considerable inconvenience to local holiday makers.

Sydney.—**CITY RAILWAY.**—The N.S.W. Cabinet has decided to discontinue the work of constructing the city railway; all work is to be immediately closed down, except such as is necessary to remove the obstruction in Macquarie Street. In making this announcement, Mr. Fuller stated that whatever loan money might be available in the near future for the Railway Department would be devoted to the construction of rolling stock necessary duplications, and to carrying to completion such lines of a revenue-producing nature as had already been started.—*Sydney Daily Telegraph*.

According to the *Sydney Morning Herald*, in the first year of the war practically seven millions was expended on the project, in the second year over eight millions, and in the third, which ended on June 30th last, about seven millions.

Wolverhampton.—The temporary suspension from time to time of the Corporation tramways was explained by Mr. S. T. Allen, the borough electrical engineer, as due to increased demand for electricity on the part of the factories in the town and delay in obtaining the use of new plant which has been ordered and has not yet been completed. It is hoped, with economy on the part of the consumers, to keep the supply going until the first of the new generating sets now being completed is running.

TELEGRAPH AND TELEPHONE NOTES.

Italy.—A powerful wireless station is being erected with all speed at the instance of the Ministry of Marine in a spot in central Italy unnamed. The station, says *l'Elettrotecnica*, will be built and equipped on a new system, radically different from those constructed hitherto by the larger European wireless installation companies. The latest types of American transmitting and receiving apparatus will be installed, under the special supervision of the Minister of Marine. The opening of the station is expected to take place shortly, thus constituting a record for speed of construction.

Damage to Insulators.—At Blackburn County Police Court, on August 30th, three youths were summoned for unlawfully and maliciously breaking an insulator on a telegraph pole at Mellor. Cornelius Coward, of Preston, Inspector of Telegraphs, stated that in his area, which covered a radius of 18 miles from Preston, there had been considerable damage this year. No fewer than 3,000 insulators had been broken, representing about £520. On the road in question, which carried nothing but trunk wires, which were used for important war work, 178 insulators had been broken, representing over £31. Defendants, who denied the offence, were each fined 10s., and ordered to pay 4s. 6d. each expenses.

Denmark.—U.S. Consul-General Winslow reports that the total earnings of the State telegraph and telephone systems in 1916 were about \$1,800,000, the telegraphs accounting for \$1,175,000. Maintenance, salaries, &c., totalled \$1,170,000, leaving a net profit to the State of about 18 per cent. on the capital invested.

Norwegian Wireless Station.—A wireless station is in course of erection, with a view to opening communication with America. The station, which is near Stavanger, will have its receiving station at Narbo. The contractors are pledged to hand it over for working within the current year.—*Den Tekniske Forenings Tidsskrift*.

Portugal.—The postal and telegraph services have been temporarily deranged by a strike of officials. The Government has decreed that the entire staff of the departments is incorporated in the army, and that absentees will be treated as deserters, and the situation is now normal.

Spain.—By a Royal Decree, bearing date June 8th, all private existing and projected wireless stations transmitting and receiving, or receiving only, for whatever purpose used, are made subject to Government inspection. The inspection will be carried out by officials of the Telegraph Department, and its objects are to watch over public interests and order, to safeguard the State wireless system, and the fulfilment of the stipulations regarding material and the terms of concessions. Breaches of the regulations will be followed, in minor cases, by fines, or, in the graver cases, by the confiscation of the concession and plant and a heavy fine.—*La Energia Electrica*.

Sweden.—A Commission has been appointed to arrange for the erection of a wireless station at Karlsberg, which is to communicate with other international systems.

Telephone Directory.—Owing to the scarcity of paper and labour, it has been decided to defer the next issue of the Telephone Directory for three months, until January, 1918, and to publish two subsequent issues at nine-month intervals, in October, 1918, and July, 1919.

CONTRACTS OPEN AND CLOSED.

OPEN.

Australia.—MELBOURNE.—October 10th. Department of the Navy. Pumping plant and equipment for the Commonwealth Naval Dockyard, Cockatoo Island, Sydney. Specifications from the Director of Navy Contracts, Melbourne.

Dublin.—September 11th. Electricity Supply Committee. Twelve months' supply of cables, troughing, bends, section pillars, service boxes, &c. See "Official Notices" August 31st.

London.—BERMONDSEY.—Sept. 7th. B.C. 500-KW. rotary converter. See "Official Notices" August 3rd.

Manchester.—September 17th. B. of G. Installation of a telephone system at the offices, All Saints. Particulars from Mr. J. Macdonald, Clerk.

Spain.—The municipal authorities of Castrillo de Villavego (Province of Palencia) have lately invited tenders for the concession for the electric lighting of the town during a period of six years.

Stockton-on-Tees.—September 10th. District Fund Gas and Electricity Committees. Stores, &c., for six months. See "Official Notices" August 31st.

CLOSED.

Cootehill (Co. Cavan).—Urban Council. Generator (35 lights), £40: Mr. Robert Coyle.

Manchester.—Electricity Committee. Accepted tenders: Superheater tubes, &c.—Babcock & Wilcox, Ltd. Lea recorders.—Lea Recorder Co., Ltd.

Salford.—T.C. Accepted tenders:—

Edison's Electric Accumulators, Ltd.—Two-ton electric vehicle with automatic tipping body, £1,125.

W. T. Glover & Co.—Low tension, paper-insulated, lead-covered cable, £177.

British Westinghouse Co.—One 300-kw. rotary converter set, £1,535; switchgear, £551.

Fernanti, Ltd.—One 250-k.v.a., three-phase, oil-cooled power transformer, £274.

FORTHCOMING EVENTS.

Birmingham and District Electric Club.—Saturday, September 8th. At 7 p.m. At the Swan Hotel, New Street. Paper on "The Manufacture of Commutators for Electrical Machinery," by Mr. A. P. Green.

Salford Technical and Engineering Association.—Saturday, September 8th. At 7 p.m. At the Royal Technical Institute, Peel Park. Paper on "Transmission of Power by Chains," by Mr. H. T. Hildage.

NOTES.

Legal.—PRICE v. HOOK.—In the City of London Court, on Tuesday, before his Honour Judge Atherley-Jones, K.C., a claim was made by Mr. Charles E. Price, accountant's clerk, against Mr. Charles Hook, trading as the Times Electric Co., Ltd., electrical manufacturers, Godliman Street, E.C., to recover the sum of £32 for balance of salary and for services as a book-keeper and secretary of the company, as well as a claim for a bonus. Mr. Griffiths appeared for the plaintiff, and Mr. Valetta for the defendants. Mr. Griffiths said that the defendant was the owner of a one-man company. There was nobody in it except the defendant and his wife. Mr. Valetta said that the plaintiff had no business to have sued the defendant. It was the Times Electric Co., Ltd., which employed the plaintiff, and not Mr. Hook.

The plaintiff, in his evidence, stated that he had been in the employment of the defendant for five or six years as book-keeper. Then Mr. Hook turned his business into a limited company. He was paid £3 monthly as book-keeper, having other employment elsewhere, and retained the position of book-keeper until August, 1916, when one of the two directors was called up for military service. The other director had been secretary, and witness took the post of secretary at £1 a week, in addition to his remuneration, as book-keeper. There was now £32 due to him as the balance for the service which he had rendered. It was distinctly agreed that he was to be paid a bonus at the end of each financial year as might be decided by the directors, but the figure was not to be fixed until it had been seen what the profits were. The company made a very large profit this year, but last year there was a loss. He was not claiming for a floating bonus, but only for the minimum bonus which was agreed between them. In cross-examination, witness said Mr. Hook held 998 shares out of 1,000 which had been issued. He certainly had no intention of making Mr. Hook personally liable, except that Mr. Hook was the company.

Mr. Valetta urged that the action could not succeed against the defendant personally, and the company was not before the Court. The company had sued the plaintiff in another action to be heard in a fortnight's time for the return of books belonging to the company and £5 lent to the plaintiff. Judge Atherley-Jones suggested that the proper thing to do was to amend the summons by adding the company. Mr. Valetta objected to that, and said there was no justification whatever for the present action. Judge Atherley-Jones, K.C., was afraid plaintiff could not proceed, but he thought the defendants had misled the plaintiff in applying for particulars, and so treating the action as properly brought against Mr. Hook. There must be judgment for the defendant, but without costs, which he thought he was justified in doing, having regard to the course pursued by the defendants.

Gas Topics.—The *Times* recently drew attention to the drastic German restrictions on gas consumption. All over Germany this reduction was to equal 10 per cent. of the monthly consumption a year ago, but in Berlin new orders have been issued which, it is estimated, will reduce ordinary domestic gas consumption by a half. In view of the coming winter, this restriction, together with the reduction in coal heating, has raised a strong public protest.

The Taunton Gas Co. attributes to the lighting restrictions and the Summer Time Act a decrease in consumption of five million cubic feet during the year.

At one of the Sheffield gas works an explosion recently occurred, in which 20 persons were injured. The explosion originated in a meter house where repairs were being made and set fire to a gas-holder, which was burnt out, while a second holder was wrecked by flying fragments.

Educational Notes.—HACKNEY INSTITUTE (L.C.C.).—The new session opens on September 17th, with evening lecture and laboratory courses in electrical engineering subjects, including electrical measurements, dynamos and motors. An announcement appears in our advertisement pages to-day.

UNIVERSITY COLLEGE, LONDON.—The programme for the new session in the Faculty of Engineering has been issued, giving particulars of the courses of study, scholarships, fees, &c. Prof. J. A. Fleming is head of the Department of Electrical Engineering.

Appointments Vacant.—Overhead lineman (40s. +), for the Colne Corporation Light Railways; electrical fitter, for the South Lancashire Tramways Co.; junior assistant to shift engineer (£91), for the Worcester Corporation electricity works; electrical staff for the ordnance depôts, aerodromes, and military camps in the Southern Command; draughtsman, for the Borough of Hornsey electricity works; two engineers to take charge of shifts (55s.), for the City of Hereford electricity works. See our advertisement pages to-day.

Profit-Sharing.—In the September number of the *Financial Review of Reviews*, Mr. J. B. C. Kershaw has an article on "The Promotion of Industrial Efficiency," in which he discusses the question of profit-sharing as a means of bettering the position of the workers and increasing productivity. He expresses the opinion, which has frequently been stated by ourselves, that the amount of the bonus requires to be substantial in order to be of any practical help in satisfying demands. A bonus of 5·5 per cent. on wages can have little effect in raising the worker's efficiency or increasing his devotion to his employer's interests. A German firm found nothing under 10 per cent. to be of any value; the Lever maximum is 20 per cent., but the author is of opinion that 30 per cent. or 40 per cent. on standard wages would, in many

Theft.—On a charge of stealing a quantity of electrical appliances, fittings, and tools, valued at £100, Jesse Taylor (17), electrical test assistant, employed by the Chloride Electrical Storage Co., Clifton Junction, was bound over at the Manchester Police Court on Friday last.

cases, be justified by the results. He discusses the investment of the bonus, and, briefly, the subject of welfare work. Profit-sharing is more easily applicable and more readily accepted as part of a scheme of industrial partnership in which the general welfare of the workers is also reasonably and fairly provided for.

Institution and Lecture Notes.—The Institute of Metals.—The annual autumn meeting will be held on Wednesday, September 19th, at Burlington House, Piccadilly. At the opening session (4 p.m. to 6.30 p.m.) the following communications will be presented:—

- "Experiments on the Fatigue of Brasses." By B. Parker Haigh, D.Sc.
- "Hardness and Hardening." By Prof. T. Turner, M.Sc.
- "The Effects of Heat at Various Temperatures on the Rate of Softening of Cold-rolled Aluminium Sheet." By Prof. H. C. H. Carpenter, M.A., Ph.D., and L. Taverner.
- Note on "A Comparison Screen for Brass." By O. W. Ellis, M.Sc.

At the evening session (from 8 p.m. to 10 p.m.) the proceedings will include:—

- "Further Notes on a High-temperature Thermostat." By J. L. Haughton, M.Sc., and D. Hanson, M.Sc.
- "Principles and Methods of a New System of Gas Firing." By A. C. Ionides.
- "Fuel Economy Possibilities in Brass-melting Furnaces." By L. C. Harvey.
- "The Effect of Great Hydrostatic Pressure on the Physical Properties of Metals." By Professor Zay Jefferies, B.Sc.
- Note on "The Use of Chromic Acid and Hydrogen Peroxide as an Etching Agent." By S. W. Miller.

In connection with Mr. Ionides's paper, a demonstration of a new system of furnace heating will be given, and it is expected that this paper will give rise to an animated discussion on metal melting.

Invitations to be present at the meeting can be obtained by non-members of the Institute of Metals on application being made to Mr. G. Shaw Scott, M.Sc., secretary and editor, 36, Victoria Street, S.W. 1, from whom also particulars of the forthcoming ballot for the election of new members can be obtained. So great is the present interest in metallurgical matters, that the membership of the Institute has increased, we are informed, since January 1st last by over 30 per cent.

Junior Institution of Engineers.—This Institution has instituted a "Cadet Associate Membership," whereby engineering pupils in works or college (day or evening students) may be registered for a nominal yearly fee of 5s. It is open to youths of 15 years and over who are still undergoing training, and who, as certified by a principal of a technical college or head of department of an engineering works, are making satisfactory progress in the development of their abilities as engineer pupils. The registration as a Cadet Associate Member of the J.I.E. is for one year only, and renewals can only be accepted when satisfactory progress and development is vouched for by a responsible authority under whom the applicant is serving. The Institution undertakes certain duties in regard to these Cadets, which are set forth in a pamphlet which may be obtained upon application to the Secretary, Junior Institution of Engineers, 39, Victoria Street, Westminster, S.W. 1. The project is commendable, and will, doubtless, meet with the success it deserves. There is little doubt that much valuable *personnel* is now wasted for the lack of a wider organisation such as the Juniors can furnish, and the constitution of the Council is such that the new scheme will be pushed with vigour and enthusiasm in the interests of the profession and of patriotism. Many youths feel that they wish to become engineers, but drift into other professions where they are round pegs in square holes, simply because there is no one from whom they can claim assistance and advice in the furtherance of their desires. Many apprentices, too, remain unacquainted till too late with openings which might lead to their advancement in public or private services either at home or abroad. Managers of engineering shops throughout the country are frequently in need of youths possessing certain elementary qualifications which local conditions cannot provide. Technical instructors, too, desire to become acquainted with openings in works, so that their pupils may gain a good start in life, and not be entirely dependent upon the blind god "chance," which has detrimentally affected the careers of numerous promising youths.

For Government Purposes.—A Scottish correspondent writes:—"Recently five houses in Buckingham Terrace, Edinburgh, were leased for a department of the National Insurance Commission, and alterations, including substitution of electric light fittings for gas, were carried out. Then in a short time the premises were vacated, and had to be put back to their original condition and the electric light fittings removed, at a cost of £3,000. Now, it is stated, the premises have been once more requisitioned for Government purposes, but it is explained that a stricter economy will now be observed."

Royal Mint Report.—The production of Imperial coins, viz., 203 millions, for the year 1915, exceeded by 16 millions that of any previous year, and precluded any but a comparatively small coinage (3 million pieces) being undertaken for Colonial use. Of the Imperial coinage 22 million pieces were gold, 105 million silver, and 76 million bronze. The Deputy Master, Sir Thomas Elliott, states that the silver issues were more than double that of any previous year, and were due to large demands consequent on the withdrawal of gold coin from active circulation. The profit on the year's working was £4,710,000. During the year, Sir Edward Rigg, Superintendent of the Operative Department, reports that 2,130 tons of metal were converted into coinage bars, this figure being approximately double the average of the previous 10 years. In the machinery branch the staff was considerably augmented and engaged on special work undertaken by the Mint. To meet the generally increased demands a 200-kw. Siemens-Belliss generating

set was installed, and the main switchboard extended and re-arranged. The monthly output of the Mint generators averaged 12,269 units, an increase of 2,000 on the figure for 1911. The number of motors in use rose from 106 to 125, their gross H.P. being now 974. The extended use of high-power incandescent lamps has raised the total of such from 8 to 22, and the number of arc and flame lamps has been correspondingly reduced. Incandescent lamps in the official premises show an increase of 32, their total being 1,330, and those in the private residences number 135. In the Inland Revenue Department, 1 copper, 88 nickel, and 55 steel-faced electros were grown in connection with the preparation of adhesive, postcard and embossed plates and dies for postage and other stamps.

The Assayer of the Ottawa Branch Mint, Mr. R. Pearson, refers to experiments made with a view to the increase of the amount of gold electrolytically refined in a given time. Sufficient data were obtained to show that a current density of 7,250 amperes per sq. metre could be used, and a combination, at Ottawa, of the Miller's chlorination process and the electrolytic deposition of gold has been adopted with satisfactory results. Rough gold deposits which are reasonably "clean" (approximately 75 per cent. gold, 20 per cent. silver, and 5 per cent. base) may be raised to 9800–9900 fineness, cast into anodes, and the refining finished by the electrolytic process in 18 hours, all platinum and such metals being recovered from the electrolyte. The slimes are practically eliminated, the electrolyte does not become "foul," and need not be renewed for very long periods.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—

Officer for the Week.—Second Lieut. P. Bowden.

Monday, September 10th.—Technical instruction (searchlight) for No. 3 Company, Right Half Company, at Regency Street. Drill, No. 3 Company, Left Half Company. Signalling Class, 6.30. Recruits' Drill, 6.30.

Tuesday, September 11th.—Physical drill and bayonet fighting.

Wednesday, September 12th.—Drill and elementary bridge construction for No. 1 Company, Right Half Company.

Thursday, September 13th.—Drill and elementary bridge construction for No. 2 Company, Right Half Company. Signalling Class, 6.30. Ambulance Class, 6.30.

Friday, September 14th.—Technical instruction (searchlight) for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Recruits' Drill, 6.30.

Saturday, September 15th.—Commandant's Parade for route march and drill. Parade, Golder's Green Station, 2.45 p.m. Uniform. A and B men are reminded that one route march per month is compulsory. Recruits' drill, 2.30.

Uniform.—A and B men are warned to attend Headquarters on Tuesday, September 11th, to be measured by the regimental tailor for the Service Uniform.

(By order) MACLEOD YEARSLEY.

Power Sources of American Electric Railways.—A recent issue of the *Electric Railway Journal* contained a table showing that of 1,108 electric street railways and interurban lines, 51.3 per cent. generated their own power and the remainder purchased it, also that 70.6 per cent. of the cars are operated on generated power and 29.4 per cent. on purchased power. Many of the companies have power and lighting businesses in addition.

A further table giving a similar classification of railroads operating electrical divisions is as follows:—

Name and division.	Pur- chase power.	Gener- ate power.	Motor cars.	Loco- motives.	Miles.
Balto. and Ohio Belt Division	P	—	—	9	8.4
Boston and Maine, in New Hampshire ...	—	G	37	—	30.72
Boston and Maine, in Mass. ...	P	—	—	5	22
Bush Terminal R.R. ...	P	—	2	3	6
Chicago, Milwaukee, & St. Paul	P	—	—	14	140.6
Erie R.R., Rochester Division	P	—	8	—	40
Grand Trunk, St. Clair Tunnel	—	G	—	6	12
Great Northern Railway, Cascade Tunnel ...	P	—	—	4	10
Long I. R.R. Electric Division	P	—	591	—	217.2
N.Y., N.H., and H., all elec- trified divisions ...	P	G	{ 25 14* }	100	570
N.Y.C. and H.R. Elec. Div....	—	G	{ 192* 19* }	63	254.6
Norfolk Southern R.R. Va. Beach Division ...	—	G	{ 25 17* }	1	47
Norfolk and Western Railway	—	G	12	—	88.8
Penn. R.R., Paoli Division ...	P	—	93	—	96.6
Penn. Tunnel and Terminal Co.	—	G	68	66	95.5
West Jersey and Seashore R.R.	—	G	109	—	150.3

* Trailers.

A Tramway Conundrum.—A driver writes to us that he recently had occasion to use the electric brake (on a car fitted with a B.T.H. controller), and when on the third brake notch, the circuit-breaker tripped out and at the same time the car started again, as if working on the power notch, though the handle was still on the third brake notch. This was repeated several times, and our correspondent (who does not say what type of brake he was using) is anxious to obtain some explanation of the matter.

Prohibited Exports.—The Supplement to the *Board of Trade Journal* of September 6th contains complete lists of articles which, according to the latest information received by the Board of Trade, are prohibited to be exported from Norway, Portugal, Russia, Spain, Sweden and Switzerland. The Supplement also contains a reprint of the United Kingdom Contraband List in its present form.

Improved Motor Ambulances.—Two new types of motor ambulance specially designed to carry serious cases have been designed by the Motor Ambulance Department of the Joint War Committee of the British Red Cross Society.

One of the new vehicles is a single-bed ambulance. The body is light and airy with folding rear doors, and an electric radiant heater is used to maintain the necessary temperature.

The other vehicle is a special two-bed ambulance, built with duplex panels, between which is an insulating material. Heating is provided by electric footwarmers, the current for which is supplied by the regular lighting system on the car, and by pipes through which the whole of the exhaust of the engine can be taken. The car is scientifically ventilated and is lit by electricity.

—*Times*.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—MR. THOS. COPE, permanent way foreman for the Peterborough Electric Traction Co., has been appointed permanent way inspector of the Cape Town Electric Tramways.

General.—MR. R. COLLINS, who is at present on the Belfast staff of the Edison Swan Electric Co., Ltd., has been appointed engineer and manager of the Galway Electric Supply Co., in succession to Mr. L. E. Rayner, who is taking up an appointment in England.

LORD RHONDA has appointed MR. JOHN WARDLE, commercial manager of the Metropolitan Railway, to control the cold air storage and inland transport of food.

LIEUT. JOS. MARTIN, Northumberland Fusiliers, has been promoted to a Captaincy. When the war broke out he was an electrician at Newburn Steel Works, and enlisted as a private in the Fighting Fifth.

The *Times* states that the President of the Board of Trade has granted to SIR E. WYLDBORE SMITH, Director of the Commission Internationale de Ravitaillement, the rank of an Assistant Secretary to the Board of Trade so long as he holds his present appointment.

COUNCILLOR PETER HIGSON has been elected chairman of the Bolton Tramways Committee, in succession to the late Alderman Miles. COUNCILLOR J. R. HORROCKS has been appointed vice-chairman.

Roll of Honour.—CAPTAIN WILLIAM GREGORY TERRY, Lancashire Fusiliers, died of wounds in France on August 27th. He was educated at Shrewsbury School, and afterwards served his apprenticeship with Messrs. Browett, Lindley & Co., Ltd., Patricroft, going through the whole of the departments and completing his course in the drawing office. He afterwards joined the staff of the Salford Corporation electricity works, but after a few years he re-joined Messrs. Browett, Lindley & Co., Ltd., being appointed to their staff as outside representative of their Northern Section. Captain Terry was well known in engineering and colliery circles, and his genial manner won him many friends and respect everywhere.

PRIVATE C. POLLITT, Manchester Regiment, who has died in hospital, aged 47, was formerly employed by Messrs. Charles Macintosh & Co., Ltd., Manchester.

PRIVATE J. KINSEY, of the K.O. Royal Lancaster Regiment, who has been killed in action, was employed at the Blackpool Corporation electricity works.

CORPORAL W. SAVAGE, Lancashire Fusiliers, killed in action, was employed by Messrs. Chas. Macintosh & Co., Ltd., of Manchester.

SECOND LIEUT. FREDERICK VICTOR CLAREMONT, R.G.A., late shift engineer at Islington electricity works, was killed in France on 14th ult.; GUNNER G. PARKER, R.F.A., who was previously employed at the same works as a boiler-house hand, was killed in action on July 14th.

PRIVATE F. WAYWELL, Lancashire Fusiliers, killed in action, was employed by Messrs. Charles Macintosh & Co., Ltd., electric wire and cable manufacturers, Manchester.

CORPORAL G. LOCK, Manchester Regiment, killed in action, was employed by the British Westinghouse Co., Ltd., Trafford Park.

GUNNER R. W. AERSTALL, R.F.A., who is in hospital at Boulogne, after gassing, was employed by Messrs. Bottomley and Frampton, electrical engineers, Blackpool.

LANCE-CORPORAL R. RUTTY, N. Staffs. Regiment, whose death in action is reported, was before the war engaged at Siemens Bros. Dynamo Works at Stafford.

PRIVATE H. THORP, 23rd French Mortar Battery, who has died of wounds, enlisted whilst second in charge of the dispatch department of the Ediswan Works, Ponder's End, where he was engaged for 25 years.

STAFF-SERGEANT A. HARDCASTLE, R.F.A., who was an electrician with Mr. T. Durrant, of Sheffield, has died in India from sunstroke.

PRIVATE S. WALTON, Royal Scots Fusiliers, who has died of wounds, was an employé of Taylor, Tunnicliffe & Co., Hanley.

PRIVATE WM. TODGOOD, Gloucestershire Regiment, who has died in hospital at Bristol, was for three years on the staff at the Bath E.L. Works. In October, 1914, he was taken prisoner of war by the Germans, and some time ago he was repatriated, after enduring great hardship.

RIFLEMAN F. CASWELL, Rifle Brigade, who has fallen in action, was engaged at the Southwark Electricity Works.

PRIVATE E. WALLIS, Queen's Royal West Surrey Regiment, who was with Crompton & Co., Ltd., Chelmsford, has been killed in action.

RIFLEMAN A. FRICKER, London Irish Rifles, who has fallen in action, was with the Telegraph Construction and Maintenance Co.

LIEUT. L. A. WALKER, Army Service Corps, whose death at the Front is announced, was resident engineer at Southgate for the Metropolitan Electric Power Co., Ltd. He had been recommended for the Military Cross.

PRIVATE W. L. BUCKLEY, Royal Welsh Fusiliers, who has been killed in action, was on the staff at the generating station of the Leeds Tramways Department.

SAPPER T. GRANTHAM, of Blackpool, who is in hospital wounded for the fifth time, was an electrician at Blackpool Tower.

SECOND LIEUT. E. B. GREENHOUSE, of Bishops Castle, who has been killed in action, was an engineer and electrician.

PRIVATE J. H. OLIVER, R.E., who has been wounded, was apprenticed with Messrs. Lockart & McNab, electrical engineers, Upper Craigs.

PRIVATE R. C. E. KERR, an employé of the Glasgow Corporation Electricity Department, has died from wounds, aged 35.

CORPORAL H. E. F. GOUGH, R.G.A., employed at the electricity works, Chester Street, Birmingham, has been killed in action.

PRIVATE T. MOODY, an electrical engineer, of Knaresborough, was killed in action on August 10th.

CORPORAL WILLIAM DUDLEY, Manchester Regiment, formerly reported wounded and missing, and now presumed to have been killed, was employed by the Record Electrical Co., of Manchester.

Obituary.—MR. WALTER DAVENPORT.—We regret to note that there passed away at Egham, on August 28th, at the age of 73 years, Mr. Walter Davenport, who will be remembered by many in the electrical trade as the first secretary of the National Electrical Manufacturers' Association. Mr. Davenport, whom we always found a most genial and approachable man, was experienced in trade association matters by reason of his secretaryship of the Mineral Water and Vinegar Brewers' Association, and his experience proved very useful to the electrical industry when it was at the beginning of its organising efforts which preceded the larger operations of the B.E.A.M.A. Later he was, by virtue of his office in the N.E.M.A., prominently identified with electrical exhibitions held at Olympia and Manchester, and with the Electrical Trades Benevolent Institution. In recent years he had not been associated with electrical affairs.

MR. J. G. LORRAIN.—The *Times* "Deaths" column contains a notice of the death of Mr. James Grieve Lorrain, patent agent, of 9, John Street, Adelphi, W.C., which occurred at East Wittering suddenly on August 23rd. In the earlier years of his career he was closely connected with telephone developments in different parts of the British Isles. For considerably more than 30 years he had practised in London as a consulting engineer for electric lighting and telephone work, but more particularly as a patent agent. Mr. Lorrain was a member of the Institution of Electrical Engineers, a member of the Institution of Mechanical Engineers, and a Fellow of the Chartered Institute of Patent Agents. He was also a member of the Council of the Dynamicals. The deceased gentleman was well known in the electrical world, and his unassuming and kindly presence will be much missed in electrical and certain other Masonic circles in London, in which he was a prominent figure.

ALDERMAN GEORGE SALTER.—On August 31st there passed away suddenly, at the age of 61, at Stourbridge, Mr. George Salter, chairman of George Salter & Co., Ltd., steam gauge and spring makers, West Bromwich.

The death has taken place, at the age of 63 years, at Walton-on-the-Naze, of MR. ARCHIBALD WHITE, for many years chief engineer of the *Buccaneer*, owned by the India-Rubber, Gutta-Percha, and Telegraph Works Co., Ltd., Silvertown. He joined the company in 1898. Mr. White had never recovered from privations caused through being shipwrecked off the coast of Madagascar, about three years ago.

NEW COMPANIES REGISTERED.

Clements, Jeakes & Co., Ltd. (148,312).—Private company. Registered August 25th. Capital, £25,000 in 3,000 5 per cent. cum. pref. shares of £5 each and 10,000 ord. shares of £1 each. To take over the business carried on at 51, Great Russell Street, W.C., and at Marklin Street, Drury Lane, W.C., as Clements, Jeakes & Co., and to carry on the business of domestic, electrical, and general engineers, electricians, iron and brass founders, &c. The subscribers are: J. H. Clements, The Cottage, Repton Road, Watford, engineer; G. B. Clements, 26, Regent Square, W.C.1, engineer. The first directors are: J. H. Clements and G. B. Clements. Registered office: 51, Great Russell Street, W.C.

Watercraft Detachable Power Installations, Ltd. (118,345).—Private company. Registered August 29th. Capital, £20,000 in 41 shares (12,500 pref.). Builders of and dealers in engines and power plant for the propulsion of watercraft of all kinds, electrical and general engineers, &c. The subscribers (each with one share) are: T. F. de Saulles, 25, Houghton Road, Birchfield, Birmingham, coal factor's manager; F. W. Huxfield, 18, Frances Road, Handsworth, Birmingham, coal factor's cashier. The first directors are: E. W. Reid, T. H. Coggins, and A. E. Hooke. Solicitors: Shakespeare & Vernons, 83, Colmore Row, Birmingham.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Lancashire Electrical Engineering Co., Ltd.—Memorandum of satisfaction in full on July 27th, 1917, of charge dated March 20th, 1917, securing the sums owing on company's account with Union Bank of Manchester.

A. J. Wakelin, Ltd.—Memorandum of satisfaction in full on August 29th, 1917, of debentures dated May 22nd, 1914, and July 31st, 1915, securing £500, has been filed.

British Thomson-Houston Co., Ltd. (47,982).—Capital, £800,000 in £10 shares (40,000 ord. and 40,000 pref.). Return dated August 13th, 1917. All shares taken up. £725,310 paid; £74,690 considered as paid. Mortgages and charges: £173,495.

Burt, Escaré & Denelle, Ltd.—Capital, £10,000 in 25,000 ord. and 15,000 pref. shares of £1 each. Return dated May 8th, 1917. 19,332 ord. and 10,400 pref. shares taken up. £29,732 paid. Mortgages and charges: £7,500.

Bray, Markham & Reiss, Ltd. (74,871).—Capital, £20,000 in £1 shares. Return dated July 23rd, 1917. 9,650 shares taken up. £8,800 paid; £800 considered as paid. Mortgages and charges: Nil.

Anchor Cable Co., Ltd. (69,073).—Capital, £250,000 in £10 shares. Return dated June 14th, 1917. 6,500 shares taken up. £61,000 paid; £4,000 considered as paid. Mortgages and charges: £50,000.

United Electric Tramways of Monte Video, Ltd. (80,456).—Capital, £1,000,000 in 100,000 pref. and 100,000 ord. shares of £5 each. Return dated July 9th, 1917. All shares taken up. £235,105 paid on 26,221 pref. and 32,800 ord.; £704,895 considered as paid on 73,779 pref. and 67,200 ord. Mortgages and charges: £971,547.

United River Plate Telephone Co., Ltd. (23,654).—Capital, £2,000,000 in £5 shares (324,000 ord., 40,000 pref., and 36,000 unissued). Return dated June 26th. 324,000 ord. and 40,000 pref. shares taken up. £1,740,000 paid on 308,000 ord. and 40,000 pref.; £80,000 considered as paid on 16,000 ord. Mortgages and charges: £300,000.

Western Electric Co., Ltd.—Capital, £500,000 in £5 shares. Return dated May 29th, 1917. 68,805 shares taken up. £25 paid; £325,000 considered as paid. Mortgages and charges: Nil.

Walter's Electrical Manufacturing Co., Ltd. (94,300).—Capital, £13,000 in £1 shares. Return dated July 18th, 1917. 11,250 shares taken up. £1,250 paid; £10,000 considered as paid. Mortgages and charges: Nil.

Westinghouse Metal Filament Lamp Co., Ltd. (89,948).—Capital, £10,000 in £1 shares. Return dated May 10th (filed July 4th), 1917. All shares taken up. £7 paid; £9,993 considered as paid. Mortgages and charges: Nil.

CITY NOTES.

Tyneside Tramways and Tramroads Co.

At the half-yearly meeting, held at Newcastle-on-Tyne on August 28th, Mr. G. E. HENDERSON presided in the absence of Dr. J. T. Merz, the chairman, through ill-health. He said that the traffic receipts had increased by £5,538, compared with the corresponding period of last year, and, as might be expected, the costs also had increased. The amount available for allocation, after paying interest on mortgages, &c., showed an increase of £3,400. The directors proposed to pay a dividend at the rate of 4 per cent., compared with 1½ per cent. for the corresponding half of 1916. They were also increasing the amount placed to reserve and special reserve by £1,061, and the carry forward they had increased by £774. The directors considered the present times abnormal, and any increased receipts which might be due to increased railway fares and reduced railway facilities should be also regarded as abnormal, and not as part of the ordinary progress of the company. They, therefore, thought it better to place a larger sum to the reserve fund. That latter account, with the additions made in the report, would now stand at £27,412, and their investments and loans at £26,134. The traffic receipts were continuing to increase, and for the seven weeks ending August 15th there was an increase of £1,532.

German Companies.

The Elektra A.G., of Dresden, reports for 1916-17 a loss of £6,000, as compared with a deficiency of £5,000 in the previous year. As in 1915-16, the loss for last year is to be met out of the special reserve fund.

The directors of the *Wolfram Lampen A.G., of Augsburg,* report net profits of £7,400 in 1916-17, as compared with £7,100 in the preceding year, and including the balance forward a total of £14,100 and £14,000 in the two years respectively. It is not proposed, however, to make any distribution, but to enter into voluntary liquidation on account of the destruction of the works by fire last May, the impossibility of erecting and equipping a new building, and the withdrawal of customers as a consequence of the recent judgment of the Imperial Court on the matter of the patents relating to wire-filament lamps.

The report of *Brown, Boreri & Co., of Mannheim,* characterises the year 1916-17 as a period of continued great activity and a maximum utilisation of the plant and machinery. The cost of labour and raw materials, however, increased so largely that it was impossible to take them fully into consideration on the acceptance of contracts. After setting aside £44,000 for depreciation, as against £46,000 in 1915-16, the accounts show net profits of £73,000, as contrasted with

£58,000. It is proposed to pay a dividend of 12 per cent., this rate comparing with 10 per cent., 5 per cent., and 5 per cent. in the three preceding years respectively.

The Continentale Ges. für Elektrische Unternehmungen, of Nuremberg, which is a financial organisation of the Schuckert group, reports that the many years of the company's activity in the construction and working of electricity supply works and tramways in Italy was brought to a standstill in the year ended with March 31st, 1917. It was possible to realise these investments on suitable terms, and the money thereby realised was applied partly to the repayment of credits granted by the Schuckert Co. and partly to the purchase of German loans. The entrance of Rumania into the war had cut off connections with the Jassy electricity works, and no information was available as to the situation of that undertaking. The traffic on the secondary railways and tramways in which the company is interested was more active than in the preceding year, but the working expenses experienced a large increase, and the financial results were again unfavourable. Including the balance brought forward, the net profits in 1916-17 are returned at £44,000, as in the previous year, and the dividend is at the rate of 2½ per cent. on capital of £1,556,000, being the same as in 1915-16.

The Deutsch Sudamerikanische Telegraphen Gesellschaft, of Cologne, states that since the issue of the report for 1915 no alterations in the condition of the company's cables, so far as could be seen from the results of tests available to the company, had taken place, and working was at a standstill. It could not be foreseen what the consequences would be of the rupture of diplomatic relations between Brazil and Liberia in regard to the stations at Pernambuco and Monrovia and the other property there. The receipts in 1916 amounted to £205,000, as compared with £182,000 in the preceding year, and the net profits are returned at £54,000, as against £41,000. A dividend has been declared at the rate of 5 per cent. as compared with 6 per cent. in 1915, on ordinary share capital of £625,000. The report also mentions that the accounts for 1916 of the *Compania Telegrafico-Telefonica del Plata* had not reached the company, but as the financial position of this Argentine company led to the assumption that it would not be able to pay any dividend for last year, the Cologne company had set aside £19,000 as reserve for its investment in that company.

Russian Companies.

The Petrograd Electric Lighting Co. of 1886 records net profits of £809,000 for 1916, as contrasted with £680,000 in the previous year. Apart from the dividend of 10 per cent. on the preference capital, the ordinary shares are to receive 7 per cent., but the distribution of the profits, as a year ago, is deferred to a future occasion.

The Russian A.E.G. is reported to have earned gross profits amounting to £625,000 in 1916, and net profits of £280,000, as compared with £223,000 in the previous year. It is proposed to pay a dividend of 10 per cent. on ordinary share capital of £1,200,000, as in 1915, the new shares for £1,200,000 not participating in the distribution for 1916. The undertaking is being continued as a Russian concern by a new company under the title of the *General Electricity Co.*, with a capital of £2,400,000.

The Russian Siemens & Halske Co. reports gross profits of £336,000 for 1916, of which £125,000 has been devoted to depreciation, £16,000 placed to the reserve fund, and £91,000 applied to the payment of taxes on war profits. The balance permits of the payment of a dividend of 12½ per cent. on the old shares and 7½ per cent. on the new shares, the total share capital being £700,000. The company's undertaking and that of the *Russian Siemens-Schuckert Works* are now being taken over by a Russian company with a share capital of £2,500,000.

City of London Electric Lighting Co., Ltd.—Dividends announced on account of the distribution for the year ending December 31st, 1917:—On the preference shares 6s. per share, on the ordinary shares 6s. per share, both subject to the deduction of income-tax.

Brazilian Traction, Light & Power Co., Ltd.—Quarterly dividend of 1½ per cent. on the fully-paid cumulative preference shares.

Clyde Valley Electrical Power, Ltd.—Interim dividend, 1½ per cent. actual on the ordinary shares, free of tax.

Newcastle-upon-Tyne Electric Supply Co.—An interim dividend of 2½ per cent. on the ordinary shares, less tax, is announced.

London Electric Supply Corporation, Ltd.—The directors, for reasons entirely attributable to the war, have deemed it advisable not to distribute a dividend on the preference shares, but to carry forward the profit earned in the half-year ended June 30th last.—*Financial Times.*

Davis & Timmins, Ltd.—Interim dividend, 6 per cent. per annum, free of income-tax, on ordinary shares for the half-year.

Madras Electric Tramways, Ltd.—Interim dividend on ordinary shares for the half-year ended June 30th, 8 per cent. per annum.

Canadian General Electric Co., Ltd.—Quarterly dividend of 2 per cent. for the three months to September 30th on the common stock, and a half-yearly dividend of 3½ per cent. for six months (at the rate of 7 per cent. per annum) on the preference stock.

Reduction of Capital.—*Pollock & Macnab.*—A petition for confirming a resolution reducing the capital from £60,000 to £50,000 has been presented to the Court.

Marconi International Marine Communication Co., Ltd.—The directors have been offering to the shareholders 250,000 new shares of £1 each at the price of £1 15s. per share.

STOCKS AND SHARES.

TUESDAY EVENING.

THERE is little diminution of the strength of markets as a whole, and the news from Riga failed to depress materially any Stock Exchange prices, with the exception of those immediately concerned. A considerable amount of buying has taken place amongst the industrial groups; and, as an instance of the way in which prices respond to any little attention which may be drawn to them, the case of Edison Swan shares is appropriate. The consideration advanced that, having regard to the splitting of the shares which will take place before the end of the year, last week's quotation of 19s. was tempting to the buyer, evidently attracted a good deal of notice, because the price ran up to 23s. in a couple of days, reacting as the profit-takers came in to 21s. 6d. Other members of the manufacturing group are also being inquired for, and the £5 shares in the Edison Company have themselves risen from 30s. a fortnight ago to 35s. now. As a speculation, they are probably worth buying to-day, though the qualification requires emphasis.

Substantial recoveries have occurred amongst the stocks in the Underground Railway group. Revision of the fares came into force on the tube and bus systems last Saturday, and this is held to constitute a strong bull point in favour of Metropolitans, Districts, and, of course, the issues of the Underground Electric Railways Company itself. The Income Bonds of the last-named have risen to 84½, *ex* the £2 net dividend deducted on Monday. The £10 shares are better at 35s., and the shilling shares have come in for a little notice on a slightly improved basis. Metropolitans have risen 1½ to 24½, Districts the same amount to 16½. They have the market to themselves, these Undergrounds, because the rest of the Home Railway market is dull, heavy, and listless, thanks to the incessant demands made by this or the other section of railway men.

Further progress has been made in the upward direction by electric lighting shares. Interim dividends are now being declared, and two or three prices have advanced notably, though the rest are left unchanged. Buyers, however, find that their orders are extremely difficult to fill, and that their stockbrokers report shortage of shares in nearly all the group. It is being assumed that the electric lighting companies have now got down to a level of dividend which is likely to prove bedrock, so far as the war-time is concerned; while, afterwards, there is more than a fair prospect of the pre-war standard being attained.

There is a feeling—it can scarcely be described as a rumour—in the air that closer unity will yet be established between the various electric supply undertakers, and that any move in this direction is bound to have the effect of benefiting the companies through the saving of expenditure which would inevitably follow. This idea does not confine itself entirely to London companies. Those in the provinces are also expected to be affected. As we have just remarked, however, it is no more than an impression at present, although it adds to the strength of the market as a whole.

The cable market is good, with improvements in Eastern Telegraph ordinary stock and two or three of the others. A very fair volume of business is being transacted here, but, as before, shares are in short supply. Something of a feature is the firmness of International Marconi Marine shares, which have risen sharply on the company's announcement of a new issue of shares at a price which will give existing holders a profit of about 17s. 6d. per new share.

Proprietors are invited to apply at 35s. for as many shares as they like; and as it is uncertain what proportion they will be allotted, the Stock Exchange has been unable to fix any definite price as the value of the rights, although Marines are quoted this week *ex* rights. After touching 2½, the price reacted to 2½. The shares in the parent company are practically unchanged at 3½, most of the interest centring upon Marines for the time being. Canadians and Americans remain at 2s. 6d. and 16s. 3d. respectively.

Mexicans move in somewhat bewildering fashion. After a bout of most unusual strength, the markets concerned in Mexico have halted; and in several cases holders of the stocks and bonds have taken advantage of the big rise in prices in order to realise their securities. Mexico Trams got up to 10, but reacted to 3½, and Mexican Light and Power Common from 30 came back to 24. Yet the Preferred shares in the latter company have moved up another 3 points, and the bonds are steady. Brazilian Tractions further eased off to 47, another drop of a point, though the Preferred improved to 93.

The Anglo-Argentine Tramway group is very firm. Proposals are now before the Argentine Government with a view to enabling the railway companies to raise their fares; and it is more than half expected that, if these are allowed, the Tramway Company will also follow suit. Rio Tramway and San Paulo Tramway Bonds are both better.

Amongst miscellaneous shares, British Aluminium Ordinary and Edison Swan's have divided most of the attention. The former jumped to 33s. 3d., while Edisons, as mentioned before, rose from 19s. to 23s. before reacting to 21s. 6d. The £5 fully-paid shares at 35s. are 5s. higher, following upon their rise of 2s. 6d. last week. No change has occurred in the Debenture stocks. British Insulated at 14 have another 10s. to their credit. India-Rubbers and Telegraph Constructions are both strong. Babcock & Wilcox have been wanted in the North of England up to 63s. 6d., and the price in London reflects this demand.

There is no particular change in Callenders. Henleys have recovered the dividend of 5s. It is thought that British Westinghouse Preference at 2½ possess more than a sporting chance of improvement. They are 1½ per cent. shares, and received dividends in the last two years of 7½ per cent. per annum, so that the yield at the present price is about 5½ per cent. on the money. It may be only the optimism permeating the industrial market as a whole which points the anticipation of a rise in Westinghouse Preference, but the shares will be interesting to watch, at all events, for the next few weeks.

The Rubber Market is good, thanks to a rise in the raw stuff to 2s. 9½d. per lb. An explosive rise in most of the powder companies' shares is another of the features in the Industrial Market; and just lately some of the Mining sections have begun to wake up, the improvements including a good many of the shares in the companies of the base metal group.

V.B. CABLE BREAKDOWNS IN THE TROPICS.

By C. J. BEAVER, M.I.E.E.

THE article on this subject in the ELECTRICAL REVIEW of August 24th, 1917, by Mr. D. M. W. Hutchison, Chief Electrical Inspector of Mines in the F.M.S., does not constitute so serious an indictment on V.B. cables under tropical conditions as might at first sight appear. From the opening paragraph it might be inferred that the cause of failure under tropical conditions had not been investigated by the cable makers, and that the latter are content to account for it by assuming that the conductors have been overloaded, and that the resultant overheating has allowed decentralisation to occur.

This entirely ignores a recent detailed account of an investigation of the subject in the Tropics given in an I.E.E. paper on "Cables" by the present writer (see ELECTRICAL REVIEW, December 4th and 11th, 1914, pages 770 and 802, and *Journal I.E.E.*, Vol. LIII, 1914, page 74 *et seq.*). It will be presumed in the following notes that readers sufficiently interested will be more or less cognisant of these references, in which it was conclusively shown that such trouble as has occurred in V.B. insulated cables in the Tropics has not been due—as might appear from Mr. Hutchison's references to overload, sun temperature, &c.—solely to tropical temperature conditions. Heat was found by the present writer to be only one of the factors in the case, and one which would not alone produce the trouble. In the investigation above referred to, the factors determined by very comprehensive survey and diagnosis of the results of minute examination of cables and their surroundings, confirmed by further investigation on the spot (comprising both positive and negative evidence), and subsequently corroborated by experimental reproduction of the effects, were heat, moisture, leakage current and time.

The first stage leading to failure is usually a physical change whereby the V.B. is softened. It was previously known to the writer that such softening might be of a character distinct from that which occurs quite locally in the vicinity of a fault on a negative V.B. cable, commonly known to be due to a saponification effect on the V.B. following on the local production of alkaline substances by the electrolytic action of the fault current. Its occurrence was also known to be distinct, not being confined to negative cables, but arising on positive, negative, and neutral cables indiscriminately. It also occurred on cables carrying alternating current.

Softening due to heat and moisture under exaggerated temperature conditions was known by the manufacturer to occur in the process of vulcanisation of the bitumen, but being accountable for by local retardation of vulcanisation due to the presence of moisture, its real significance was not appreciated until these factors were determined by the investigation referred to. This type of softening (in the absence of alkaline material) was shown to be considerably facilitated by the action of current from a source external to the part acted upon, moisture being an essential factor in forming paths for such current.

When the V.B. becomes sufficiently softened to become displaced and to allow leakage from the affected part, the effect of current tends to predominate, and softening proceeds rapidly, although the defect may not, and usually does not, for reasons which will be considered later, constitute a fault which will definitely declare itself.

Another feature, to which due significance had not previously been attached, was that the softening and consequent breakdown effects were local and not general.

The writer had, prior to his investigation in the Tropics, frequently asked for information on this point, and invariably received the answer that it was general.

The misleading character of this reply is doubtless due to the fact that little is seen of the cables in the ordinary course by those in charge of them, except at parts where trouble occurs; and in such cases the urgency of affairs connected with supply is such that other questions are considerably subordinated thereto. Even if a sample and a fairly lucid description is sent home, it is not only difficult

to correctly diagnose the original cause of breakdown, owing to the impossibility of distinguishing symptoms of effect from those relating to cause, but the question of the condition of surroundings and adjacent parts has practically no light shed upon it. Not only the microscope, but the field glass is necessary when fundamental questions are involved.

Mr. Hutchison says, when describing the character of certain faults in a V.B. distribution network, "the bitumen sheathing for several feet on each side of the fault was soft and sticky," but he does not mention the important point as to whether this state continued or ceased. It is clear that if it did cease, as in the writer's experience it frequently would, Mr. Hutchison's opinion that "V.B. cables are quite unsuitable for tropical countries" only applies to part of the cable. This variation leads to the obvious suggestion that extraneous and not inherent causes are responsible for the effects.

The writer has frequently seen normal and considerably deteriorated cables side by side in the same bitumen-filled trough, as well as transitions from one stage to another within a few inches in the same cable.

Some remarkable cases of the latter are described in the paper above referred to, where in the case of armoured service cables laid direct in the ground, a sharp line of demarcation existed between parts above and parts under the ground, the former being quite normal and the latter appreciably affected. Again, in feeder pillar cables, variations in the physical state of the V.B. coincided with local leakage circuits, due to damage of the insulation where the cables entered the pillars, and defective trims at terminal lugs. These coincidental variations were not accidental occurrences, the number of instances checked for confirmation, and the consistent character of the results of examination putting this beyond doubt.

As temperatures above ground were in these cases considerably in excess of the temperatures below ground, and as cables which had been stored for years showed no evidence of deterioration, it was quite clear that tropical conditions, *per se*, were not the cause of trouble.

To summarise the matter, the conclusions above referred to were drawn from such a mass of evidence as to render them practically incontrovertible.

Apart from the experimental reproduction of the effects which was subsequently successfully carried out, a number of opportunities have been taken of checking the conclusions in various cases which have since been submitted for the writer's examination.

Such additional evidence as has been gained has been almost invariably confirmatory in character. For instance, with regard to the factor of current, confirmation of its passage through apparently solid masses of trough filling bitumen has been afforded by examination of globules of water enclosed in such masses. They have been found in some cases strongly alkaline and in others distinctly acid, according to the polarity of the cable to which they were in close proximity, though not in contact. It may be added that in these cases the cause of the leakage was damage due to subsidence of ground.

In most cases the value of the leakage current concerned is probably of a minute order, and, from this point of view, non-metallic sheathed cables are certainly at a disadvantage, because, in the first place, insulation resistance tests give very indefinite results, which do not indicate the intrinsic soundness of the dielectric proper (this being usually in series with other insulating materials, such as trough-filling bitumen, &c.), and, secondly, for the same reason, faults do not readily breakdown on account of the high resistance of their path to earth. This maintenance difficulty is, in the writer's opinion, the key of the whole trouble so far as distribution networks of V.B. cables are concerned. The effects of the factor of current are cumulative—local leakage circuits producing softening and, in turn, other leakage circuits, which go on reacting with each other—so that a considerable amount of deterioration occurs before any electrical indication of it is available. It must be remembered, although it is frequently overlooked, that in such systems it is only the balance of fault current which returns *via* earth to the station, and therefore ideas as to the total amount of leakage in a network may be very

erroneous. It will therefore be seen that, so far as distribution networks are concerned, the whole matter turns on efficient installation and rigid and minutely-organised maintenance.

With regard to the three-core solid V.B. double-wire armoured cables supplying the pumps in a tin mine in the F.M.S. referred to by Mr. Hutchison, the writer has seen samples which probably came from this installation.

The general description of the installation bears a remarkable similarity, although the description of the mechanism of failure does not correspond to the description which Mr. Hutchison gives of "the cores coming together and short-circuiting." This, however, may have been assumption on his part.

In the shaft and adit samples examined by the writer neither of the faults were between phases. In the former, the cores had locally—at a bend where the cable turned from the vertical to the horizontal at the shaft bottom—approached the armour at the inner radials of the bend. The original thickness of dielectric between the cores was, however, fully maintained throughout the faulty part, and, moreover, they returned *en masse* to their central position within 2 ft. to 3 ft. of the fault. The atmospheric conditions were said to be steamy, or foggy with moisture, at a temperature of 110° F. These conditions presumably allowed, or produced, sufficient weakening of the exterior part of the V.B. to allow the internal mechanical stress due to the bend to overcome its resistance, but it is significant that the inner part between cores, which was presumably hotter because of the current carried by the conductors, did not yield. There was some softening of the outer part of the V.B.—probably commenced by the two factors of heat and moisture, and subsequently accentuated by leakage current—but the inner parts were quite normal. Generally, therefore, there was nothing mysterious about the failure, nor anything at variance with previous knowledge.

In the case of the adit cable, the fault appeared to be primarily due to a mechanical trouble. So far from the cores coming together, they had uniformly splayed out until they locally approached the armour. This being quite opposed to the normal tendency, it seemed clear that a mechanical stress had been set up during installation which tended to untwist the cores, and the writer's conclusion was that a certain amount of bending or kinking had occurred when the cable was being carried into the adit by the Chinese coolies, and that the mechanical stress referred to was the result of efforts to straighten the cable.

It may be added that instances similar to this are not unknown at home when cables are carried in-bye in coal mines on the shoulders of labourers.

With regard to a remedy for the non-mechanical causes of breakdown, the investigation described in the paper above referred to, the subsequent reproduction of the effects, and the study of the chemical and physical aspects of the subject led to the conclusion that the primary stage—the softening process—might be averted by the physico-chemical expedient of incorporating with the V.B. some colloidal substance, incapable of decomposition by hydrolytic action, and exerting a maximum protective effect when present in small proportion.

Experiments in this direction ultimately showed that high-grade vulcanised rubber could be so treated that it would fulfil these requirements,* and that a very small proportion of the admixture afforded a surprising degree of protection. In fact, the combination had properties not possessed by its components.

It has been shown above that what appears to the casual observer to be a combination of mechanical weakness (permitting decentralisation) and chemical change (softening) is primary and not ultimate in character, and having provided against this primary or fundamental source of the trouble, the mechanical aspect of the matter may fairly safely be left to take care of itself under normal conditions of laying or fixing.

It may be, as Mr. Hutchison suggests, that paper lead-covered cables would give good results in the hands of trained Oriental jointers, but consulting engineers at home do not yet appear to be convinced that the instruction im-

parted by European jointers, in the East has sufficiently leavened the lump.

The relative carrying capacities of paper lead-covered and V.B. insulated cables are not so widely different as is often supposed; in fact, under some conditions of installation there is no difference in this respect. The non-hygroscopic character of V.B. which prevents a local damage causing the ruin of a long length of cable, will always constitute a strong argument in its favour as compared with hygroscopic insulating material—such as paper and varnished cambric. The fact that these latter materials are dependent for the preservation of their insulating properties on the provision of a lead covering and on its maintenance intact, is a particular disadvantage in mining installations, where the fixing conditions are invariably awkward and the risks of damage considerable.

It is on account of these considerations that the solid type of wire-armoured V.B. cable has had such a vogue in mining work at home.

THE MANUFACTURE OF NITRATE OF AMMONIA BY ELECTRIC POWER AT COKE OVEN PLANTS.

By E. KILBURN SCOTT, A.M.I.C.E., M.I.E.E.

(Abstract of paper read before the COKE OVEN MANAGERS' ASSOCIATION.)

WHENEVER reference is made in papers or articles to by-products of coal, the utilisation of the ammonia is always assumed to be as sulphate of ammonia.

In order to make this, compound sulphuric acid has to be purchased at prices which are fixed by the acid associations, and, further, it has often to be carried to considerable distances, which adds to the expense. In peace time there is usually plenty of acid, but since the war it has been very scarce.

This paper proposes to show that manufacturers of coke can easily turn their ammonia by-product into nitrate by means of acid of their own manufacture; also that by making their own acid they become entirely independent of the acid associations, which have for so long controlled the supplies in this country.

The nitric acid required for nitrate of ammonia may be very dilute—of, say, 25 per cent. to 33 per cent. strength—and it is easily and cheaply made from the air by electric power.

When ammonia is obtained as a by-product of the distillation of coal, the cost may be, as in the case of most by-products, only a little above the interest charge on the recovery plant plus the cost of operating the same.

A battery of 50 regenerative ovens of, say, medium size Coppée type, will coke 360 tons of coal per day. Taking coal of average quality, containing 10,000 cu. ft. of gas per ton, and assuming 50 per cent. as being surplus gas, there would be 1,800,000 cu. ft. of surplus gas per day. Large gas engines working on such gas have been found to use about 21 cu. ft. per brake-horse-power per hour, so this quantity of surplus gas should develop about 3,500 h.p., which, with modern electric generators, is equivalent to about 2,500 kw.

Power may also be obtained from waste-heat ovens by using the steam in high-pressure steam turbines.

A battery of 50 waste-heat ovens of, say, medium size Coppée type, will furnish enough waste heat to raise about 350 tons of steam per day in high-pressure boilers. If the steam is superheated, and used in modern steam turbines, a consumption of about 11 lb. of steam per horse-power per hour is attainable, and the power should therefore be about 3,000 h.p., which, with modern electric generators, is equivalent to about 2,000 kw.

I understand that beehive ovens are kept in use, partly because the coke is supposed to be more suitable for making crucible steel than any other kind. This appears to be a fallacy, but in any case electric steel furnaces which do not require any coke are rapidly coming into use.

I propose to give figures for a power plant capable of generating 1,000 kw. continuously, and an electrochemical factory to utilise that amount of energy. Readers must remember, however, that the larger the plant the lower the first cost per kw. installed.

The following is the approximate cost of power-house plant for utilising coke-oven gas in direct coupled gas engines:—

Three 500-kw. vertical type gas engines direct coupled to three-phase alternators, complete with two motor-driven circulating water pumps for the engine jackets, compressed air starting equipment, also piping and valves. Gas mains from ovens to purifiers and thence to gas engines, also the purifiers to rid gas of sulphur before passing it to the gas

* Patent No. 9,554/1914.

engines, £28,000. Under normal conditions this should be sufficient to cover buildings, foundations, and all incidental expenditure.

The following is the approximate cost of power-house plant for utilising waste heat to raise steam for turbines:—

Three 500-kw. steam turbo-alternators of Westinghouse or other good type, each complete with condenser, motor-driven extraction pump, valves and fittings, £20,000; also steam-raising equipment for above, consisting of boilers and super-heaters, economiser, steel chimney, feed pump, steam and water piping, and gas mains from ovens to boilers, £9,000; total, £29,000.

It will be seen that for the size of power-house, the price is about the same for each kind of plant. For larger sizes the cost of a steam plant is lower than a gas-engine plant, also the limiting size of a gas-engine unit is about 1,000 kw. Steam turbine units can be built for practically any output, and the larger they are the better they work, and the lower the steam consumption.

Gas engines give high thermal efficiency, but unless precautions are taken they do not work well with coke-oven gas, because of the snappy action due to high percentage hydrogen.

Leaving a fair margin of profit, electrical energy ought to be supplied from such a power-house at ½d. per unit. At this figure, 1,000 kw. for 8,000 hours a year would bring a return of £4,166.

From this must be deducted the standing charges, labour, and stores, and also any figure that the coke-oven proprietor feels justified in charging for the gas or waste heat. As he is selling to himself, it is merely a matter of book-keeping, and profit can be shown in steps or on the finished product only.

The plant required to fix atmospheric nitrogen as nitric acid partly consists of electrical apparatus and partly of chemical, the latter being by far the largest and most expensive part, and taking up most space.

The plant consists of:—Electric furnaces and boilers; switchgear and instruments; fans for air supply and circulation of gases; apparatus for cooling and oxidation of the gases; &c. Also the acid and alkali absorption towers or chambers, complete with acid elevators or *montejus* and distributors, &c.; reservoirs and mixing tanks; crystallising and drying plant, &c.

The furnace is that which I have specially developed for the purpose. It differs from those in use abroad in that it is a self-contained three-phase unit, and as such it has various advantages.

The recognised method of measuring the yield of the furnace is to find the output of dilute nitric acid which it gives in a given time for a given amount of electric energy. The acid is resolved into the equivalent amount of pure nitric acid of 100 per cent. strength.

Usual yields for single-phase furnaces are about 50 grammes per kw.-hour with 60 as a maximum. Careful tests carried out over a considerable period with my three-phase furnace have shown considerably higher yields.

To make nitrogen peroxide gas into acid, it has to be brought into contact with water, and a convenient way of doing this is to have several absorption towers filled with acid-proof tiles arranged so that the liquor and the gases pass in contraflow direction. The acid is drawn off at 25 to 33 per cent. strength, which is strong enough for making ammonium and calcium nitrates.

At the end of the acid-absorption towers there is a further tower also filled with tiles, down which caustic soda trickles. This has a stronger affinity for the gas than has water, and the small amount which passes over from the acid towers is thus quickly absorbed, and forms a mixture of sodium nitrate-nitrite, which is used in the aniline dye manufacture.

Another form of absorption tower than can be employed gives acid up to 50 per cent. strength.

The manufacture of nitrate of ammonia is carried out by running the dilute nitric acid from the absorption plant into a closed iron tank containing ammonia solution, in which the ammonia is at about 25 per cent. strength. Acid is slowly added to a large volume of liquor, and an agitator mixes them together, the heat of combination being carried off by cooling coils as well as by circulation of air.

The addition of acid continues until nearly all the ammonia is taken up, leaving a slightly alkaline reaction.

The ammonium nitrate solution is then run through a filter into vacuum pans, where evaporation is effected by steam coils at a pressure of 20 mm. of mercury.

When nearly all the water has been evaporated the solution passes into long troughs slightly inclined, and subjected to a rocking motion. The nitrate forms into small crystals with no enclosure of liquor, and after the crystals have been dried in a hydro-extractor they are placed in bags or barrels ready for market. The nitrate is absolutely pure.

We will assume that the electrochemical plant is of such size as to utilise 1,000 kw., the round figure above mentioned, while the power house will supply continuously.

For the electrochemical plant £8 per kw. is a fair price, so the total is £8,000.

The price of electrical energy is assumed at ½d. per unit, which is fair, because electrochemical factories in this country have been supplied with electrical energy at under that figure for many years.

The number of working hours in a year—namely, 8,000—

is convenient because it leaves a balance of 700 hours for overhaul time, &c., and thus less spare plant is required. It also allows for intermittent running off the peak in winter, if found necessary.

Depreciation on the electro-chemical plant may be taken at 10 per cent., this being sufficient to pay for a new plant in about seven years. A large proportion of the capital cost is required for absorption plant, which is of robust construction, like a chimney, the depreciation for which is usually taken at 2½ per cent.

The yield of acid is reckoned at 1½ tons of 33 per cent. nitric acid per kw.-year—that is to say, 1,500 tons from a plant utilising 1,000 kw. This is based on a yield of 66 grammes of concentrated acid, or 200 grammes of 33 per cent. acid per kw.-hour. As a matter of fact, greater yields are obtainable, but the above figure is sufficient for the purpose.

Assuming the electrochemical plant to cost £8,000, and to utilise 1,000 kw. for 8,000 hours per annum at ½d. per unit, the expenses are:—

Electrical energy	£4,166
Depreciation, 10 per cent. on £8,000	800
Salaries, wages, stores, royalty, &c.	1,790
		£6,756

This, for an output of 1,500 tons, gives £4½ per ton of 33 per cent. nitric acid, or the equivalent rate for pure acid is £13 10s.

For a plant to utilise 10 times the amount of energy, or 10,000 kw., the cost should be well under £4, even taking the above figures for the yield.

The amount of ammonium nitrate that can be made by such a plant is 135 tons of pure ammonia plus 1,500 tons of 33 per cent. nitric acid, giving 635 tons of pure ammonium nitrate.

As to the value of ammonia from the coke-oven gas, I intend to take the figure of £30 a ton, or 3½d. a lb. The cost per ton may now be set out as follows:—

1,500 tons of 33 per cent. nitric acid at £4½	£6,750
125 tons of pure ammonia at £30	3,750
		£10,500

As this produces 635 tons of ammonium nitrate, the cost is £16½ per ton.

In addition to ammonium nitrate, there is also the sodium nitrate-nitrite. This may be assumed at one-tenth of a ton per kw.-year, and it is readily saleable. It should be worth £1,500 a year.

There is a margin between the above calculated cost and the normal selling price of 100 per cent. I leave it to readers to whittle this down as they think fit to allow for inefficiency of reaction and other contingencies. When that is done there will still be a large margin.

Before the war, nitrate of ammonia made by the electrical process in Norway was sold in large quantities at £28 to £30 a ton. Properly speaking, there is no quotation now, because all the make is taken by the Government for explosives. Its minimum price may, however, be fairly taken at double the above figure.

What will happen after the war we cannot tell, but one thing is certain—namely, that the price per unit of contained nitrogen will be higher for nitrate of ammonia than any other nitrogen compound. This has always been so, because the combined nitrogen is 35 per cent.

Usual percentages of combined nitrogen are given in the following table:—

Name.	How obtained.	Usual percent. of nitrogen
Sodium nitrate	From Chile	15½
Sulphate of ammonia	By-product of coal	18
Calcium nitrate	Made by electric power	18
Calcium cyanamide		13
Nitrate of ammonia		35

As a means of transporting combined nitrogen from one part of the world to another, nitrate of ammonia is better than any other medium, so it is likely always to hold the field in the export market.

Nitrate of ammonia is the principal ingredient of most safety mining explosives, the word "safety" being a relative term expressing the fact that they are safer than dynamite, &c.

The British and certain other Governments have passed regulations insisting on only safety or permitted explosives being used in mines. The more this idea extends the more nitrate of ammonia will be required.

The present demand for nitrate of ammonia for making up burster charges for shells is tremendous, and it is no exaggeration to say that we are now using more in a week than before the war we used in two years.

Under the trade name of "ammonal" (a mining explosive used before the war), nitrate of ammonia mixed with powdered aluminium and certain other ingredients is used as the burster charge for hand and rifle grenades.

Explosives are likely to be used to a much greater extent after the war than was the case before, because soldiers who have been accustomed to handling them will have no hesitation in using explosives for agriculture when they go back to the land.

For breaking up soil and making holes for fruit trees explosives are already much used, because the soil is thoroughly loosened, and this enables the roots to grow easily, and moisture to get to them. For breaking up the underlying "hard-pan" of soils of hot countries, explosives are also very useful.

As the safest form of explosives nitrate of ammonia should be much used for this work; indeed, it is likely that Government regulations similar to those for mines may be drafted for agriculture.

I believe that after the war nitrate of ammonia will come into use as a fertiliser. The expert gardeners of France and Belgium have used it for intensive cultivation for some years. Nitrate of ammonia is an all-round fertiliser. Also, it has the advantage that when it gives up its nitrogen to plants only the constituents of water are left behind.

The principal objection to nitrate of ammonia is that it is deliquescent, but this is likely to be overcome, and careful experiments to this end are now being conducted.

Before the war practically all the nitrate of ammonia used in this country for making safety explosives for mining, &c., was imported from Norway, which, considering the necessity for nitrate of ammonia, is another instance of the absurdity of allowing foreigners to control businesses important to the nation.

Before the war Germany was the largest purchaser of Chile nitrate, taking twice as much as the next consumer, the United States, and over six times as much as this country. Now Germany does not require any Chilean product, because immense plants to make nitrates from the air have been established.

It will easily be seen that by making nitrates from air the Germans are at a great economic advantage, for our complete dependence on Chile nitrate means we have to pay large sums for the nitrate and for transport, insurance, &c. Also, there is part of the immense national charge for protecting the sea routes by which we get it here. Large sums are also required for the pyrites, sulphur, and for the plants to manufacture sulphuric acid with which to treat the nitrate.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

SWITZERLAND.—A Federal Decree, dated June 30th, consolidates and extends the prohibitions of export formerly in force. The effect of the measure is to prohibit the exportation as from July 7th of goods of all kinds with the exception of those specified; export licences may, however, be granted by the Department of Public Economy in so far as national interests permit. Among the goods excepted are china insulators, dynamo-electric machines, and electrical transformers, induction coils, high-tension coils for dynamos, and electric arc lamps.

Another Decree contains provisions respecting the particulars which are required to be entered in import and export declarations, the collection of the statistical tax—*vide* the ELECTRICAL REVIEW of May 18th—and the exemption from this tax accorded to certain classes of traffic, &c., &c. The text of the Decree may be consulted at the Department of Commercial Intelligence, 73, Basinghall Street, E.C. 2.

TUNIS.—By a Beylical Decree, dated May 16th, lead and lead ores exported to foreign countries are subject to an export duty of 2 per cent. of the value f.o.b. port of shipment.

FRENCH WEST AFRICA.—For the purpose of assessing export duty, the valuation of rubber exported from April 1st to October 1st has been fixed at 500 francs per 100 kilograms, for shipments from Senegal, French Guinea, Ivory Coast, and Dahomey. Export duty is leviable at the rate of 7 per cent. on the valuation.

BRITISH INDIA.—An official announcement has been issued by the Department of Commerce and Industry that all qualities and sizes of ruby block mica, both of Government and trade descriptions, may be shipped freely to London without any restriction whatever. The British Government, however, reserve the right to requisition any consignments on arrival if required for military munitions.

EAST AFRICA AND UGANDA PROTECTORATES.—The Customs Departments of East Africa and Uganda have been amalgamated, and are now under the control of the Chief of Customs of East Africa. The East Africa Customs Regulations will apply generally to the amalgamated Department. Road and wharfage dues have been abolished by the Government of Uganda.

JAMAICA.—The increased import duties imposed last year on certain goods—see ELECTRICAL REVIEW of August 18th, 1916—have been re-imposed for the year ending March 31st, 1918.

UNITED STATES OF AMERICA.—The War Revenue Bill, as passed by the House of Representatives, provides for an additional Customs duty of 10 per cent. *ad val.* on goods which are dutiable under the United States Tariff Act, and

a duty of 10 per cent. *ad val.* on goods which are free of duty under that Act. The measure has yet to be passed by the Senate, who, it is understood, are proposing various amendments.

NETHERLANDS.—Under a recent Customs decision, sheets of mica, even if cut in special sizes, will be admitted free of duty.

GRENADA.—The importation by steamer of electrical apparatus, among other goods, is prohibited by Proclamation, as from May 25th.

THE RUSSIAN GOVERNMENT AND ELECTRICAL INDUSTRY.

It is of great interest to learn from a Russian Government organ that while our Ally is groping its way along the dangerous pathway that leads to Freedom, trying to bring organisation out of revolutionary chaos, there is proceeding in the background a development which in principle is of the utmost importance industrially.

It has been resolved that the Russian Government shall itself participate in a number of large electrical share companies. In April last there were approved the statutes of the General Electrical Co. with a capital of 24,000,000 roubles; and in the following month the statutes of the Russian Siemens Co. (capital 25,000,000 roubles) were also approved. The founder of both companies was the Treasury itself, in the person of the Ministry of Trade and Industry, which took 35 per cent. of the shares of each company. In the former of these is included the General Electrical Co.; which was closed by order in June, 1915, and in the latter the Siemens and Halske, and Siemens & Schuckert concerns, which were closed down under the same order.

The idea of the direct participation of the Government in the electrical industry took form in May last year in connection with the effort to save the Russian electrical industry from the dominating influence of German capital and of German electro-technical control. The investigations carried out by the Ministry of Trade and Industry disclosed the very close dependence of the most important Russian electrotechnical concerns on Germany. The German A.E.G. was the founder of the Russian General Electrical Co., and continued to be its technical controller till war broke out. About three-fourths of all the shares in the Russian company were in German hands. Similarly, in the Siemens and Halske and the Siemens-Schuckert concerns the technical control was held in the hands of German firms of similar name. It is true that in the first of these the block of real German shares hardly exceeded 10 per cent. of the total, but in the Siemens-Schuckert concerns about three-fourths of the shares were in German hands.

The manner in which German electrical authorities and organisers secured the virtual subjection of the electrical industry of other countries to their influence is well known, and it is not new to learn that in Russia, too, the most important electrical concerns proved to be members of these German electrical trusts, at the head of which stand the firms named. But it was the technical and financial completeness of the German electrical measures that brought the Russian governing power face to face with the necessity for inquiring what was the best method for suppressing the connections between the Russian and the German electrical industries. The usual sale of the concerns in Russian hands, or the purchase of the German shares for their further distribution on the private market, appeared to be impracticable, for it would have been impossible to guarantee against the purchase of such shares by the same German firms after the war. Their schemes for the domination of electrical affairs in other countries left no doubt at all that after the war they would imme-

diately endeavour to resume their lost position in Russia.

Meantime, the electrical industry acquired quite exceptional importance, not only for national defence, but for all other industries, because of the rapidly growing electrification of such industries. It is recognised that they who hold in their hands the keys of the electrical and electrotechnical concerns have the ability to compel other branches of industry to listen to them, and the more the electrical industry is organised, and the more it is syndicated the greater becomes its power over the consumer. From this point of view, the dependence of the large Russian electrotechnical concerns on the German trusts appeared to the Russian authorities to be particularly dangerous, and to merit complete and final suppression.

It was under the influence of such considerations that the idea originated of securing the direct participation of the Government in the electrotechnical industry. The struggle with German influence was only the starting point in the development of this idea. The deciding factor, at least after the revolution, was an effort to subject the electrical industry to the real and essential, and not only to the apparent and formal, control of the Government. The Government as shareholder in the business, and as joint-owner of the concern, felt more capable of achieving its ends in the world of the electrical industry than would a Government in the person of its superintending agencies.

But the Ministry of Trade and Industry never sought to obtain a predominating position in these concerns, and to subject them entirely to its will. The Ministry preferred to retain for itself in both concerns only 35 per cent. of the shares; for the control of a third of the total capital, which involves due influence in the whole business, at the same time, does not deprive the concern of its private commercial character, or make it a Treasury concern. In the General Electrical Co. the Ministry found it convenient for a time to reserve, besides the 35 per cent., a further 15 per cent. to 20 per cent. of the shares which, for sundry reasons, were left unallotted, partly in view of the changeable situation and the desire of the Ministry not to set free blocks of shares without the guarantee of the standing of those who might acquire them. But this temporary retention in the *portefeuille* of the Treasury of a supplementary packet of shares by no means indicates a variation of its original decision to limit its participation to one-third of the capital, as on the first suitable occasion such shares will be handed over to private control.

On June 30th, 1917, the constituent meeting of the General Electrical Co. was held, and the first test of this particular form of private-cum-Treasury enterprise may be considered accomplished. The complete formation of the Siemens Co. has been somewhat delayed, but this delay can hardly extend beyond the autumn.

The situation is a very interesting one. Of course, there is little in common between Russian electrical affairs and such affairs nearer home. The question has been asked in regard to our own country, and in regard to the Colonies, what safeguards we shall adopt to prevent a return to German ownership now eliminated, after the war. Russia seeks to secure that end by a measure of financial control. Strong hands and strong measures are both necessary in order that success may be assured. It is to be hoped that the participation of the Government may attain the ends in view, and that those who become the representatives of the Treasury in these concerns will prove to be firm and reliable protectors, not only of purely Treasury interests, but also of the interests of Russian industry as a whole. At this moment of exceptional crisis through which Russian industry is passing, the latter consideration is incumbent on them no less than the former.

Traffic Congestion in Manchester.

THE report of the Traffic Congestion Special Committee of the Manchester City Council, of which an abstract appears in our columns this week, will be of considerable interest to the ruling authorities of many of our large cities, who will sooner or later have to face problems of their own, which, if not identical, will involve very similar principles.

The report is comprehensive in that it discusses the combined effects of all classes of vehicular traffic on street congestion, and further explores the possible steps to be taken in the future, with a view to securing a continuous and well-defined policy in regard to these matters.

The more immediate proposals relate to the construction of several tramway termini round a portion of the inner city area, thus short-circuiting the cars at selected points and eliminating the bulk of them from the streets of the inner area. We note, however, that the Watch Committee made a more drastic suggestion, namely, that the cars should be considerably reduced in number or *entirely excluded* from the central area between the hours of 10 a.m. and 5 p.m., and that, in the latter case, motor buses should be employed to deal with cross passenger traffic. There is nothing the passenger dislikes so much as changing from one vehicle to another unnecessarily, and we imagine these passengers would be very cross indeed. It should, moreover, be noted that the street congestion in the vicinity of the terminals will be seriously increased at certain hours due to foot passenger traffic.

One suggestion of the Watch Committee, which deserves commendation, is that improved and efficient methods of handling goods from vehicles standing in the street should be made compulsory. There is no comparison between the private individual or firm, which conducts its business in such a way as to interfere with the public use of the street, and the possible obstructions caused by a tramway, which is a public undertaking, operating for the benefit of the people as a whole.

The Tramway Committee's arguments against the employment of motor buses on already congested routes are, of course, unanswerable, but the suggestion that the financial benefits to the city in respect of rates on track and maintenance of roads would in such a case disappear, is somewhat beside the point. In any case, the buses would, no doubt, contribute on a mileage basis to the maintenance of the roads which they regularly used. The report, as a whole, leads one to the conclusion that the time is rapidly drawing near when any form of street passenger transportation will be inadequate to deal with the traffic on certain routes, and that the problem of underground transport will have to be faced at any early date.

Publicity and Trade Development.

WITH regard to the question of the organisation of our publicity services, concerning which Mr. D. Ross Kennedy writes on another page of this issue, we would suggest that British manufacturers and traders look into this department of their operations without delay. We make the suggestion with a full knowledge of what has happened in the past, when some of our manufacturers have failed to appreciate the importance of efficient publicity service in the technical Press, and with a varied experience of the high place which such activity holds in the esteem of Continental manufacturers. The British manufacturer who is doing important work which it would profit himself and the electrical world gener-

ally to know about, makes a lamentable mistake when he adopts the policy of hiding his light under a bushel. Suspicion of his competitors and the desire to suppress information concerning the contracts that he is securing, and the machinery, apparatus, and installation work that he is supplying, or has supplied, may do him a certain immediate service by depriving his rivals of information for a short time, but it may prevent the great purchasing world from putting business his way. Safeguards of a reasonable kind can always be employed without depriving the public of valuable information. But it is not only suspicion that has prevented this matter from receiving the attention that it deserves. There have been cases without number where firms have been too busy to attend to such things, or have not thought it worth while to furnish interesting material when the Press has asked for it. Our experience proves that one of the things required by the reader who counts from the purchasing power point of view, is such information as we have mentioned, and if its preparation is only done in a haphazard sort of way, or is nobody's business in particular, the Press is deprived of an opportunity for service that it desires to render. Of course, much depends upon the kind of information that is imparted and the manner in which it is served up. There are right and wrong methods in publicity—we have had experience of both. There is superficial publicity matter which tells nothing; there is a publicity zeal (sometimes childlike and bland, at others bold as a lion) that an editor finds it necessary to humour or to moderate; and there is that unnameable monstrosity which brazenly exposes itself as a conditional appendage of an advertisement. These are objectionable features which experience removes—in some cases. There is no question that after the war the electrical and engineering manufacturer will need as part of his trade-development department a reasonably and efficiently conducted publicity service, and it will be well if the matter be fully considered now.

Prospects in Majesty's Trade Commissioner in New Zealand. New Zealand, Mr. R. W. Dalton,

dwells upon the bright prospects in store for British trade after the war. Some points in this report worthy of special consideration on the part of engineering firms are summarised on another page. Mr. Dalton's remarks are, however, all well worth study by anyone interested in export trade, and it is safe to say that had the report been made by a German Consular representative, it would have been held up as a pattern of what our Trade Commissioners ought to endeavour to compile. Mr. Dalton puts forward the plea, which has been heard before from Dominion markets, that British manufacturers should take their customers more into their confidence on the subject of present difficulties of delivery. Were they to do so they would find New Zealand purchasers sympathetic, and ready to abstain from trade with foreign countries as much as they possibly could, and to revert to British sources of supply after the war. This attitude of patriotic support is not, however, unconditional. Our manufacturers, again, are exhorted to give more study to the market's requirements, to advertise more widely, to treat their agents with greater liberality, and to realise that, although intrinsic merit is a great factor in capturing business, a greater factor still is price. If they will do all this, splendid opportunities await them for participating in the development of trade and industry in New Zealand, which is sure to come sooner or later after the conclusion of Peace.

ENGINEERING PUBLICITY.

BY D. ROSS KENNEDY.

THE contemplated publicity campaign by electricity supply undertakings has raised numerous suggestions and theories on the publicity methods which could be employed with some prospects of success.

The proposals have been more or less repetitions of old-established methods of advertising, from which it would seem that publicity and advertising are synonymous, whereas advertising is but a comparatively small branch of publicity.

The interest shown, however, augurs well for the future of publicity and, let us hope, commercial affairs generally amongst engineers, whose habitual attitude in the past has been one of indifference, if not of antagonism, to anything related to the commercial side of their profession. With a deeper interest in these matters, the fact will be revealed to engineers that a properly-organised publicity department can render them valuable service, whether their work be in the design office or the factory.

Under war conditions the organisation of British engineering establishments has been greatly improved. The increased outputs obtained, although not altogether due to the reorganisation, are nevertheless proofs of the necessity which existed for it.

These improvements have been confined principally to production, as under the circumstances there was no inducement to interfere with the commercial organisation, but the improvements which were found to be so necessary in the methods of manufacture, may be taken as an indication of the urgent need for reorganising engineering commercial methods as well when normal business conditions are restored.

This applies more especially to the publicity and sales organisations. The neglect of organised and systematic methods for the sale of engineering products has been often commented upon, without much beneficial effect, but if the results of war organisation have been appreciated, the *status quo ante bellum* will not be resumed.

The awakening interest of engineers has brought into prominence the advantages associated with the employment of the "selling engineer" in place of the "commercial traveller." The adoption of this system would be a material aid to the commercial progress of the engineering industry.

The average commercial traveller invariably has to "refer to head office" for information on technical points, which could be satisfactorily dealt with on the spot by the sales engineer, who also is more competent to use, and with much greater effect to apply, the technical information and data conveyed to him from the designers and producers, through the publicity department. He is also in a position, by reason of his technical training, to appreciate the value of acquiring data for the use of the factory technical staffs, the importance of which would not appeal to the commercial mind.

The systematic collection, analysis, compilation, and distribution of technical data form part of the duties of a publicity department. There is also the preparation and distribution of publications, in which technical and scientific data are reduced to a form of commercial value. An efficient publicity department is, therefore, an absolute necessity in modern factory organisations, and particularly so if the employment of selling engineers is to be a success, and the accompanying advantages are to be profitably utilised.

The publicity department is indispensable to the selling department, whilst to the technical staff it is a valuable aid to efficiency. Through the medium of the publicity department harmonious relations are established and maintained between the commercial and technical staffs, so that commercial and technical data and information are freely contributed with beneficial results to the whole factory organisation.

The modern publicity department embraces five sections:

1. Publication.
2. Records and data.
3. Advertising.
4. Photographic.
5. Distribution.

These five sections are centralised under the supreme control of a publicity superintendent, so that they can be worked together systematically, and, as a consequence, concentration of effort can be more readily obtained, a result of no little importance in publicity operations. Each section is organised on lines to suit its particular work, under the head of a specialist with competent assistants. The more important members of each section must have a good general technical experience in addition to their specialised training.

1. The publication section prepares technical and commercial literary matter in several forms of publications treating of the products of the factory, the publications being compiled, arranged, illustrated, and printed according to their use and destination, which may be broadly classified as for (1) public distribution (home), (2) public distribution (abroad), (3) private circulation.

2. The records and data section receives all the information and data relating to the products of the factory, which other departments, commercial and technical, inside and outside the factory, contribute to the publicity department, including prints of all photos. taken by the photographic section. All this material is analysed, indexed, and filed in the record section in a condition easily available for use by the publication and advertising sections. Applications by other departments of the factory for unpublished data, tests, reports, &c., are therefore made to the publicity department, thus obviating a certain amount of duplication which would otherwise occur.

3. The advertising section prepares and issues advertisements for insertion in periodicals, trade journals, directories, and other advertising media. This section is also responsible for the design and composition of supplementary advertisements, consisting of posters, wall cards, calendars, blotters, diaries, and other devices forming more or less permanent advertisements. This class of advertising yields most efficient results, when the device is presented in an attractive, educational, or useful form of personal value to the recipient, and is one which could be cultivated to a greater extent, with much advantage, by engineering advertisers.

4. The photographic section secures photographic records of the factory products in course of manufacture, when completed and in actual use, and also the methods and processes used during manufacture and construction. Photographs selected by the publication section for illustrations in publications are prepared for blockmaking by the photographic section, which is also responsible for obtaining satisfactory blocks from the approved retouched prints.

5. The distribution section receives and stores all completed publications, and is responsible for correctly addressing and dispatching them. The work of this section is important, and invites the use of ingenious systems of classification and indexing, so as to modify the work of circularising, which is apt to become involved.

The above only briefly outlines the work of a modern publicity department, but will serve to indicate to some extent its sphere of operations. The class of work dealt with in the factory dominates, more or less, the extent of the activities of the publicity department, but there is no organisation embracing either the manufacture or sale of electrical or mechanical engineering products which would not benefit from a publicity department organised on sound lines to suit the surrounding conditions.

For the purpose of electricity supply undertakings the work of the publicity and selling departments will differ in some ways from that of these departments in a manufacturing concern, but their organisation will be substantially the same. It has been suggested that the methods employed in the American "Do It Electrically" campaign should be adopted in this country.

This campaign was organised by a coalition of electricity supply companies, manufacturers of, and dealers in, electrical apparatus, who formed a "Society for Electrical Development," which had for its object the "electrical" education of the people, whereby they would become familiar with the uses to which electricity could be put, and with the attendant advantages and costs of electrical appliances. All publicity efforts are more or less educational in effect, but an appeal with "electricity" in the

foreground as the subject of study would not produce results commensurate with the work and expense entailed. This applies more so to this country, the people of which, on the whole, are not inclined to devote time and mental exertion to the study of a subject which will ultimately become an outlay of money. But as the most fertile field for increasing the demand for electricity supply will be found in the homes of the people, indirect and more subtle methods than the American scheme could be adopted, with much greater prospects of rousing the interest of the average man and woman, to whom the word "electricity" conveys an impression of something beyond their ken, involving vague risks in its control when that demands a closer intimacy than the operation of a tumbler switch.

The commercial value of co-operation is now recognised; and, in the first place, co-operation will be required between supply authorities and the dealers in and manufacturers of apparatus, and also with wiring contractors. The cost of appliances and apparatus must be spread over a period of time, so that electrical heating, cooking, and cleaning appliances may be installed in houses on terms of hire or purchase by instalments.

The introductory publicity operations should consist of the preparation and distribution of pamphlets or booklets of an attractive form, treating, in a concise and interesting manner, of the work and operations on which the apparatus would be employed, giving hints and instructions, not in conjunction with any particular apparatus but on the best methods of carrying out the work irrespectively of the type of appliance or apparatus employed. The electrical apparatus would be eventually brought forward and effectively shown to be the cheapest, most efficient, and most suitable for the purpose, and to provide, at the same time, the ideal conditions under which the work was described as being carried out. Practical demonstrations of the working and operation of the apparatus would be given under conditions familiar to the probable customer. These demonstrations would be organised by the selling department, assisted by the advertising section of the publicity department.

In such manner as outlined above, householders could be drawn into a familiar and appreciative attitude towards electrical appliances, not because of the electrical attributes of these appliances, but for reason of their utility and inherent advantages, and, no doubt, in due course, with the use of amplified publicity methods, the electrical factor would come to be regarded just as indispensable to home life as it now is to industry.

Another fruitful field for central supply authorities to cultivate is the use of electric vehicles in cities and larger towns. This, the most economical and reliable means for short transport service with frequent stops, has made little progress, due in great measure to lack of facilities for charging and repairing batteries at reasonable cost. Supply undertakings could develop the neglected commercial possibilities of this field by organising traction battery charging, repairing and testing departments at the central stations.

Again, by co-operation manufacturers and dealers would place on the market vehicles without batteries. Charged batteries would be hired and exchanged at the electricity supply station just as simply as the motor-vehicle owner obtains petrol supplies from a garage or petrol store. The low prices of the vehicles and the small operating costs provided by this system would guarantee its success, and its popularity could immediately be achieved by the modern publicity department. Apart from its commercial value, this system would also provide a variable load under the control of the central station, and afford a means for filling, to some extent, the valleys in the load line.

Export Facilities to the Continent.—Manufacturers or merchants wishing to deliver goods safely and expeditiously in Italy, France, or Spain, may be interested to know that the Lep-Transport and Depository, Ltd., of Castle Street, Long Acre, W.C. 2, has a well-organised system of transport to these countries by way of the Channel ports of Northern France. During the last few weeks they have carried thousands of tons to Italy by way of France.

ELECTRODES FOR ELECTRIC FURNACES: THEIR MANUFACTURE, PROPERTIES, AND UTILISATION.

THE physical and chemical nature of furnace electrodes, their position in the furnace, and their electrical and mechanical properties all exercise great influence on the quality of the product and the efficiency of the furnace. The electrodes must be refractory, in order to withstand a working temperature of about 3,000° C. They must be good conductors of electricity at all temperatures, poor conductors of heat, and exert no injurious chemical effect on the desired reaction in the furnace. Metals, alloys, and certain mixtures are used for electrodes in some furnaces, but carbon (either amorphous or graphitic) is by far the most generally useful material fulfilling the above desiderata.

The raw materials used in making amorphous carbon electrodes are gas-retort coke, anthracite, and tar coke or petroleum coke. The base of manufacture is material rich in carbon and with a minimum of ash and volatile matter. The agglomerant is dry tar. The permissible limits of impurities are silica 0.5 per cent. and iron oxide 0.2 per cent. Silica is particularly objectionable where the electrodes are to be used in making aluminium. Various chemical and physical processes are employed in order to reduce the percentage of ash and of volatile matter in the raw material.* Petroleum coke is the raw material most used; according to its origin, it yields from $\frac{1}{2}$ to 2 per cent. of ash, $1\frac{1}{2}$ to $1\frac{1}{2}$ per cent. of sulphur, and 12 to 15 per cent. of volatile matter. After treatment the coke contains about 0.5 per cent. of silica, 0.15 per cent. of iron oxide and alumina, and 0.05 per cent. of soluble soda salts. As for graphite, artificial material (produced by "graphitising" the electrodes) is generally employed in preference to natural graphite.

Whatever the variety of carbon, it is ground until 40 per cent. passes a No. 100 screen; 15 per cent. passes No. 60; 20 per cent., No. 30; 15 per cent., No. 16; and 10 per cent., No. 8. A minimum proportion of tar should be used as agglomerant, and 10 to 12 per cent. is sufficient when electrodes are squirted mechanically under very high pressure. Tar for fixed electrodes (soles, &c.) may contain 60 per cent. of volatile matter; but for rod electrodes it should contain no more than 40 to 45 per cent. After being mixed thoroughly the compound is squirted through dies, or pressed in moulds, at about 2 tons per sq. in. The baking process, which eliminates volatile material, converts the tar to carbon, renders the electrodes hard and compact, and increases their electrical conductivity, is effected in continuous furnaces with a maximum temperature of about 1,300° C. Other types of furnaces are used in special cases. The heating, baking proper, and very slow cooling occupy altogether eight to ten days. The finished amorphous carbon electrode has a density of 1.6 to 1.65 and a porosity of 18 to 20 per cent.

Graphitic Electrodes.—The manufacture of these, based on the conversion of amorphous carbon to graphite at high temperature, may be effected by the Girard and Street (Le Carbone) process or by the Acheson process. In the Carbone process the rod of raw paste is passed continuously through a small chamber in a carbon block, where it is exposed to the intense heat of an arc between carbon electrodes set at right angles to the rod under treatment.

The Acheson process consists simply in heating, by the electrical resistance of the charge itself, a mixture of coke and oxide (alumina, iron or manganese oxide or silica), or simply an anthracite with a high percentage of ash. The first product is carbide, which then dissociates into graphite and the original oxide. The impurity plays simply a catalytic part until graphitising is completed, and is then volatilised. From anthracite yielding 6 per cent. of ash, Acheson obtains graphitic electrodes yielding only 0.033 per cent. of ash. According to Jean Escard (*loc. cit.*) the price of these electrodes (about £80 per ton in France) is the chief reason against their use in French works, especially in aluminium manufacture, where (owing to liberation of oxygen at the anode) the life of graphite electrodes is not much longer than that of amorphous electrodes. In electrometallurgy, on the other hand, the surfaces in contact are smaller, and the resistance to oxidation of graphitic electrodes is so much greater that their consumption does not exceed 40 per cent. that of amorphous electrodes. It is probable that a number of French electrometallurgists will make their own graphitic electrodes in future. Where water power is available, a stock of electrodes can be made economically during periods of high water, to utilise power only temporarily available, and hence not capable of economical use in the main furnace equipment.

Properties and Utilisation.—The physical properties on which depend the performance of electrodes in service are:—Their specific gravity, mechanical strength, sonorosity, hardness, density, and conductivity to electricity and heat. Their industrial value depends, above all, on the purity of the raw materials, the fineness to which the latter are ground, the proportion of agglomerant, the pressure of moulding or squirting, the baking process, and the composition and percentage of ash and volatile matter.

Density, Hardness, State of Surface.—The density of electrodes ranges from 1.45 to 1.6, and its apparent value (without allowing for interstices) is obtained very easily by dividing the weight by the volume of the electrode, as calculated from its dimensions. The apparent density gives a good measure of the degree of disintegration in service. The true density (requiring a vacuum pump for its determination) is a useful guide to the purity of the electrode, and varies inversely with the hydrogen content.

Good electrodes are generally very hard, so much so that they should be moulded to the desired details of form before baking. Their surface should be as smooth as possible, in order to secure good contact with the terminals. Improvements in manufacture have reduced the risk of breakage with sudden variations in temperature. Formerly such breakages were common (especially at screwed joints), and caused serious delays. The best way to detect and locate breakages is to thrust a bar into the furnace and on to the electrode; if a sonorous sound is emitted when the end of the bar is struck by a hammer, the electrode is still sound. Graphite electrodes, though weaker in tension than amorphous ones, are less brittle. This is due largely to the high temperature at which they are made and to the species of annealing which they receive in cooling. The annealing renders the structure more homogeneous and improves the thermal conductivity of the graphite.

Chemical Properties and Effects.—Carbon being a powerful reducing agent, one has sometimes to use metal electrodes of the same metal as is being treated, in refining furnaces. Generally, however, the oxidising effect of a slag can be adjusted to overcome the carburising effect of the electrodes to any desired extent. Of the impurities in electrodes, sulphur is particularly injurious in steel manufacture. There may be 1 per cent. or more of sulphur in electrodes sold as "first quality," and this may introduce 0.005 to 0.006 per cent. of sulphur in the molten metal. Even after prolonged baking, electrodes contain 0.25 to 0.4 per cent. of hydrogen over and above the amount corresponding to moisture absorbed after cooling; the proportion of such water is generally between 0.25 and 0.35 per cent.

Conductivity.—Carbon electrodes conduct heat less readily than metals, so that a temperature difference of, say, 1,500° C. may be maintained between the ends of an 18-in. electrode. Several writers, including Herring, state that the thermal conductivity of graphite diminishes rapidly with rising temperature, whereas that of amorphous carbon increases. For electrodes working at 1,400° C. in the furnace and with one end water cooled, the relative conductivities (copper = 1) are:—Acheson graphite electrodes, 0.34; amorphous carbon, 0.17.

Carbon is a worse conductor than metals, but improves with rising temperature, so that the current density can be increased without causing excessive heating. The resistance increases with the proportion of agglomerant or binder, but decreases with higher pressure of moulding and temperature of baking. The resistance in ohms per metre \times sq. mm. of various electrode carbons is as follows:—

Ohms per metre \times sq. mm.	Cold.	Hot.
Acheson graphite	37.45	14.06
"Retort coke"	21.90	15.56
"Ceylon graphite"	54.73	56.88
	56.84	6.09 (?)

The high conductivity of graphite electrodes permits smaller sizes to be used for a given current. This means initial saving in material, and also smaller electrode surface exposed to the oxidising action of the furnace products.

The electrical resistance of electrodes may be measured simply by the fall of potential in a measured length of electrode through which a measured current is passed. A double Thomson bridge gives more accurate results. In either case, the test current must not heat the specimen appreciably. Contact resistance may be eliminated by drilling small cups in the ends of the test pieces and filling these with mercury. Axial strips or bars of metal are sometimes included in the construction of electrodes to reduce the electrical resistance, and increase the mechanical strength (see "Compound Electrodes" later).

The mechanical pressure used in forming electrodes varies the electrical resistance within wide limits by pressing the particles of carbon more or less tightly together; consequently, it affects also the permissible current density. A usual allowance for mean current density is 3 to 4 amperes per sq. cm. of section (19 to 26 amperes per sq. in.). If special cooling facilities be provided the current may be increased to 10 amperes per sq. cm. (64½ amperes per sq. in.) as an absolute maximum in amorphous electrodes. Graphite electrodes may carry 20 amperes per sq. cm. (130 amperes per sq. in.), which is a great help where the highest temperatures have to be attained by expending great power in small space.

Form, Dimensions, and Arrangement in Furnace.—The shape and length of electrodes vary according to the application. At the Ugine works (Savoie), round electrodes are 28 to 35 cm. diameter and square electrodes 25 to 33 cm. side, the length being 1.6 to 1.8 metres for both patterns. Large section simplifies working and reduces the number of electrodes required; the strength of the electrodes is, however, reduced, and their individual weight becomes serious. Also, in the event of breakage, it may be difficult to remove the large fragments before the charge is lost by cooling or by carbonisation. The simultaneous use of several small electrodes offers the advantage of being able to increase the current density, but since a certain space must be maintained between electrodes, the total section of the latter must be reduced, and with it the daily output. The electrodes may be arranged in several rows; for instance, four rows of eight or nine electrodes (each 8 to 10 cm. diameter) may be used in aluminium manufacture, the total current carrying section of the 32 or 36 electrodes being 0.256 to 0.288 sq. metres. The square carbons (25 cm. side) are arranged in two rows of five.

In the two-phase iron smelting furnaces at Trollhattan, four square electrodes are used, each 66 cm. square and built up from four 33 \times 33 cm. electrodes. The complete electrode is 2 metres long, weighs 1,300 kg., and is set at 65° to the horizontal. About 25 cm.

* Details of these processes are to be found in *Le Génie Civil*, Vol. LXXI, pp. 65 et seq., whence the present notes are derived.

length is wasted by the arrangement used to secure perfect connection with the supply leads. In the Stassano three-phase furnace, three or six 8-cm. round electrodes are used in the 500 and 1,000 H.P. sizes respectively. These are set radially through the furnace walls at about 15° with the horizontal. The advantage of round electrodes is that they can be utilised completely by screwing new lengths into the back of stumps.

It is now usual to employ four, eight, or twelve 25-cm. sq. electrodes (1.75 to 1.9 m. long, and working at 4 amperes per sq. cm.) in furnaces for ferro-alloys. This gives a high conductivity arrangement, and if one of the electrodes breaks its renewal involves less loss of time and material than the replacement of a large electrode equivalent to all or some of the smaller ones.

Sole-electrodes *M* (fig. 1) may be built up of a number of prismatic electrodes clamped closely together and generally placed on a strong iron plate *f* connected to the supply leads. The crown

FIG. 1.

FIG. 2.

of the electrodes forms the bottom of the furnace, and all around them is packed carbon *pisé* *e* to ensure tight joints. This arrangement is used in several aluminium works. Sometimes the sole-electrode is formed in a single block *A*, fig. 2 (showing a furnace for electrometallurgy), which is moulded in place, the whole basin being then placed in a baking furnace before use. Leading-in conductors, *I*, are generally embedded in the base block in such a case.

Horizontal electrodes in one or several units are used in furnaces for making carborundum or graphitic carbon. Circular electrodes are used in certain melting furnaces and for the manufacture of alloys. In the Girod furnace, which utilises peripheral resistance, the electrodes are blocks of carbon *AA'*, *BB'* (fig. 3), grouped two

FIG. 3.—GIROD PERIPHERAL ELECTRODES: VERTICAL AND HORIZONTAL SECTION.

by two in parallel, and leading current to a semi-conducting mass *m* surrounding the melting pot *C*. This furnace is particularly useful in the manufacture of ferro-vanadium by direct union of the elements.

In the Conley furnace (fig. 4) electrodes *EE'* are embedded in the masonry, and consist of four sectors *e*, connected by refractory, con-

FIG. 4.

FIGS. 5 AND 6.

ducting masses *e* of graphite *pisé* (rammed). A circular electrode *M* (fig. 5), protected externally by refractory brickwork, is used in conjunction with a movable vertical electrode *L*, in one of the Heroult furnaces for reducing iron ore. The electrode *M* forms

also a crucible, but is kept so low that current is forced to travel through the charge. Hollow electrodes built up from a number of interlocking blocks *A* (fig. 6) serve to carry current, and admit materials into the furnace; they have been used for some time in the manufacture of calcium carbide. So-called "fluid" electrodes are used in certain furnaces, where the fuel forms one electrode which flows as the reaction proceeds; as a matter of fact, there are two fixed electrodes, but it is the reducing-carbon which transmits current to the mineral under treatment.

Length of Electrodes.—Longer electrodes mean less loss of material in the shape of stumps, but greater loss of energy by Joule effect. For each individual case there is a certain "most economical" length of electrodes, which may be calculated from Lou's formula:—Economic length = $l + \sqrt{(2,000 \cdot s^2 \cdot l \cdot d \cdot k \cdot b) / (r \cdot i^2)}$; where *l* = mean length of stump when replacing electrode (cm.); *s* = section of electrode (sq. cm.); *d* = density; *k* = average consumption (cm. length per hour); *b* = difference between price of electrodes and value of stumps (fr. per kg.); *u* = cost of energy (fr. per kw-hour); *r* = resistivity of electrode; and *i* = current. For example, the most economical length of a 400 sq. cm. electrode, carrying 2,000 amperes, and used to a stump length of 50 cm., is found to be 1.91 metres (6¼ ft.), if *u* = 0.01 fr. (0.1d.); *r* = 0.006 ohm; *k* = 0.5 cm./hour; *d* = 1.5; and *b* = 0.004 fr.

(To be continued.)

METROPOLITAN POWER-STATION ENGINEERS.

WE are informed by Mr. W. J. Webb, of the London District Committee of the Electrical Trades Union, that a Conference, at which Sir George Askwith presided, was held, on September 5th, at Montague House, Whitehall, between representatives of the Associated Municipal Electrical Engineers and the Electrical Trades Union, concerning rates of wages, war awards, and conditions of employment of power-station and sub-station engineers. The Conference lasted nearly three hours, and was of a perfectly amicable character throughout, and Mr. Webb suggests that it will not be long ere the green card issued by the Electrical Trades Union as working rules and conditions for station engineers is a settled thing. The following are the short notes of the Conference issued by Sir George Askwith:—

At a Conference held on September 5th, 1917, under the chairmanship of Sir George Askwith, in regard to claims reported by the National Electrical Trades Union (with the National Union of General Workers), it was agreed that the secretary of the Associated Municipal Electrical Engineers should ascertain from the Borough Councils in the list given below of the boroughs included in their Association whether the Associated Municipal Electrical Engineers, with such members of the Councils as may be desired by each Council, can be authorised:—

(a) To treat with: 1. The Electrical Trades Union in respect of uniform payment and conditions for electricians at power stations on the basis of the Union trade card and in respect of the settlement of the war wages to be added to the wages which may be agreed.

2. The National Union of General Workers (and possibly the Bricklayers' Union and the Workers' Union) for consideration of the wages of the semi-skilled and unskilled men employed at power stations controlled by Borough Councils in the Greater Metropolitan Area, having special regard to the possible principle of uniform payment; and (b) to have power to refer points, failing agreement, to conciliation or arbitration.

(Signed) G. R. ASKWITH.

A Conference of members of the engineering staffs of electricity supply stations of London was held at St. Bride's Institute, Fleet Street, E.C., on September 5th, with the object of discussing the question of the organisation of central-station engineers in the London area. Mr. Chalmers Kearney was the chairman, and the A.E.S.E. was represented by Mr. W. Arthur Jones, A.M.I.E.E., President of the A.E.S.E.

After a few introductory remarks by the chairman, Mr. H. W. Healey proposed that an Association be formed for the shift engineers of London electricity supply stations. Another speaker suggested the advisability of joining the Chief Technical Assistants' Association.

An amendment was moved by Mr. W. A. Jones in the following terms: "That this meeting of engineering representatives of electricity supply stations in the metropolitan area, considering the

need for their collective organisation to be imperative, do hereby resolve to ally themselves with the London Branch of the ASSOCIATION OF ELECTRICAL STATION ENGINEERS."

The speaker, in moving the amendment, reviewed briefly the history of the A.E.S.E., the objects of its existence, its accomplishments in the past, and its work for the future.

After a brisk discussion, the matter was put to the vote, and the amendment declared carried.

Similar conferences are about to be held in most of the important electrical centres in the provinces. Next week the station engineers of the Birmingham district will meet to discuss the question of their organisation. The lead given by their London confrères will, no doubt, influence their decision. All particulars of the A.E.S.E. can be obtained from the Hon. Secretary, Mr. W. J. Ebben, 26, Little Park Gardens, Enfield.

NEW ELECTRICAL DEVICES, FITTINGS,
AND PLANT.

Readers are invited to submit particulars of new or improved
devices and apparatus, which will be published if considered of
sufficient interest.

Electrically-Driven 20-in. Bar Mill.

In a new extension of Messrs. Johnson's Iron and Steel Works, West Bromwich, there has recently been laid down a 20-in. two-high bar mill, which embodies the latest improvements in the

FIG. 1.—300-H.P. "WITTON" MOTOR DRIVING THE MILL.

electric driving of rolling mills. The mill consists at present of one stand of rolls for dealing with ball furnace iron and steel blooms, and is driven direct by a continuous-current "Witton" motor (fig. 1); a fly-wheel is interposed between the motor and the mill. This motor has an output of 300 H.P. on continuous rating at 52 R.P.M., and has an overload capacity of 100 per cent. for short periods. It is designed for speed adjustment by shunt regulation from normal speed up to 100 R.P.M. on light load, and is compound-wound in order to give a drop in speed of about 20 per cent. between light load and full load, thereby enabling the fly-wheel to take a share of the load during heavy passes. In order to accommodate the motor to the particular requirements of various classes of work, a diverter is provided on the switch panel, enabling the amount of compounding to be easily varied. In this way the drop in speed of the motor can be adjusted, and the fly-wheel can be called upon for a heavier or lighter amount of work.

The flywheel is 18 ft. in dia., and weighs about 20 tons; it is equipped with a band-brake operating on the lower half, by means of which the mill can be brought rapidly to rest. The mill is driven from the flywheel shaft by means of a wobbler and disconnecting coupling.

A motor house encloses the motor, switchgear, flywheel with its bearings, and overhead travelling crane, the crane rails being continued so that the crane can also travel outside over the mill housings, for which purpose the portion of the steel partition at the crane level is arranged to swing open. Two doors completely enclose the electrical plant from the dust of the mill.

The motor is controlled by a switch panel fitted with expanded metal sides and door (fig. 2). This panel comprises a double-pole main switch, circuit-breaker, ammeter, voltmeter, watt-hour meter, speed regulator, diverter for carrying the compounding, and multiple-switch starter with grid resistances. The apparatus is interlocked by means of the special G.E.C. arrangement for rolling mills, which ensures the motor being started with full field and the switches operated in the correct sequence. By the same device the circuit-breaker is prevented from being closed should the starter have been left in the running position.

The power for driving the motor is supplied by the West Bromwich Corporation electricity department.

FIG. 2.—"WITTON" SWITCHGEAR CONTROLLING THE INSTALLATION.

The electrical plant and flywheel were supplied by the GENERAL ELECTRIC CO., London, to the specification of Messrs. Walter Dixon & Co., the consulting engineers.

Benjamin Industrial Signals.

The BENJAMIN ELECTRIC, LTD., of Rosebery Avenue, London, E.C. 1, have introduced a range of industrial signals primarily designed for use in connection with interior calling or fire-alarm systems, to supersede the use of bells, buzzers and gongs. Modern business and manufacturing requirements have demonstrated the absolute necessity of instant and unrestricted communication between departments and responsible officers of the organisation. The intercommunication telephone system fails to meet these requirements, inasmuch as it is only effective when the individual required is in his own office to receive the call. But there is frequent necessity for communicating with those officials whose duties require their moving about the plant or premises. The time wasted in locating them is liable to become a considerable item of expense, whereas by a prearranged signal sounded simultaneously in all departments, the individual is located in a few seconds, and the message delivered.

The ordinary bell or gong signals are inefficient in many cases owing to the lack of sound volume and tone quality necessary to enable them to be instantly heard above the roar of machinery. Under these conditions, the Benjamin industrial signals meet the case, their volume of sound being equal to that of four or five gongs and the tone quality such that there is no possibility of their harmonising with the usual noises of industry.

The signals involve no up-keep expense, operate on an exceedingly low electric current consumption, and are instantly responsive to either button or switch.

The design of the signals is such that the adjustment mechanisms are proof against careless attempts at adjustment. In the D.C. signals this point has had careful attention, while in the A.C. signals adjustments are not necessary. In the D.C. signals pure silver contacts are employed of sufficient area to take care of 50 to 70 per cent. overload. The windings in both types are of highest grade black enamelled copper wire, the whole being treated with plastic insulating varnish and baked, rendering them waterproof.

The D.C. signals operate in parallel, and a spark-killing device is connected across the magnet winding to eliminate erosion of the vibrator contacts; the A.C. signals work either in series or in

FIG. 3.—BENJAMIN D.C. SIGNAL.

parallel, and need no contacts. Both types are made for various voltages.

A master relay panel, illustrated in fig. 4, is made for use in conjunction with Benjamin industrial signals to allow of their operation on high-voltage circuits. By the use of the master relay, the signals may be operated by current from the lighting circuit and the signal given by switch-button as on ordinary bell circuits, this being especially useful where code signalling is required.

FIG. 4.—MASTER RELAY PANEL.

An ordinary telegraph key is recommended. The primary or push-button circuit is operated by three to six dry cells in series. By depressing one of the push-buttons, or keys, the low-voltage battery circuit is closed through the master relay coil, which in turn closes the relay contacts governing the high-voltage current supply to the signals.

The relay parts are mounted on a slate panel. The contacts are adjustable, so as to take care of any possible deterioration due to arcing. The primary or button circuit is in series with a knife switch, which allows the circuit to be temporarily opened if difficulty occurs in the push-button or its wiring. A test button is also furnished, in order that the entire system may be tested from the master relay panel. The entire panel is encased in a heavy sheet-steel box with hinged cover and lock. The relays have a capacity of 12 A.C. or 10 D.C. signals.

B.T.H. Truck-type Switchgear.

The BRITISH THOMSON-HOUSTON CO., LTD., of Rugby, has recently issued a new descriptive list relating to its truck-type ironclad switchgear for polyphase systems up to 11,000 volts. Such gear

FIG. 5. B.T.H. 6,600-VOLT SWITCHGEAR.

has been developed for use where "safety" in handling by unskilled labour and ease of carrying out extensions and alterations, with a minimum of interruption to supply, are essential requirements; it

constitutes a logical development on "safety first" lines, and the truck arrangement facilitates and simplifies labour operations.

Fig. 5 is a view of some 6,600-volt panels, with one truck removed: fig. 6 shows the general arrangement of a three-phase panel of this type. All the H.T. bus-bars and cable connections are carried on insulators mounted in frame castings which are built up to form the cell structure. The bus-bars are entirely enclosed in a continuous chamber at the back, and when the structure is against a wall access is obtained through handholes. Protecting covers for padlocking on to live cable and bus-bar terminals can be supplied, also portable cell-doors for closing a cell from which the truck has been removed.

The whole of the apparatus for each circuit equipment, including the oil switch, instruments, transformers, &c., is mounted on the

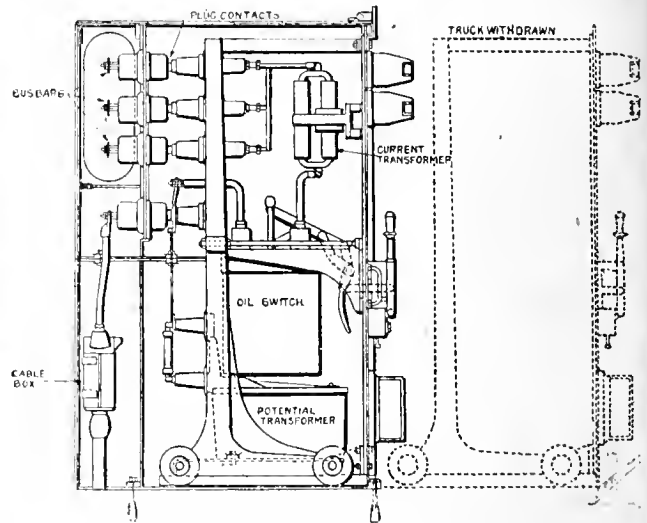

FIG. 6.—GENERAL ARRANGEMENT OF B.T.H. THREE-PHASE PANEL.

truck, which has contact jaws at the back which engage with fixed contact blades mounted in the back of the cell. The contact blades are sunk into porcelain insulators so as to obviate accidental shocks, &c., when the truck is drawn out.

Safety interlocks prevent the withdrawal or insertion of a truck with a closed switch. Non-automatic switches can be supplied on trucks required for bus-bar sectionalising or similar purposes. Switches can be fitted with two-coil or three-coil overload trips, low-voltage release or other automatic features. A special winch attachment can be supplied for lifting or lowering the switch tank. Potential transformers are air-cooled for circuits up to 6,600 volts, and oil-cooled for higher pressures.

Indicating and integrating instruments are mounted on the front panel of the truck, together with the switch-handle and automatic devices; synchronising equipment can be supplied, mounted on a swinging bracket or panel according to type. Standard trucks can be fitted with the B.T.H. split conductor or other special protective apparatus, and, when required, arrangements are provided for charging resistances to be added. Standard equipments are supplied for two-phase circuits of 4,000 and 7,000 max. voltage and 510 and 255 max. amperes respectively, and for 3,300, 6,600, and 11,000 max. voltage and 510, 510, and 255 max. amperes respectively.

THE MANCHESTER TRAFFIC CONGESTION REPORT.

THE Manchester City Council in March, 1915, decided to refer to a special committee on traffic congestion the reports of several committees dealing with traffic congestion and passenger transportation, with instructions to examine the various proposals, and make recommendations on the subject.

This committee (which was representative of the Finance, Buildings, Highways, Tramways, Watch, and Infirmary Site Committees) observes, as regards the Tramway Committee's report on the Passenger Transport Problem, that it points out that in order that the annual growth of passenger traffic in Manchester and the surrounding districts may be satisfactorily dealt with, new and improved transit facilities will be required. In planning these facilities a wide outlook is all-important. Any schemes carried out on narrow or confined lines ultimately result in serious losses to the community in every way.

The ultimate volume of passenger traffic which a tramway system can deal with is limited by the capacity of the arterial lines near the central parts of the city. When the traffic on these lines approaches the "saturation" point, then it is obvious that additional main arteries must be opened out or other transit facilities provided.

Certain main arterial lines near the central area of the city—particularly London Road and Oxford Road—have practically reached the limit of their capacity, and they will be quite incapable of dealing with the increased passenger traffic which will have to be handled in the future from the southerly and easterly sides of the city.

The report deals in detail with the following questions: (1) Is it the wisest course to open out new arteries for the increasing traffic? (2) Should new transit facilities be provided?

The Committee reviewed all the possible alternatives to the existing mode of transit, namely:—(1) Rapid transit lines (a) in shallow subways; (b) in deep level "tubes"; and (c) on elevated structures; (2) shallow tramway subways in the congested areas into which the surface cars could be run; (3) motor omnibuses; and came to the conclusion that the best method of meeting the requirements of the passenger traffic of the city was:—(1) The provision of additional arterial routes, and (2) the provision of suitable tramway terminals in the centre of the city.

The additional arterial routes and the tramway terminals suggested were considered by the Traffic Congestion Special Committee in conjunction with the reports and recommendations of the Watch and Improvement and Buildings Committees.

The report of the Watch Committee deals with the general question of traffic congestion in the public thoroughfares of the city, and states that there is an inner area where the congestion is rapidly creating a crisis which can only be met by the exercise of a firm control supported by adequate statutory powers. This area is that inner portion within a radius circumscribed by Deansgate, Market Street, Portland Street, and Peter Street.

Some modifications of the suggestions of the Tramways Committee were proposed by the Improvement and Buildings Committee, but, in the main, it approved the suggestions, particularly those relating to the proposed tramway terminals.

Although the three Committees concerned have approached the subject from divergent standpoints, there appears to be a general agreement (1) that there should be a limitation of tramway traffic within a certain prescribed area in the centre of the city, (2) that additional arterial routes should be opened out, (3) that certain tramway terminals should be established.

The Traffic Congestion Special Committee, having carefully considered the matter, endorses these points of principle, and, with certain modifications, approves the proposals for six arterial routes, which would necessitate the carrying out of extensive and costly street works.

The terminals proposed by the Tramways Committee are as follows:—(1) The old infirmary site, (2) Albert Square, (3) St. Peter's Square, (4) Marsden Square, (5) Cannon Street (Corporation Street), (6) Stevenson Square—a rearrangement of the existing terminal.

The Traffic Congestion Special Committee, whilst not committing itself to details of such proposals, is of opinion that they are absolutely necessary, not only as a means of meeting the constantly growing demands of the tramway traffic, but also as a means of lessening the general traffic congestion in the central area of the city.

By means of the proposed terminals the number of tramcars which now travel along the principal streets in the city centre will be reduced by at least 50 per cent.

The Traffic Congestion Special Committee is of opinion that it is necessary that some part of the old infirmary site should be utilised as a tramway terminal, but recognises that a complete scheme for dealing with such site should be prepared.

The tramway terminals which are suggested will greatly assist in dealing with the growth of passenger traffic on the north, the east, and the south sides of the city, but there still remains the question of the traffic from the west—the Salford traffic.

The Tramways Committee points out that, in view of the fact that the agreement with the Salford Corporation terminates on May 4th, 1924, it is not expedient to make any definite proposals at the present time as regards Deansgate and the provision of a tramway terminal at that side of the city; but the Committee suggested that negotiations should be opened up with the Salford Corporation with a view of coming to some new arrangements as to the future working of the two tramway systems so as to effect improvements in the general interests—a suggestion which the Traffic Congestion Special Committee fully agrees with.

The Watch Committee also calls attention to the obstruction caused by lorries and other vehicles having to stand in the streets waiting their turn to load or unload at the warehouses, and it suggests that regulations should be made with a view to the compulsory provision of adequate and modern appliances to deal with the loading and unloading of merchandise, and with proper accommodation for waiting vehicles other than in the street.

The Traffic Congestion Special Committee agrees with the Watch Committee that the congestion could be minimised by more complete control by the police, and it is of opinion that with this object in view wider powers should be sought from Parliament.

In submitting this report to the City Council, the Traffic Congestion Special Committee desires to emphasise that steps should be taken for providing additional arterial routes, giving quick and convenient access to the heart of the city.

In considering the requirements for passenger transport, the Committee has had in mind not simply the present form of surface transit tramways—but it has been alive to the possibility of other forms of passenger transport being developed in the future. It should, however, be clearly understood that, whatever form of surface transit may come along, more street accommodation in the shape of new arterial routes is urgently required. As has already been pointed out, London Road and Oxford Road have practically reached the "saturation" point for surface transit of any kind, and some relief routes must therefore be opened out.

The congestion caused by the ordinary vehicular traffic in the central parts of the city has been considerably reduced since the outbreak of war, and it is probable that after the war a large proportion of the merchandise transport will be dealt with by motor traction.

The scheme is presented as a whole, but the Traffic Congestion Special Committee points out that it is not suggested that all the proposals should be carried out at the present time, nor in the immediate future. Financial considerations arising in consequence of the war would obviously preclude this from being done.

A number of appendices are attached to the report which elaborate the various points dealt with in the latter.

One of these points out that, judging by past experience, the population 20 years hence will be one and a half millions; the number of journeys per head of population will, it is estimated, have reached 300, and consequently the total passengers carried will be at least 150 millions a year. The traffic density on seven of the principal routes varied (at the time of the report, 1914) from four and a half million to about three million passengers per route mile per annum, which compared roughly with the London tube traffic in density; the average revenue per passenger was, however, of the order of 1.1d., as against 1.5d.-1.7d. for the tubes.

The Committee adds that it is quite clear that the constant growth of passenger traffic on the surface lines must at no distant date reach a point when the construction of underground facilities will become an absolute necessity, and further recommends that a scheme be prepared, so that a rapid transit system can be dovetailed into the tramway system and the two worked as a combined system.

Touching on the use of motor 'buses, it is pointed out that if they were substituted for tramway cars on the Rochdale Road route, where observation showed a car every 40 seconds between 8 a.m. and 9 a.m., a 20-seconds' service would be required if full inside and outside, while in wet weather the service would require to be a 10 seconds one, practically necessitating a long string of 'buses nearly the whole length of Rochdale Road from Queen's Park to town.

The enormous increase in vehicles would add to the present difficulty in finding men to work the rush traffic. The tramways, in addition to giving £100,000 in relief of rates, pays over £30,000 rates on track and repairs, and maintains practically half the width of the principal highways of the city at a cost of about £30,000, and these two latter items would disappear if 'buses were employed.

The Watch Committee's report refers to the narrow width of the streets of the central area, the volume of traffic thereon, and the obstruction to free movement of traffic by the tramway cars monopolising the central portion of the streets, and goes on to suggest that next to widening the streets, the reduction or exclusion of tramway traffic would do more to relieve congestion than any other course. The time suggested for reduction or exclusion from the central area is between 10 a.m. and 5 p.m. It is suggested that this would interfere with public convenience very little, and that the cross passenger traffic could be fully met by the provision of motor 'buses.

ELECTRIC DRIVE FOR THE BATTLESHIP "TENNESSEE."

CONSIDERABLE interest is being taken in the superdreadnought U.S.S. *Tennessee*—one of the largest and most powerful battleships at present under construction—because it will be electrically driven. The displacement of the ship will be approximately 32,000 tons, and it will have a speed of 21 knots.

The propelling machinery will consist of four motors supplied by two turbo-generators, each motor driving one propeller shaft and developing 6,700 H.P. at 175 R.P.M. The current for the motors will be furnished by two standard Westinghouse steam turbo-driven alternators similar to those used in large power houses throughout the country. These will be of sufficient capacity to furnish power to the four motors, each of which is capable of developing a maximum of 13,500 H.P.

The steam turbines are of the impulse-reaction semi-double flow type, the high-pressure steam being expanded in suitable nozzles, and passing through a two-impulse wheel, after which it passes through the first reaction expansion, which is single-flow. It will then pass through a second expansion, which is double-flow. The dummy piston will be located

between the impulse wheel and the low-pressure reaction stage.

The turbine speeds will be controlled both from the engine room and from the operating room as follows:—

From engine room: Throttle valve mechanically operated; quick-operating safety-stop valve, hand-operated; quick-operating safety-stop valve, automatically operated by safety governor.

From operating room: Automatic governor control, regulated by adjustable speed-control valve; an emergency trip operated by pull wires for stopping the turbines.

The guaranteed steam consumption for the main generators and auxiliaries is as follows:—

Speed in knots.	R.P.M. Propellers.	S.H.P., total.	Steam consumption, lb. per S.H.P.
21	175.0	26,800	11.9
19	154.4	18,850	11.65
15	118.3	8,500	12.1
10	81.0	2,600	15.45

The motors for driving the propellers are of the alternating-current wound-rotor type, wound for approximately 3,400 volts, the stator having two independent windings, one for 24 and one for 36 poles, enabling different speeds to be obtained. The rotor winding will have one three-phase connection to three slip rings, and will be arranged so that with the 24-pole connection, the motor will act as an ordinary wound-rotor machine, and by means of suitable cross-connections it will act as a squirrel-cage machine on the 36-pole connection. Each motor will be separately ventilated by means of duplicate fans mounted on the top.

The motors will have a normal capacity of 6,700 H.P. at 175 R.P.M. on the 24-pole connection, and 2,125 H.P. at 118.3 R.P.M. on the 36-pole connection, and an overload capacity of 25 per cent. for four hours, or 8,375 H.P. at the maximum speed of 185 R.P.M.

Power from one of the turbo-generators will be supplied to the motors at any speed up to 138 R.P.M., corresponding to 13,500 shaft H.P. Speeds up to 118.3 R.P.M. will be obtained by running the motors on the 36-pole connection and varying the speed of the turbine. Above this speed the motors will be run on the 24-pole connection.

The motors will be operated as wound-rotor machines for starting and reversing, the 24-pole connection being used for this purpose. On the 36-pole connection, the motor operates as a squirrel-cage machine. In starting the motors for running on the 36-pole connection, they will be brought up to about the normal 36-pole speed, and then thrown from the 24-pole to the 36-pole connection. In this way the advantages of the wound-rotor motor for starting and reversing are obtained without the complication of the change-over switches for the rotor, and the six slip rings that would be required if an ordinary two-speed machine were used.

The direction of rotation for either pair of motors will be changed by the reversing switches. The switching apparatus will be arranged so that only the proper levers need be thrown to enable any pair or all the motors to be run from either generator.

One of the most important features of these machines is the method of insulation. Owing to the conditions under which they may have to operate, it was considered essential that the insulation used should contain a minimum of fibrous material. The windings, therefore, have been so designed that only mica is used for insulation in the slots, and any fibrous material used is required only to hold the insulation in position. All the coils will be given a large number of treatments of suitable varnish to seal up all possible inlets for moisture, so that the insulation will be moisture as well as heat-resisting. The construction adopted permits the temperature to be raised to 300 deg. F. without injury to the machine.

For starting the propelling motors, liquid rheostats are used. These are designed to give a fixed rate of acceleration. This type of rheostat gives an infinite number of starting points, and will be arranged to limit the rate of acceleration, and the current drawn from the generators, to any desired amount.

The control gear, beyond the point of space limitation and the necessity of interlocks for making it "foolproof," does not differ materially from an installation on land. The control and switching equipment in a land power plant has developed into a large and expensive part of the installation, in many cases occupying more space than the generating equipment, but on shipboard special care has to be taken to design it to conform to the restricted space available. In this instance the control is so designed that the motors can be started singly or in group, also reversed quickly.

The turbo-generating equipment in the two engine rooms and the four propeller motors will all be controlled from a central control room communicating with the bridge. All operations for the control of the ship will be performed from this room except starting the turbines and the auxiliary machines. In this control room will be placed all the switches for connecting the generators to the motors and control mechanism for the governors. The only connection from the control room to the engine room will be the cables and pipes to the turbine governor, gauge piping, and the shafts of the revolution counters.

All switches and rheostats required for the operation of

the main propelling machinery will be operated by levers mounted in front of the instrument boards. The switching apparatus will give all the combinations that will be required, and will all be manually operated. The various levers will be mechanically interlocked, so as to prevent any improper combinations being made. All the circuits will be controlled by oil switches, which are arranged in a novel manner so that when open for inspection they are entirely disconnected from any live parts. This eliminates the possibility of any danger due to the failure to open disconnecting switches.

In addition to the main generating and propelling equipment, there will be furnished auxiliary direct-current turbo-generator sets for supplying current for excitation of the alternators, light, power, signals, and the several hundred motors used on a battleship for practically all mechanical operations.

Electricity on board ship finds many uses, such as steering, searchlights, raising anchor, baking bread, operating laundry and refrigerating plants, raising big shells from the magazine to the guns, and many others.

The auxiliaries for the engine room will be electrically driven, and for supplying power for the uses mentioned, six 300-kw. geared turbo-generator units will be supplied, four of which are for non-condensing operation, their exhaust steam entering the main turbines at a suitable point.

For varying the excitation of the main turbo-generators, two motor-generator booster sets will be furnished. These booster sets will be capable of "bucking" the excitation to zero or "boosting" the normal 240 volts bus-bar voltage to about 315 volts.

All the propelling machinery for the ship is being built by the Westinghouse Electric & Manufacturing Co. at East Pittsburgh, Penn. Similar equipment is being furnished for the new battleships *Colorado* and *Washington*, now under construction.—*Power*.

ELECTRIC CANOES.

THE *Motor Ship and Motor Boat* for September 6th contains an illustrated article on the electric canoes which have become popular on certain sections of the River Thames. We are indebted to this source for the following particulars.

This form of propulsion has the great advantage of running practically without noise or vibration, while it is perfectly clean to handle, starts with certainty, and requires no mechanical knowledge on the part of the person in charge—important considerations under existing conditions, when crews often consist of girls in summer frocks.

Electric launches have been used on the Thames for many years, and at one time they became very popular, but were more or less ousted by the motor launch, which, before the war, offered higher speeds at a lower cost. The increased price of petrol has altered conditions, with the result that electricity has obtained a new lease of life.

Our contemporary remarks that it is by no means improbable that electric propulsion for pleasure purposes on inland waterways has come to stay, until the small marine motor

M, motor; B, battery; C, seat; W, steering wheel.
FIG. 1.—SECTION OF ELECTRIC CANOE.

has been improved so as closely to approach the electric outfit in smoothness of running and flexibility.

Those accustomed to taking their pleasure upon the water in boats propelled by oars or sails have always complained of the noise and vibration inseparable from the small motor boat, and many such are willing to sacrifice speed to peace and quietness. Another advantage of the electric boat is that it does not appreciably interfere with the enjoyment of those taking their pleasure in skiffs or punts, whereas the ordinary motor launch causes a considerable amount of discomfort to other craft in the way of noise, wash, and smells.

There are few motor engines that can even approach the steady torque and quiet movement of an electric motor.

On some reaches, electric launches are to be found in considerable number, but there is perhaps a rather general impression to the effect that the motor itself and the accompanying storage battery must necessarily introduce so much weight as to be applicable only to the larger craft. For some years past there has, however, been growing in popularity on certain reaches a type of boat that is not as yet generally known. This is the electric canoe, the hull of which is to all intents and purposes that of an ordinary clinker-built

Canadian canoe, somewhat enlarged in all directions without departing materially from the proportions of the model. Additional strength is provided to carry the extra weight, and a deck is formed which extends unbroken throughout the length of the vessel, except for a short space amidships. In this central space is accommodated the electric motor, and sometimes also the battery. There is, of course, very little head room below the deck itself, so that the space there available cannot be used for the accommodation of adequate batteries unless they are specially constructed with short wide plates.

The first electric canoe, which was launched in June, 1908, was built by Messrs. Wilder, at Maidenhead, to the requirements of a customer. The boat was known as the *Viren*, and since that date it has been superseded by other *Virens*, each one showing an advance over its predecessor. The present *Viren* is well over 30 ft. in length, and carries an unusually large battery. This is of the E.P.S. type, and consists of 50 cells rated at 200 ampere-hours. The motor is of the Blenheim type, and is rated at 100 volts, 45 amperes. It is an ordinary two-pole series-wound machine with the field windings on either side, and the poles above and below the armature. The end thrust is taken by a single thrust ball race on the after-end of the armature shaft. The motor can run at 25 per cent. overload without undue heating. Current is supplied to the motor through a simple controller, which provides two speeds forward and reverse. When running at full speed the current consumption is about 38 amperes at approximately 100 volts, and the average speed attained up and down stream is 11 miles per hour. A lower speed is provided by putting the two halves of the battery into parallel, so that in effect it becomes a 50-volt battery with a capacity of 400 ampere-hours. Under these conditions, the speed of the boat is about six miles an hour, and current is discharged at the rate of 25 amperes. On a day's run, the current consumption may work out approximately to be such as to discharge the battery in about eight hours' running time. The present *Viren* is, we believe, the fastest craft of her type on the river, but she certainly runs very silently, and with very little wash up to something approaching her full speed.

For a canoe of 30 ft. or over, there does not appear to be any special object in saving space amidships by putting the batteries under the floorboards. If they are carried in a central position with the motor, the accommodation for passengers forward and aft of the installation is quite adequate. Some people, however, prefer electric canoes which approximate as nearly as possible in size to the ordinary Canadian. In that case, the saving of space becomes important, and the use of short cells under the floorboards is a marked advance. There would be no object, however, in endeavouring to design a motor which can be similarly accommodated, because the central seat backs must be kept far enough apart to ensure that ladies' hats, however generously dimensioned, shall not come into collision across the intervening space. The seating accommodation is peculiarly comfortable, and in this respect is only equalled by the ordinary punt. It consists of large-shaped cushions on the floorboards, and also resting against the sloped seat backs, the angle of which can be varied. Some canoes provide comfortable accommodation for eight passengers, but the lines of others are such that only the central seats are sufficiently roomy to accommodate two each in comfort.

The whole of the control comes directly to the hands of the driver, while leaving him in every respect just as comfortable as his passengers. At one side of him is the controller, providing full and half-speed ahead and full and half-speed astern, as well as a neutral position. On the other side is the steering wheel, mounted vertically near the gunwale, and working through the medium of a small pinion and ratchet, in conjunction with a bent rod connecting to the tiller, as shown in fig. 1.

The majority of the canoes in service in the Maidenhead district have batteries of 30 cells, which are generally adequate for a day's run, unless exceptionally high speeds are desired. In some the motors are of the submersible four-pole type, with separate thrust bearings and special flexible couplings. It is generally found that the positive plates of a canoe battery will last for four years, and the negatives for eight years.

Several of the local boatbuilders have their riverside premises equipped with excellent charging plants. The regular price charged by boatbuilders to boat owners is 1s. per unit.

In the opinion of the writer of the article, the electric canoe is bound to increase very largely in popularity. In time charging facilities will be thoroughly well distributed. Thus, the only limitation of the electric boat on the upper river will be removed, since the batteries can always be charged up every night, and have sufficient capacity for the whole day's run. At present, of course, one cannot depend with certainty on finding suitable recharging facilities elsewhere than in a district where craft of this type are already in use.

The draught of an electric canoe is very small. The system gives the maximum of comfort, is quite free from vibration, and is absolutely silent. It combines, in fact, all the merits that one can want short of a capability for developing enormous speeds. One imagines that the type will not be limited to the Thames, but will presently be found in many other places, its distribution depending partially on the provi-

sion for recharging facilities. Beyond this, it has few limitations. So far as the upper Thames is concerned, the electric canoe bids fair to bring about a revolution in mechanically-propelled craft.

WAR ITEMS.

Big American Electric Signs may be Cut Off.—In order to save coal Mr. Garfield, the American Fuel Administrator, contemplates the abolition of the famous electric signs in Broadway and other big American thoroughfares.—*Times*.

Abusing the Trade Protection Certificates.—At Bermondsey, the Military Representative drew attention to another abuse of the issue of the trade protection certificates, which he characterised as the most flagrant case which had come under his notice. It referred to a man who described himself as a manufacturing chemist. The Tribunal made the most minute inquiries into his claim, visiting the works, and took up a very strong attitude, granting him a final period of exemption. The man took the case to the Appeal Tribunal, where his claim was disallowed, but he had since obtained a trade protection card. At the Appeal Tribunal he maintained that he was making Glauber salts, but, in answer to questions, he was unable to describe the minute details of their manufacture. He was nothing more or less than a glorified commercial traveller surrounded by a halo of verbiage not uncommon to the sect. The Tribunal should protest strongly against abuses like this, especially when engineers and men working in munition factories could not get protection cards. The Military Representative added that some men, if they had the gift of the "gab," could obtain the certificates after they had been turned down by the local and appeal tribunals. The Tribunal decided to communicate with the Government Department and the local officer responsible for issuing the cards, stating that unless there was some alteration in the mode in which the cards were being indiscriminately issued they would consider whether they should not suspend hearing any further appeals.

Exemption Applications.—At the Hampshire Appeal Tribunal, J. J. Vertue (37, married, Class A) applied for further exemption. In June, when two months was granted, he was told to bring a clear statement of his position at the next hearing. A letter was now produced from Captain Mayne, Chief Electrical Engineer, Aldershot Command, stating that applicant's partner, F. Burch, was solely and fully employed by the War Department on electrical services in that command. Vertue said he was now the sole managing director of the business. Captain Morley put in a letter from Major-General G. F. Ellison, in charge of administration, stating that certain work was now drawing to a conclusion. It could not conveniently be put out to contract, and for some time it had been carried out by labour supplied by Burch and Vertue at military contract rates, but it was necessary for the firm to constantly apply to the Tribunal for exemption, and to avoid this Mr. Burch and his men were taken on directly by the War Department. Captain Morley said that there were two partners, and he was asking that one should serve. A further two months was granted, no further appeal to be made without the leave of the Tribunal.

At the Perth Tribunal, the Warden of Trinity College, Glenalmond, appeared on behalf of the electrician at the College, who had previously been temporarily exempted. It was pointed out that the man was a discharged soldier, who had full charge of the electrical installation, and it had been impossible to get a substitute. Conditional exemption was granted.

At Camberwell Tribunal, Mr. J. L. Simon, consulting electrical engineer, of Herne Hill, appeared at the request of the Military Representative to show cause why his certificate of conditional exemption should not be withdrawn. He was 36 years of age, and passed for labour at home (C3). He stated that he was responsible for the running of the electrical plant of seven large water and gas undertakings. His certificate of conditional exemption was confirmed.

At Hastings, exemption held by W. A. Berryman (39, B1), controller examiner to the Hastings Tramway Co., was opposed by the Military Representative. It was stated that the man was now engaged entirely on night work, and that he was not fit for military service. The case was referred to the Special Medical Board.

At Watford, M. J. Connari (Class A), electrician, sought exemption on the ground that he was engaged in a certified occupation, and was the owner of a one-man business. He claimed to be the oldest-established electrician in the town, and put in letters from local firms showing that he was attending to their electric plant. As he was dissatisfied with his classification, the case was referred to the London Medical Board.

At Hove, a Military review was made of the case of the accountant and chief clerk (37, B1) at the Hove electricity works. He is the only male left in the office, but it was

urged by the Military that, having regard to his age and classification, he would be of more use in the Army. For the respondent it was asserted that on account of his health he was not fit for military duties. A fresh medical examination was ordered.

Wigan Tribunal had before them the case of 30 men engaged on the Corporation tramways. Lieutenant Pool stated that he had gone through the list with the manager, Mr. Buckley, and it was decided that three of the youngest men should join up, and that the others should be temporarily exempted until February 1st. This was acquiesced in by the Tribunal.

At Sevenoaks, the Electricity Co. appealed for J. H. Wickenden (31, B 2), cable jointer, and J. A. Shaw (30, A 2), engine fitter, who was invalided home with malarial fever in 1916. The manager stated that they were now running eight-hour shifts with three men. Wickenden was given conditional exemption, and the appeal for Shaw was refused.

In an appeal at Stratford-on-Avon by O. T. Kemp (33), electrician, it was reported that he was working four days per week at the electricity works, and that he had been given a protection card by the Ministry of Munitions. The appeal was respite *sine die*.

At Romsey, Colonel Ashley appealed for the retention of his electrician (28, C 2), and stated that he himself was engaged on War Office work. Exemption until October 1st.

At Reigate, the Surrey Asylums Visiting Committee appealed for J. L. Cochrane (34, B 1), electrical engineer at Netherine Asylum. As he is indispensable, the Military Representative assented to exemption until February 28th.

At Gillingham (Kent), the Corporation electric light department appealed for W. A. M. Paton (19), electrical engineer. Mr. A. D. Chalmers, borough electrical engineer, stated that it had been left to the Military to supply a substitute, and the one sent had had to return to hospital. The Military Representative observed that a number of women were now employed on switchboards, and Mr. Chalmers said: "Can you name one? If the Military authorities supply a substitute, I am quite prepared to let this man go, but if not, and they take him, I cannot guarantee a continuity of supply. This man is not only a switchboard attendant, he is a charge engineer." The Military Representative: I am sorry for the concern if they employ so young a man as charge engineer. Exemption, subject to substitution, was granted.

At Reading, an appeal was made by A. S. Sayers (32, B 3), electrical engineer, trading as the Felgate Electrical Co. He claimed to be in a certified occupation, and that he was more successfully occupied in his present capacity than he would be if he went into the Army. The Military Representative replied that applicant's age took him out of the certified list, and added that electrical engineers were badly needed in the Army. Three months were conceded.

BUSINESS NOTES.

Prohibited Swedish Exports.—The Swedish Government has now prohibited the exportation from the country of all electrical machines such as generators, motors, converters, and transformers, and also parts of such machines, incandescent and arc lamps, carbon and metal filaments, current regulators, telephone and telegraph apparatus, and electro-technical apparatus, such as X-ray machines, wireless telegraphy plant, &c.

Schaffer and Budenberg Shares.—The Public Trustee is inviting offers, under the Trading with the Enemy Acts, for the purchase in one lot of 3,000 ordinary £10 shares in Schaffer and Budenberg, Ltd., Broadheath, near Manchester.

Japanese Development.—An article, contributed to the Japanese Press by a University Professor, states that, as might be expected, the unusually large excess of exports over imports, and the consequent increase of specie in the possession of the nation, tended to stimulate Japanese enterprise to a remarkable extent. The total capital stock of various partnership and joint stock companies projected during the first six months of the present year, including capital increases of existing concerns, is estimated at nearly 560,000,000 yen, which exceeds by more than 100 per cent. similar projected investments during the corresponding period of any previous year. Of the 560,000,000 yen of new capital, nearly 190,000,000 yen are devoted to manufacturing industries, 112,000,000 yen to banking, 56,000,000 yen to mining, 41,000,000 yen to electrical undertakings, while the remainder is distributed among various enterprises engaged in cotton spinning, transport by rail and sea, insurance, business, commerce, &c. *Board of Trade Journal*.

Trade Inquiries.—H.M. Minister at Bogota, Columbia, reports that a British commission agent and manufacturers' representative at Cali wishes to represent a British commission house which could obtain any articles that his clients may require, including small electric motors, lamps, and supplies, to compete with German and American goods. The inquirer states that the trade in electrical goods, though small at present, owing to the fact that electricity has not long been installed in the Cali district, is bound to increase with the development of the country. Applications for his name and address should be made to the Department

of Commercial Intelligence, 73, Basinghall Street, London, E.C. 2. [Reference 322.]

Catalogues and Lists.—CENTURY ELECTRIC CO., St. Louis, U.S.A.—Sixty-four-page illustrated catalogue describing the design, construction, &c., of their single-phase, self-starting motors, $\frac{1}{2}$ to 40 h.p., repulsion start induction type, and illustrating their application to the driving of machines, &c., of many kinds.

NATIONAL X-RAY REFLECTOR CO., Chicago.—Circulars illustrating and discussing their reflectors for industrial electric lighting fittings, also the Curtis lamp adapter.

INTERNATIONAL TIME RECORDING CO. LTD., 57, City Road, London, E.C. 1.—Forty-eight-page publication illustrating examples of Def. Bundy, International and Rochester Automatic Time Recorders, and quoting testimonials of users.

Bankruptcy Proceedings.—WILLIAM PARSONS, 63, Parade, Leamington, late 66, Regent Street, Leamington, Warwick, engineer.—The Receiving Order in this matter was made on the debtor's own petition, and, according to the accounts prepared, the liabilities amount to £452, to meet which there are assets of £37, leaving a deficiency of £415. The debtor commenced to trade as an electrical engineer about 16 years ago, without capital, in partnership with F. E. Brown, at 46, Regent Street, Leamington, under the style of Brown & Parsons. The only capital was about £50 put in by Mr. Brown. The business was removed to 63, Parade, Leamington, after two years' trading, and, after a further three years, a dissolution of partnership took place. The whole of the liabilities and assets were taken over by Mr. Brown, with the exception of about £30 cash, and stock to the value of £100, which the debtor took. With this he immediately started a new business of his own at 66, Regent Street, Leamington, under the style of W. Parsons & Co. Mr. Brown continued to trade under the style of Brown & Parsons, at 63, Parade, Leamington, and in September, 1913, the business having been in the meantime converted into a limited liability company, under the name of Brown & Parsons, Ltd., he asked the debtor to assist in the reconstruction of the business by subscribing his name, with others, as joint and several guarantors of debentures of a new company to be formed for the purpose of taking over the business of Brown & Parsons, Ltd., which thereupon went into liquidation. This the debtor agreed to do without receiving any monetary consideration, and debentures to the extent of £600 were accordingly issued by the newly-formed company (Brown & Parsons (1913), Ltd.), with the debtor as one of four guarantors. At the same time the debtor's business was converted into a limited liability company, under the style of W. Parsons & Co. Ltd., the capital at that time being about £750, and debtor was allotted 750 £1 ordinary shares in the new company. For the purposes of obtaining additional working capital, debentures were issued for £300, and were guaranteed by the debtor and Mr. Brown. In consequence of the liquidation of Brown and Parsons, Ltd., the workmen attached to that business left, and were immediately taken into the employ of W. Parsons & Co., Ltd., and thereafter the whole of the orders received by Brown & Parsons (1913), Ltd., were executed for them by W. Parsons & Co., Ltd., with the result that the former company became indebted to the latter company in a continually increasing amount. The indebtedness amounted to £397 in April, 1915, and, owing to the inability of Brown & Parsons (1913), Ltd., to discharge such indebtedness, and the consequent effect on the business of W. Parsons & Co. Ltd., the position of affairs was placed before the debenture-holder, who commenced proceedings in the Chancery Division of the High Court, these proceedings resulting in the appointment of Mr. A. E. Mason, C.A., Dudley, as Receiver. Within a few days of the commencement of these proceedings, the debenture-holder of Brown and Parsons (1913), Ltd., appointed Mr. Mason Receiver in the matter. A new business was commenced in July, 1914, under the management of the debtor at 84, Tilton Road, Birmingham, under the style of the Birmingham Central Supply Co. for the purpose of carrying on a wholesale trade in electrical fittings, &c. Mr. Brown put in £200, the debtor £120; and the debtor's wife £80. The business was shortly afterwards converted into a limited liability company, under the name of the Birmingham Central Supply Co., Ltd. 120 £1 shares were allotted to the debtor, as consideration for the money provided by Mr. Brown and the debtor's wife debentures to the value of £300 were issued to the debtor's wife, who held them in part as trustee for Mr. Brown. The business was discontinued in 1916, the whole of the trade creditors being paid in full with moneys collected from the book debts. A new company was formed early in 1916, to take over the stock in trade of Parsons & Co., Ltd., Brown & Parsons (1913), Ltd., and the Birmingham Central Supply Co., Ltd., the style of this new company being Parsons & Hodges, Ltd. Debentures were immediately issued by the new company to the extent of £600, with the debtor as sole guarantor. In addition, the debtor became guarantor jointly with Mr. Brown in or about July, 1913, in respect of debentures to the extent of £800 issued by a company known as the Shipston Electrical Co., Ltd., which had been created and was then managed by Mr. Brown. This concern has since been wound up by Mr. Mason as Receiver for the debenture-holders, but the debtor states that it is not probable that any liability will fall on him in respect of this transaction. The debtor attributes his position to guaranteeing payment of debentures issued by Brown and Parsons (1913), Ltd., and W. Parsons & Co., Ltd. He first became aware of his position about six weeks ago, when he received notification that the assets of W. Parsons & Co., Ltd., were insufficient to pay the amount due to the debenture-holder.

PARFITT, G. J. T. J., consulting electrical engineer, Keynsham, near Bristol.—Supplemental dividend, 1s. 6d., payable September 12th, by the Official Receiver, at 26, Baldwin Street, Bristol.

U.S. Electrical Exports to Canada.—Figures are now available showing the foreign trade of Canada for the fiscal year ended March 31st, 1917. The total imports of electrical merchandise during that period were \$6,342,490, as compared with \$4,896,106 for the corresponding period a year previous. Of the 1916-17 total, \$176,700 came from the United Kingdom and \$6,149,342, or 97 per cent., from the United States. While these figures show that virtually the entire amount of Canadian electrical imports originated in the United States, they do not show the extent to which Canada depends on electrical goods manufactured under supervision of interests in the United States. Many of the larger manufacturers in the States have Canadian branch factories where electrical goods for Canadian consumption are produced. The goods are identical with those manufactured in the States. They are made in Canada so as to avoid import duty. *Electrical Railway Journal.*

Trade Announcement.—THE CONSOLIDATED PNEUMATIC TOOL CO., LTD., have taken premises at Egyptian House, 170, Piccadilly, W. 1, as the Government has commandeered their Palace Chambers offices. Telegraphic address: "Caulking-Piccy, London." Telephone: 9215 Gerrard (three lines).

Book Notices.—*Aims and Achievements.* The activities of the Society for Electrical Development, U.S.A., are described in this review of the Society's work which has just been issued. The booklet is a concise digest of what the Society is doing; it describes its endeavours to combine engineering, publicity, merchandising, advertising and field co-operation for the benefit of its membership and the entire industry. A graphic chart, which is a feature of the book, separates this work into three divisions—educational work with the public, investigation and educational work with other trades and industries, and trade development and sales promotion work with the electrical industry itself. In each of these fields the Society is doing important work, along lines not duplicated by any other organisation. Upon request, a copy of the booklet will be sent free to anyone interested. The address of the Society is United Engineering Societies' Building, New York.

"The Journal of the Junior Institution of Engineers" for September contains a list of 253 names of members serving with the Forces, of whom 17 have lost their lives. A useful paper on "Engineers' Non-Ferrous Alloys," by W. Rawlinson, summarises the properties, uses, and compositions of a large number of alloys.

"Electricity and its Applications" (the "Hawkins Electrical Guide") Nos. 1 and 6, New Brighton (Cheshire): Edwin A. Mansfield & Co. Second edition. Price 5s. per volume (10 volumes).

LIGHTING AND POWER NOTES.

Accrington.—The T.C. has appointed a Sub-Committee to inquire into proposed alterations at the electricity and destructor works, the object being to secure the more economical working of the two departments, and to be prepared with a complete scheme to anticipate the demands of the future. Councillor Welch asked, in view of the great losses in the electricity and tramway departments during the past year, approaching £12,000, if it would not be expedient to prepare an interim report as to profit and loss covering the six months from March last; but Alderman Higham, chairman of the Committee, said that a report for six months' working would show a greater loss in proportion than one at the end of the year, as all electricity works lost more or less money in the summer, which had to be recovered on the winter load.

Argentina.—The German Electric Light Co.'s operatives in Buenos Ayres struck on Tuesday night, last week. The Government promptly supplied naval stokers and adequate police protection. *Times.*

Australia.—The Electric Light Committee of the Sydney City Council has decided, by 5 votes to 3, to recommend that the city electrical engineer, Mr. Forbes Mackay, be authorised to visit America and Canada within the next few months, for the purpose of inspecting large electricity supply systems in these countries. It was pointed out that as soon as the necessary plant was obtained extensive additions would be carried out at the power house. The resolution included an item of £500 for travelling and other expenses.

The Sydney Electric Light Committee recently decided to acquire 3 acres of land offered by the Government on which to stock an emergency supply of coal, the present stock in hand being only 6,000 tons, or about two weeks' supply; it was also decided to hold in reserve 20,000 tons of coal, and a siding is to be constructed to enable the railway authorities to convey the coal direct to the new depot. *Sydney Daily Telegraph.*

The Quēanbeyan (N.S.W.) Municipal Council is considering the question of installing an electricity supply system in the town, and a poll of ratepayers is to be taken on the proposal. It is intended to secure a bulk supply of electricity from the Federal Capital power house at Canberra, and the Home and Territories Department has offered to supply for a term of 20 years at 6d. per unit for lighting and 2d. per unit for power, with a minimum charge to the Council of £250.

The South Perth (W.A.) municipal electric lighting scheme is expected this year to show a margin of profit after providing for interest, depreciation, and other charges. The town clerk reported that the Council could save 2d. per unit on the cost of generation by purchasing in bulk from the Perth electricity department at 2½d. per unit; this would enable the Council to supply local consumers at 6d. per unit and still show a margin of profit. The electric lighting account had a credit balance at its bankers of £1,600, and by utilising a portion of this and selling the present meters and unnecessary plant it would be possible to effect the change-over without raising any loan; he urged the Council to make an agreement without delay. *Commonwealth Engineer.*

An Order in Council has been issued authorising the City Electric Light Co., Ltd., to supply electricity within the extended area of the city of Brisbane.

The Buninyong (Vic.) Shire Council has asked the Electric Supply Co. of Victoria to erect a transmission line in connection with the Ballarat undertaking to Buninyong, some 10 miles distant, to supply the town with electricity. The company has informed the Council that it is intended to increase the capacity of the works at the close of the war, but until then it cannot entertain the application. *Tenders.*

Bolton.—**SALE OF FITTINGS.**—The Corporation Electricity Committee passed a resolution in favour of the establishment of a separate staff for dealing with electricity fittings, and a deputation was appointed to confer with the Gas Committee as to carrying out the proposal. At the Town Council meeting it was denied that the Gas Committee had intimated to the Electricity Committee that it should leave the gas offices. Councillor Crowther, however, said that when the Electricity Committee made a similar proposal two years ago, the Gas Committee insulted the former by laying it on the table. It was absolutely necessary that the two departments should be divided; there was considerable feeling between them, and the further apart they were, the better. The minutes were approved. A letter was read from the Bolton, Farnworth, and Horwich Building Trade Employers' Association stating that the Electrical Trade Section of the Association had been informed that the Electricity Committee proposed opening premises for the display of electrical fittings, and submitting that if such a course were adopted it would have a serious effect upon the private trader. No action was taken on the letter.

Bootle.—**PROVISIONAL ESTIMATES.**—At the last meeting of the T.C., the Electric Power and Lighting Committee recommended the approval of provisional estimates amounting to £71,000 to be incurred after the termination of the war on the execution of works and the supply of plant in connection with the electricity undertaking, and that application be made to the L.G.B. for sanction to borrow this amount. An amendment was carried, however, that expert opinion and advice should be obtained before the scheme was entered into.

Bradford.—**MAINS EXTENSION.**—The Electricity Committee has authorised the extension of mains across Harewood Street and along Browning Street, including transformer equipment, at a cost of £600.

Doncaster.—**STRIKE NOTICE.**—Nearly 300 Corporation employes at Doncaster—members of the National Amalgamated Union of Labour—tendered a week's notice on Thursday last week, owing to their demand for an extra shilling a day, in addition to the 8s. per week advance already given, not being met. The men concerned include gas workers, electricity and tramway men, as well as other departments, but not the drivers and conductors of the trams. To grant the demand would cost the town £5,000 per year, and if the grant were made to all the Corporation employes it would cost £8,000, equal to an eight-penny rate. As the notices were handed in despite the fact that the matter had been referred to the Committee on Production, the Corporation decided to take no action.

Dover.—**BULK SUPPLY.**—At a special meeting of the Electricity Committee, a communication from the town clerk of Sutton Coldfield, stating that he was to give evidence before the B. of T. on September 3rd, and asking for the views of the Committee on the subject of electricity supply, was considered. It was decided that he should be requested to state that the Corporation had under consideration the advisability of extending its undertaking by the erection of another station outside the borough, with a view not only of meeting the needs of the existing area at the present time and in the near future, but of supplying a larger area; and to point out the position of the Corporation with regard to the capital already expended, and the detrimental financial result that might accrue in the event of the Corporation not being able to adopt a scheme of this nature.

Eastbourne.—**YEAR'S WORKING.**—The report of Mr. Brydges, the borough electrical engineer, on the last year's operation of the electricity department, shows that the output sold increased from 1,773,737 units in 1915-16 to 1,944,528 units in 1916-17, approximately 10 per cent. The total income for the year amounted to £31,212; working expenses absorbed £16,768, leaving a gross profit of £14,444. After meeting capital charges of £13,601, there remains a net profit of £843, as against a deficit of £911 in the previous year. This satisfactory result has been achieved despite the increase in the price of coal for four months of the year of 20 per cent. for an inferior grade of coal, owing to the great economy effected by the new Ljungström turbine.

Foleshill.—**ELECTRIC PUMPING.**—The Bedworth Waterworks Committee has under consideration a scheme for installing electric plant at the waterworks for pumping purposes.

Gillingham.—**TAR OIL.**—The Electricity Committee has decided to adapt the two engines at the electricity works for use with tar oil, at a cost of about £250. The cost of tar oil being 11s. per ton against the present price of fuel oil of 21s. 3d., the saving to the end of March next would be £700 to £800, after paying for the cost of the apparatus and installation.

Ireland.—**WATER POWERS.**—Some of the Irish local bodies are supporting the request of the Dublin Section of the Institution of Civil Engineers to the Board of Trade Electrical Committee to take steps to ascertain the places in Ireland where water power is obtainable, and the amount of power at each place, together with data giving the volume of water at different times of the year.

At the annual Conference in Limerick of the Irish Municipal Authorities' Association, a letter was read from Mr. J. F. Crowley, suggesting that the Dublin, Belfast, and Cork Municipalities should nominate each a witness to give evidence before the Board of Trade Committee on the extension of electrical power. It was pointed out that the matter was of more importance for small urban districts than for large cities.

WIRING POWERS.—The Association of Irish Municipal Authorities passed a resolution asking that power should be given to municipal authorities having electrical undertakings to wire houses and premises, and to spread the cost of the work over a period.

Launceston.—**PRICE INCREASE.**—Consumers of the Launceston Electric Supply Co., Ltd., recently met to discuss the company's proposal to apply to the B. of T. for leave to charge more than the present maximum price for electricity. The meeting was adjourned for representatives of the company to attend and explain matters.

Leeds.—**WAR BONUS.**—An award of a further 2s. per week war bonus, on top of the existing 7s., to members of the General Workers' Union in the electricity and gas departments of the Corporation, has been extended by the City Council, on the recommendation of the General Purposes Committee, to all Corporation officials and workmen whose salaries or wages do not exceed £250 per annum. It is retrospective to August 1st. Alderman Wilson told the City Council that the Tramway Men's Union officials had agreed to his suggestion that, unless untoward circumstances should arise, the award should be considered final.

London.—**CONFERENCE ON ELECTRICITY SUPPLY.**—The Hammersmith Electricity Committee has received a letter from the L.C.C. referring to the conference held in May, 1915, between its Special Committee on London Electricity Supply and representatives of the City Corporation, Metropolitan B.C.'s, and the London electric supply companies upon the question of the supply of electricity in London, and stating that, in the opinion of its Special Committee, the appointment by the B. of T. of the Electric Power Supply Committee and other circumstances had rendered it desirable that a further conference should be held at an early date, and asking if the Council had any suggestions to make on the subject. The Committee pointed out that for some time past the conference of local authorities owning electricity undertakings in Greater London had been in consultation with the Metropolitan supply companies with the object of formulating a scheme for linking-up, in order to give effect to certain suggestions of the B. of T. The last-mentioned conference was representative of the majority, if not all, of the electricity undertakings in Greater London, and a Joint Committee of the Engineers had a report in course of preparation which it was proposed to present to the conference at an early date. Meanwhile, the Committee had received a letter from the hon. secretary of the Conference inviting the Council to attend a further Conference on September 5th, to consider the following resolution adopted by the Executive Committee of the Engineers' Conference, it being felt that, although the Engineers' Conference was called for the purpose of reporting upon ways and means of giving effect to the suggestion contained in the above-mentioned letter from the Board of Trade, as the Board of Trade had extended the scope of its proposals, the reference to the Engineers' Conference should be extended accordingly, viz.:—That as the Board of Trade Electric Power Supply Committee now sitting has been constituted without any representative of the electrical interests—municipalities, purchasable companies, or railways—in Greater London, it is desirable, in the opinion of the Executive Committee of this Conference, that steps should be taken to place the financial and statutory position of all these electrical undertakings before that Committee.

WAR WAGES.—The Hammersmith Establishment Committee recommends the B.C. to grant the latest award of the Committee on Production of 3s. per week to eight fitters and 1s. 6d. per week to three youths in the electricity department, as from August 1st.

LINKING-UP SCHEME. The Hammersmith, Battersea, and Fulham Councils have decided to submit the matters in dispute between the three Councils with regard to the terms for the proposed interconnection scheme, to an arbitrator to be appointed by the B. of T., whose decision is to be final.

Maidstone.—The T.C. has applied to the L.G.B. for leave to borrow £1,800 for mechanical coal-handling plant at the electricity works. The Ministry of Munitions has granted a priority certificate, and the plant is estimated to save £350 a year.

Oldham.—The latest return of the Corporation Electricity Committee shows an increased output on the corresponding period of last year, a reduction in the coal consumption, the amount per unit being given as 2.95 as against 3.30 lb., and a higher efficiency, 78.67 per cent. as against 78.01.

Portsmouth.—**PRICE INCREASE.**—The Electric Lighting Committee recommends increased charges of 20 per cent.—which will make a total increase of 45 per cent.—for power and heating, and a 10 per cent. increase—making 30 per cent. in all—for lighting, from the end of December.

The Committee has secured the promise of a P. I certificate to enable the work on the new turbine to be carried out with all possible speed.

Rochdale.—Satisfactory progress in the electricity undertaking was reported by Sir James E. Jones at the T.C. meeting. He pointed out that a year ago only four of the eight Lancashire boilers and two of the six water-tube boilers were in running condition, and there were many other troubles; from August to December, 1916, they were only able to give consumers about half the supply they required, and some consumers had to be stopped three and four times a week. He was glad to say this was past history. There were only six stoppages from April to July, and only one since then. During the last seven weeks the works had turned out 50,000 units a week more than a year ago, equal to an increase of 15 per cent., and the total increase since April 1st was half-a-million units. They were still waiting for certain plant, and for months they had been working without any spares, liable to stoppages, and working up to their utmost capacity. It would be early next year before the alterations and improvements showed their full value in economical working. Mr. F. H. Rudd had practically overcome the difficulties, and the Committee unanimously recommended his appointment as chief electrical manager at a salary of £400, rising to £500 in two years. The appointment was approved.

Sheffield.—**NEW PLANT.**—Extensions of mains are to be carried out at an estimated cost of £7,100. Of the total, £5,202 are to be spent in extensions to Messrs. Kayser, Ellison & Co.'s works. A plot of land adjoining the Neepsend power station is to be purchased at £125. The Finance Consultative Committee has approved proposals of the Electric Supply Committee with regard to spending £560,000 on the Blackburn Meadows power station, installing machinery, &c.

Swansea.—The Electric Lighting and Tramways Committee has received a communication from the Amalgamated Society of Engineers, asking that the wages of the engineering employees at the generating station be advanced 3s. per week, in accordance with the latest award. It was decided to grant 3s. per week to two of the men, and to refer the cases of the other three to the Council to decide. The new water-tube boiler about to be erected at the generating station is to be installed in a temporary position pending the Government permission to allow the Corporation to proceed with the main reconstruction scheme, which involves a complete readjustment of the boiler house.

Walsall.—The engineer is to prepare a schedule of the plant at the Wolverhampton Street works about to be placed out of commission, and to advertise for tenders for the purchase of such plant. An appeal is to be made against the assessment of the Wolverhampton Street works, on the ground that since the Birehills generating station commenced to operate, the former station has been over-assessed.

West Hartlepool.—**PRICE INCREASE.**—At a meeting of the T.C. on the 4th inst., a recommendation of the Electricity Committee that the increase recently made in the charges for energy to ordinary consumers should be 15 per cent., instead of 10 per cent., was agreed to.

Wolverhampton.—**LOANS SANCTIONED.**—The L.G.B. has sanctioned the borrowing of £2,064, £56,452, £9,218, £8,387, and £2,000 for the purposes of the electricity undertaking; the Board has also sanctioned loans for £178 and £476 in connection with the same department.

YEAR'S WORKING.—The report of the year's working of the electricity department to March 31st last shows gross revenue £74,732, an increase of £8,778 on the previous year; of this amount, power supply shows an increase of £10,315, while the supply for lighting shows a decrease of approximately £700. After deducting working expenses, there remains a gross profit of £27,796: interest, sinking fund, and income-tax charges absorb £25,669, leaving a net profit of £2,127, which has been carried to reserve, which stood at £14,944 at the end of the financial year. The units sold amount to 17,161,275, as compared with 15,280,697 the previous year, an increase of 1,880,578 units, or 10 per cent. during the year; the equivalent of 15,479 32-watt lamps were connected to the mains, including 572 n.p. additional motors.

TRAMWAY AND RAILWAY NOTES.

Aberdeen.—**YEAR'S WORKING.**—The report of the year's working of the Corporation tramways to May 31st last shows that the total revenue was £100,073, an increase of £5,745 on the previous year. Working expenses amounted to £61,026, an increase of £5,828, and after payment of £27,283 for interest and sinking

fund and other charges, there was a net profit of £8,763, as against £9,697 in 1916 and £11,000 in 1915. Of this £2,921 has been allocated to the relief of rates and £5,842 carried to the reserve account. During the year £623 was expended out of capital, making a total capital expenditure of £369,392. The depreciation and renewal funds stand at £177,666, the sinking fund at £63,241, and the reserve account at £49,113, making a total of £290,020. Mileage run 2,033,793, an increase of 65,178 miles; electricity used 2,543,875 units, an increase of 62,491 units, at an average cost of '839d., as against '841d. in the previous year. During the year 28,623,659 passengers were carried, as compared with 26,593,730 in the previous year.

Anstralia.—According to the *Sydney Evening News*, included in the cargo of the s.s. *Mongolia*, which was sunk, was a large quantity of material intended for use in connection with the Victorian railway electrification scheme. The Victorian Government has restricted its programme for the electrification of the railways, but intends to proceed with certain work on suburban lines, which will be further delayed by the loss of necessary material.

Blackburn.—The Lancashire and Cheshire Tramways Managers' Association has been invited by the Electricity and Tramways Committee of the Blackburn Corporation to hold its next meeting in November at Blackburn, and Councillor Higham (vice-chairman) and Mr. Cowell (tramway manager) have been authorised to make the necessary arrangements.

Bradford.—The tramway service is suffering considerable dislocation, owing to the large number of cars which have to lie up in the sheds awaiting repairs, on account of the shortage of both labour and materials. It is understood that one car has been practically taken to pieces to provide parts for the repair of other cars.

Brentford.—**RATING APPEAL.**—The Assessment Committee of Brentford Union has had under consideration an appeal from the London United Tramways Co. for a reduction of their assessment which was fixed some years ago, and confirmed by the Divisional Court and the Court of Appeal, at the following figures:—Gross, £40,537; rateable, £10,302. The grounds of the company's appeal were depreciation and falling-off in the patronage of the lines. The Guardians' assessor (Mr. R. C. Lowe) reported that the company asked for a great reduction—practically to nil. The Guardians were unable to agree to the new figure. The official statement prepared for the Receiver for the debenture-holders showed that the company had been unable to set aside much for repairs of rolling stock. The consideration of the matter was not concluded.

Glasgow.—**TRAFFIC RETURNS.**—For the first three months of the current financial year of the Glasgow Corporation tramways, commencing on June 1st, the receipts were £348,860, as compared with £308,221 for the corresponding period of last year. The number of passengers carried was 104,380,398, as against 94,543,964 last year.

Manchester.—**TRAFFIC CONGESTION REPORT.**—The City Council, without committing itself to the details of the schemes, has approved the general principle of the report of the Traffic Congestion Committee. Ald. Wilson, who said that nothing could be done at present, because of the Government ban on expenditure, thought the provision of the tramway terminals would be the first step which the Council would be asked to sanction, as it would relieve the traffic in the centre of the city by 50 per cent. Over 13 million more people were carried by the Manchester tramways last year than in the previous year.

Sheffield.—Estimates of proposed schemes are to be considered for the lowering of the road under the Midland Railway Co.'s bridge at Brightside, so as to enable double-decked instead of single-decked cars to be run along this route. Negotiations have been opened with the Urban Electric Supply Co., Ltd., Glossop, for the sale to the company of single-decked cars.

U.S.A.—**ELECTRICAL VEHICLE PROGRESS.**—It is estimated that there are now over 250 industrial electric motor vehicles in use in Washington, U.S.A., a city which has always been regarded as an ideal district for electricies owing to its level and good roads.

TELEGRAPH AND TELEPHONE NOTES.

Canada.—The new Canadian National Press Service will operate 12,000 miles of leased wire, connect Sydney, Cape Breton, with Victoria, British Columbia, and employ 90 telegraphists. By the new organisation Canadian newspapers in the Atlantic and Western Provinces are relieved of dependence upon American news agencies. The enterprise is made possible by the active sympathy of Sir Robert Borden and a Federal grant of \$50,000 (£10,000).—*The Times*.

German News Service.—According to the *Svenska Export*, the dependence of German mercantile interests on Lloyd's for marine information in peace time, and the absolute cessation of this supply since the outbreak of the war, have led to the formation of an organisation intended to provide the necessary informa-

tion independently of British sources. For this purpose, and to free Germany from the network of British submarine cable systems, wireless telegraphy will be employed on a large scale.

Telephoning from a Moving Train.—Successful experiments with a telephone apparatus installed on a railroad car were carried out recently on the Canadian Government Railways, writes the United States Consul at Moncton, N.B., Canada. Reports of the tests state that the communication established was in every way satisfactory, although the train was in motion. There was no difficulty in hearing distinctly every word of the messages exchanged. The experiment was tried on a double-track line where the rails were properly bonded for the block signal system, but it is claimed that equally good results can be obtained on any track where the rails are similarly bonded without regard to the presence or absence of a block signal installation. *T. and T. Age*.

CONTRACTS OPEN AND CLOSED.

OPEN.

Australia.—**MELBOURNE.**—October 10th. Department of the Navy. Pumping plant and equipment for the Commonwealth Naval Dockyard, Cockatoo Island, Sydney. Specifications from the Director of Navy Contracts, Melbourne.

Dublin.—September 13th. Electricity Supply Committee. Supply and installation of one Green's economiser. See "Official Notices" to-day.

Kirkcaldy.—October 2nd. Corporation. Converting plant and switchgear. See "Official Notices" to-day.

London.—**H.M. COMMISSIONERS OF WORKS.**—September 18th. Twelve months' supply of incandescent electric lamps. See "Official Notices" to-day.

Manchester.—September 17th. B. of G. Installation of a telephone system at the offices, All Saints. Particulars from Mr. J. Macdonald, Clerk.

Warrington.—September 19th. Supply, &c., of electrical goods at the Workhouse, Warrington, or Cottage Homes, Padgate. Mr. A. Bottomley, Clerk to the Guardians, Bewsey Chambers, Warrington.

CLOSED.

Bradford.—Electricity Committee. One 800-K.V.A. transformer: Brush Electrical Engineering Co., Ltd.

Kettering.—**U.D.C.** Tenders received for '06 feeder cable, feeder pillar, &c.:—

Siemens Bros. & Co., Ltd.	(accepted)	£1,737
Johnson & Phillips, Ltd.		1,764
Henley's Telegraph Works Co., Ltd.		1,788
B.I. & Helsby Cables, Ltd.		1,790
Callender's Cable & Construction Co., Ltd.		1,827
W. T. Glover & Co., Ltd.		1,839
Macintosh Cable Co., Ltd.	(Incomplete)	1,753
Pirelli-General Cable Co., Ltd.	(Incomplete)	1,103

London.—**HAMMERSMITH.**—Electricity Committee:—

W. H. Bowater & Co., Ltd.—150 tons per week for 12 months of Holly Bank Welsh slack coal, at 21s. 3d. per ton at Shepherds Bush Station, or 23s. 6d. per ton alongside the works in barges.

Repairs to coal conveyor:—

F. Bird & Co.	(accepted)	£59	Lucy & Co.	£79
Cadogan Iron Works		63	Wicks & Dale	80
C. Jenkins & Co.		£89			

Repairs to boiler insulating valves:—

Devrance & Co.	£101	A. Turnbull & Co.	£106
J. Hopkinson & Co., Ltd.		Glenfield & Kennedy	198
	(recommended)	147			

Baths and Wash-houses Committee. Stand-by motor for use in the event of a breakdown:

Marryat & Place	£71	Marshall & Plumtree	£84
Marryat & McNaught	73	Victoria Electric Co.	80
Langdon Davies Elec. Motor Co.		T. Barton & Co.	84
	(accepted)	71	Drake & Gorbam	98
			Rubery, Owen & Co.	£125

Sheffield.—**T.C.** Electricity Department:—

Staveley Coal and Iron Co., Ltd.—2,000 four-inch c.i. cable pipes.
British Electric Plant Co., Ltd.—Two 6-stage centrifugal boiler feed pumps.

Sunderland.—**T.C.** Fairgrieve & Co.—Rewinding armature of 250 kW. motor generator at Dunning Street Works.

Wolverhampton.—Corporation Electricity Committee:—

Alley & McLellan.—Valves for pumping plant, £226.
Rees Roturbo Manufacturing Co., Ltd.—Two motor-driven pumps, £384.
Electric Construction Co., Ltd.—Motors for new plant, £1,272.
Film Cooling Towers, Ltd.—Cooling towers, £5,144.
John Spencer, Ltd.—Steam feed water pipes, £280.

FORTHCOMING EVENTS.

Institute of Metals.—Wednesday, September 19th. At 4 p.m. At Burlington House, Piccadilly. Annual autumn meeting.

Iron and Steel Institute.—Thursday and Friday, September 20th and 21st. At 10.30 a.m. At the Institution of Civil Engineers, Westminster, S.W. Annual meeting.

Municipal Tramways Association (Inc.).—Thursday and Friday, September 20th and 21st. At 11 a.m. At the Savoy Hotel, Blackpool. Annual general meeting.

NOTES.

The Evening Press and Industrial Unrest.—We have heard a great deal during the past six months concerning industrial unrest. The Government, after investigating the causes by means of District Committees, decided to adopt certain measures designed to remove them. We think it is a great pity, therefore, that irresponsible evening newspapers, which probably would have far smaller circulations but for their efforts to be sensational, are allowed to publish disturbing announcements respecting new and drastic National Service schemes which will "rope in" every man not already with the Forces. Premature and unofficial statements of this kind, which are officially contradicted in the next morning's papers, should be deprecated most strongly. The Censor is very particular about some things—Why does he allow this?

National Insurance (Unemployment) Acts, 1911-1916.—The following is a further decision of the Umpire. Contributions are payable in respect of:—

2,387 X. Workmen engaged in attending automatic machines for welding wire together to form the reinforcement for concrete.

Educational.—UNIVERSITY OF LONDON, Goldsmiths' College, New Cross, S.E.—Engineering Department. The new session commences Monday, September 24th. Full particulars are given in our advertisement pages to-day.

BATTERSEA POLYTECHNIC.—The new session opens on September 25th. Special classes are provided for the training of men and women munition workers, courses for women in engineering tracing, and free courses for disabled soldiers and sailors in engineering, electrical testing and switchboard work, &c.

Copper for Cables.—With regard to the regulations issued by the Ministry of Munitions Priority Department, dated June 2nd, 1917, governing the manufacture and supply of insulated copper wire and cables, the arrangement made by which for a period of three months a monthly ration of copper for insulated wire or cable for repairs and maintenance for definite classes of work was placed in the hands of the Cable Makers' Association for distribution, came to an end on August 31st. Since this arrangement was made, the Copper Department has allowed copper to be supplied for repairs and maintenance to industrial machinery under the customer's own "B" certificates.

The Cable Makers' Association therefore suggested to the Priority Department that it would simplify matters to discontinue the rationing arrangement, and we are informed by Mr. Llewelyn B. Atkinson, secretary to the Association, that this procedure has been adopted.

Lead: Ministry of Munitions Order.—Last week, says the *Times*, the Minister of Munitions gave notice of his intention to take possession as from September 1st until further notice of all pig lead, whether virgin or remelted, old and scrap lead, and lead residues, situated in the United Kingdom, excepting all such lead as may be in the possession of or due under an existing lawful contract in writing for future delivery to a manufacturer for use in such manufacturer's own works, and all such lead as may be specially excepted under the written authority of the Minister of Munitions. The lead of which possession is taken until further notice will be paid for by the Minister of Munitions on delivery. A full copy of the Order will be found in the *London Gazette* for September 7th.

Factory Operations Delayed by Workers.—At Smethwick, on September 6th, several men, by occupation ash-wheelers and bunker men, were summoned at the instance of the Shropshire, Worcestershire, and Staffordshire Electric Power Co. for neglect of work. According to the *Birmingham Post*, Mr. Chapman, for the prosecutors, explained that the men absented themselves from work on various days in August, and the resultant loss was no less than £300. On one occasion the conduct of the defendants resulted in six or eight large works being compelled to stop, and 1,000 hands were unable to work. Defendants contended that on occasions seven men had to do the work of nine, and they were not physically capable of doing it. The magistrates ordered each defendant to pay £5 damages and 12s. costs, remarking that discipline must be maintained. It was stated that if the men returned to work and worked regularly the company would sympathetically deal with the question of damages.

Belfast Electrical Strike Ended.—At a recent sitting of the General Munitions Tribunal for Belfast and North-East Ireland, the Belfast Corporation summoned 32 employees in the electricity department for alleged contravention of the Munitions of War Act, 1915, by taking part in a strike in connection with

a difference as to terms or conditions of employment, without such differences having been reported to the Board of Trade and 21 days having elapsed from the date of such report, and said differences not having been during that time referred to the Board of Trade for settlement.

Mr. A. J. Lewis, who appeared for the Corporation, explained that, in the opinion of the Corporation, the case was, perhaps, the most serious that had come before the Tribunal since it was called into existence. The 30 defendants were employed in the electricity or the electric power department of the Corporation. That was a separate and distinct department of municipal enterprise, with management of its own, and with internal arrangements of its own. It was not pretended by the men that they had any grievance or any cause of complaint against the Corporation. Their wages were good, their hours of labour reasonable, and their periods of rest abundant. They formed the idea, however—a wholly erroneous idea—that other employees in the Corporation, employed in an entirely different department—namely, the tramway department—had a grievance; and although they had no cause of complaint themselves they had, in sympathy with the grievance of other men, thrown down their tools at a moment's notice and gone out on strike. A constant supply of electricity was necessary not merely for the lighting of the immense industrial works in the city, but many of them were driven by that power, and, of course, if it was withdrawn, the consequences might amount to almost a catastrophe. He did not need to point out how much greater the catastrophe would have been in France and Flanders if the supply of munitions were diminished in the slightest degree. The only notice the men gave was in a telegram that was addressed to the Town Clerk, City Hall, and sent at 11.30 p.m. on August 23rd, which stated:—"All members of Electrical Trades Union are on strike as from 6.30 a.m., August 24th, owing to tramway manager's action in reducing wages." That was clearly in contravention of the Act, which provided that they must report their differences to the Board of Trade and allow 21 days to elapse from the date of such report.

Mr. T. W. Bloxam, manager of the electricity department, gave formal evidence.

After an adjournment and consultation, Mr. Lewis announced that the Tribunal would not be further troubled with the case, as the defendants had agreed to go back to work unconditionally.

The order of the Court was that the men should go back to their work that morning, and continue at their work until such time as their cases were finally disposed of by the Tribunal. The personal undertaking of the men to this effect was accepted.

Electric Signals for Constables.—In the crypt at Leeds Town Hall on Thursday last week, a demonstration took place, before the superintendents, inspectors, and sergeants of the Leeds Special Constabulary, of an electrical signalling apparatus for constables on point duty at night. The inventor is Mr. Whiteside, electrician at the Grand Theatre, who is himself a special constable. It is a light dry battery, strapped to the lower part of, the back by a belt, with cross-over straps in front. From the battery three flexible wires run, one to a red electric bulb in the centre of the shoulders at the back, to safeguard the constable at the rear, and the two others to the hands, one of which carries a red light and the other a white one, so that the constable may hold up traffic with the red and wave traffic forward with the white. The wires to the hands are attached to two metal rings on the thumb and forefinger, which, when brought into contact, light a metal filament bulb in the centre of the hand. Six of these outfits are to be supplied for special constables on point duty during the first of the dark evenings now approaching, and, if the trial is successful, the system is to be applied to the regular police.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—

Officer for the Week.—Second Lieut. E. A. Ullman.

Monday, September 17th.—Technical instruction (searchlight) for No. 3 Company, Right Half Company, at Regency Street. Drill, No. 3 Company, Left Half Company. Signalling Class, 6.30. Recruits' Drill, 6.30.

Tuesday, September 18th.—Physical drill and bayonet fighting.

Wednesday, September 19th.—Drill and elementary bridge construction, for No. 1 Company, Left Half Company.

Thursday, September 20th.—Drill and elementary bridge construction for No. 2 Company, Left Half Company. Signalling Class, 6.30. Ambulance Class, 6.30.

Friday, September 21st.—Technical instruction (searchlight) for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Recruits' Drill, 6.30.

Sunday, September 23rd.—Commandant's Parade for technical instruction at Esher. Parade at Waterloo Station, 8.45 a.m., opposite No. 10 Platform. Uniform, haversacks, and water-bottles to be worn. Mid-day rations to be carried. Compulsory for "A" and "B" men.

(By order) MACLEOD YEARLEY, Capt. and Adjutant.

Tramway Allotment Holders.—A successful show of allotment produce was made by the employees of the Bradford city tramways. There were two sections, one for the produce of experienced gardeners and the other for war-time allotment holders only. There were 132 entries in the one and 131 in the other. Much good produce was displayed. The lady supervisors of the tramways provided a special prize in the shape of a rose bowl, and other prize-givers were Sir James Hill, Bart., M.P., and Mr. C. J. Spencer, the tramway manager. The show was opened by Mr. Enoch Priestley, chairman of the Tramways Committee, and all the produce was subsequently sent to the local war hospital.

Exports to China.—The *London Gazette* for September 11th contains names of further bodies and persons to whom exports to China may be consigned.

Lightning Storm.—On Wednesday evening last week an electric storm of exceptional violence was experienced in London and the surrounding districts. The lightning played in vivid flashes for four hours, and was accompanied by heavy peals of thunder and torrential showers of rain. Floods resulted in the S.W. area, and caused much damage to houses and gardens. Several buildings were struck by lightning.

Appointments Vacant.—Station engineer (60s.) and engine driver (40s.) for the oil-driven power station in the Northern Command; assistant (temporary) to take charge of the medical electrical department, including installation work, of the Royal Baths, Harrogate; chief assistant engineer (£230) for the Chesterfield Corporation Electricity Department; assistant lecturer and demonstrator in electrical engineering (£200) for the Battersea Polytechnic. See our advertising pages to-day.

Our Commercial Intelligence.—The Council of the Association of Chambers of Commerce of the United Kingdom regard the proposals put forward by the Board of Trade and the Foreign Office on commercial intelligence as a "compromise," which, while open to objection, is a step in the right direction. They hold that it affords a foundation upon which other reforms may be based, and that it does not preclude development in the direction of a Ministry of Commerce.

Chambers of Commerce and Banking.—According to the *Times*, the Council of the Association of Chambers of Commerce has passed a resolution urging that as the revision of the charter of the Bank of England is likely to come before Parliament in the near future, the operations and functions of the Bank of England should be referred for investigation by a Government Committee appointed for the purpose of inquiring into the position of the Bank—(a) As the national bank of the Empire; (b) as a possible closer co-operator with the banking institutions of the country in promoting trade and commerce at home and overseas.

Coal Prices.—An Order has been prepared by the Controller of Coal Mines for the purpose of regulating the charges made by coal factors and merchants. The prices chargeable by the owner of the coal at the pit's mouth are already controlled by the Price of Coal (Limitation) Act, and factors' and merchants' charges have for the past two years been the subject of voluntary arrangement between the merchants and the Board of Trade or local authorities, which have, on the whole, been successful in maintaining prices at a reasonable level. In certain cases, however, the number of which is not large, relatively speaking, complaints have been made from which it is clear that excessive charges have been made, and the Controller of Coal Mines has taken the opportunity afforded by the introduction of the Coal Transport Reorganisation Scheme on Monday last to cancel all contracts for coal for inland consumption on that date, so that there shall be a general review of colliery companies' and wholesale merchants' prices.

For the purpose of this review of prices, the Controller has addressed to the collieries a series of instructions dealing with certain points which have from time to time been the subject of disputes between sellers and purchasers, and the Wholesale Coal Prices Order issued on September 5th specified the maximum charges which factors and wholesale merchants shall in future be entitled to make.

Particular attention is called to the fact that in order to avoid interruption of supplies as a result of the general cancellation of contracts, it is laid down in the Order that deliveries shall in all cases continue precisely as if the contract were in existence. It is also provided that in no case shall there be any increase in price without the consent of the Controller.

The Order referred to above contains the following provisions:—

1. The price at which a factor or merchant may sell coal in railway wagon or large load, or cargo, to a consumer or to a retail coal merchant for resale by him to consumers shall, except as hereunder provided, not exceed the pit price chargeable by the owner of the mine at which the coal was produced, or in the case of washed fuel, the price chargeable for the fuel at the washery by the owner of the fuel by whom, or on whose behalf it was washed, in addition to the actual cost of transport (in which cost no charge shall be made by the seller of the coal in respect of the office expenses, salaries, or other overhead charges or loss in handling) by more than the following amounts:—

Coal purchased by railway companies in Great Britain (not for consumption on locomotives)	6d. per ton
Coal consumed in national factories	6d. "
Coal consumed in gas and electric supply undertakings in Great Britain	9d. "

All coal sold for consumption in Ireland, 1s. 3d. per ton. Where coal sold direct to a consumer not having rail or wharf accommodation, who makes his own cartage arrangements, is delivered in railway wagon by the factor or merchant in quantities less than 30 tons, the amount chargeable in addition to the price at pit or washery, and the transport charges as above defined, shall be 2s. per ton, unless the consumer has ordered not less than 500 tons of the coal in question for delivery over the following 12 months.

Where coal is dealt with by more than one factor or merchant before reaching the consumer or retail merchant, the above amounts shall be divisible between the different factors and merchants; and each seller shall at the time of the sale inform the purchaser how much of the above amounts is included in the price, in order that the maximum price may not be exceeded.

In the case of washed fuel, where loss of weight in transit is borne by the factor or merchant, a charge may be made by the

factor or merchant in respect of such loss by way of addition to the price per ton at which the fuel is sold to the consumer, not exceeding in any case 2 per cent. of such price.

Where payment is not made by the consumer or retail merchant before the date on which payment is due to the original owner of the coal, or within 30 days of delivery of the coal, whichever is the later, the factor or wholesale merchant may make a reasonable charge in respect of credit to the consumer or retail merchant.

The maximum charges specified in this article, including the transport charges, may be increased or reduced by the Board of Trade, either generally or as respects any particular class of business, or any individual contract or sale.

2. All contracts for the purchase or sale of coal in the United Kingdom under which deliveries were being made, or were due prior to September 10th, 1917, are hereby abrogated, provided that notwithstanding such abrogation, the seller shall continue to deliver to the purchaser, and the purchaser shall continue to receive, the coal during the period of the currency of the contract, and under the conditions and at the rates specified thereunder unless otherwise agreed by both parties, and the price charged as from September 10th, shall not exceed the price chargeable under the contract in accordance with the provisions of the Price of Coal (Limitation) Act, and of this Order; provided also that in no case shall the price be increased without the consent of the Controller of Coal Mines. Any party to such contract may apply to the Controller for the variation of or relief against any term or condition of such contract, and such application shall be heard and determined by the Controller.

7. If any person acts in contravention of this Order, or aids or abets any other person in doing anything in contravention of this Order, that person is guilty of a summary offence against the Defence of the Realm Regulations.

"Some Engineer."—The following conversation was overheard by a "REVIEW" peruser:—

Man Porter: "So you're leaving on Monday, are you?"

Boy Porter (age about 14): "Yes, I'm going to ———" (mentioning a well-known firm of engineers).

M.P.: "What are you going as?"

B.P.: "An Electrical Engineer!"

To this incident we may add a quotation from the *Daily Mail* of Tuesday last—a foot-line to a portrait of a boy with a pair of wire-cutters:—"ELECTRICAL ENGINEER, AGED 15." This small South Wales lad, who is only 15 years of age, is earning full man's wages as a war-time expert electrical engineer." *Expert*, forsooth!

When will the lay Press and the public learn the difference between an engineer and a mechanic? The popular view still appears to be that an engineer is a manual worker, more or less skilled in the use of tools and the running of machines, and the public readily grants the title to anyone who claims it: one might as well style a dispenser a physician, or a lawyer's clerk a barrister.

An engineer works with his brains, designing, constructing, or erecting works of public utility, to which experience and special training are indispensable preliminaries, and, apart from cases of exceptional genius, we hold that no man under the age of 22, at the very least, can possibly substantiate a claim to the title.

Natural Gas in Italy.—Pisa is now lit with natural gas, a large supply of good quality having been found some two miles from the town. The shortage of coal in Italy makes the discovery especially welcome.—*The Times*.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—In compliance with a request from the Coal Control Department, the Committee have authorised the Bradford city electrical engineer, Mr. C. ROLES, to render part-time service to the Coal Controller in waiting upon local authorities in Yorkshire, with the object of discussing possible fuel economies, the position being honorary.

The *Commonwealth Engineer* states that Mr. ASHTON BREMNER, electrical engineer, has been appointed engineer-in-charge of the New South Wales Government electric power supply scheme at Newcastle.

The South Shields F.C. has granted the following increases of salary:—The tramways manager (Mr. J. C. WHITLEY), from £300 to £400; assistant engineer of the tramways department (Mr. F. R. BATTY) from £3 5s. to £4 per week; electrical stations superintendent, from £220 to £245; electrical mains superintendent, £220 to £245; chief clerk in electricity department, from £175 to £200.

The marriage took place, at Kettering Parish Church, on September 5th, of CHARLES PERCY SECKHAM, mains assistant at Wakefield, to Lucy Neale Mander, of Kettering.

General.—Mr. W. A. CHAMEN presided at the inaugural luncheon of the Cardiff Rotary Club recently. Mr. A. HOME-MORTON, president of the London Rotary Club, was one of the

speakers. Mr. Chamen announced that at future meetings the addresses would include one by himself on "Electrical Power Supply as a National Asset," and one by Principal Coles on "Technical Education."

Ald. G. T. JACKSON, who has intimated his intention of retiring from the Salford Town Council, owing to ill-health, is the general secretary of the Tramway and Vehicle Workers' Association, which he was instrumental in forming in 1889. At that time tramway men were working 80 and 100 hours a week for a wage of 21s. to 23s. He was elected to the Town Council in 1893, and was one of the pioneers in securing the municipalisation of the tramways service of the borough.

On Monday last, at a meeting of the employés of the Sterling Telephone & Electric Co., Ltd., Mr. GUY BURNEY, the managing director, founder and president of the Sterling Athletic and Social Club, was presented by Mr. Gordon Lloyd, the chairman of the Executive Committee, on behalf of the members, with a chaste silver and ebony tablet, bearing the following inscription:—"Presented to Guy Burney, Esq., President of the Athletic and Social Club, in grateful recognition and appreciation of his efforts as Founder of the Club."

Roll of Honour.—Second-Lieutenant MARSHALL, R.E., formerly a draughtsman at the South Shields electricity department, has been accidentally killed in a motor accident while on duty.

Private JOHN KINSEY, K.O. Royal Lancasters, who has died from wounds, was employed at Blackpool Corporation electricity works.

Signaller LEWIS FOSTER, Warwickshire Regiment, who has been killed in action, was employed at the tramway offices, Bolton.

Private D. CLARK, Loyal North Lancashire Regiment, who has been wounded, was employed in the office of the Darwen Corporation tramways manager.

Private J. GILLIBRAND, L.N.L. Regiment, aged 31, who was employed with the United Electric Car Co., Preston, has been killed in action.

The D.C.M. for exceptional bravery on the battlefield in Flanders, has been awarded to Corporal FRANCIS HIRST, R.F.A., who was an electrician in the Blackpool Corporation tramways department.

Lieutenant F. HARRIS, of the Tanks Corps, who has lost his left arm and right leg, was an electrical engineer.

Sapper A. SMART, R.E., who has died of wounds, was an electrician, employed at the Victoria Picture Palace, Manchester.

Private J. MITCHELL, King's Own Royal Lancaster Regiment, who has been killed, aged 20, was employed as an electrician by Mr. G. L. Adamson, electrical engineer, Rochdale.

Private J. HORNBY, R.E., who has been wounded, was employed as an electrician at the works of the United Alkali Co., Thornton-le-Fylde.

Fitter-Sergeant SMITH, R.F.A., who has been awarded the Military Medal for devotion to duty, was in the employ of the Liverpool Corporation electric light department.

Lance-Corporal CLIFFORD GARLAND, S.M.R.E., accidentally killed in France, aged 22, served his time with Messrs. Rouch and Penny, electrical engineers, Bristol.

Corporal FARRINGTON, King's Lancaster Regiment, formerly on the Southport Corporation tramway staff, has gained the Military Medal for gallantry in the field.

Gunner E. ROUNCE, R.A., an electrician on the staff of Mr. Newbald, Epsom, has fallen in action.

Second-Lieutenant E. B. GREENHOUSE, R.F.C., who has fallen in action, belonged to Bishop's Castle (Salop), and was an electrician.

Private W. WHAPSHOLT, Labour Company, attached to the R.W. Surrey Regiment, who has been killed in action, was with the County of London Electric Supply Co., at City Road.

Lance-Corporal J. RADBONE, Oxford and Bucks Light Infantry, who was on the staff of the Oxford Electric Light Co., has fallen in action.

At Norton Barracks, last week, Corporal C. RIPP, R.E., was presented with the Médaille Militaire. While in charge of his wireless sub-section with a Naval Division, Corporal Ripp made four successful trips under heavy shell fire from the wireless station to the neighbouring dump to obtain further supplies of stores required for immediate use at the wireless station. By this means the station was kept in action, and a message was successfully transmitted by wireless when all other action had failed. This message was promptly acted upon and reserves were brought up in time to render valuable assistance to the infantry holding the trenches, which were heavily counter-attacked at the time.—*Birmingham Post*

Second-Lieutenant F. G. MOTTERSHAW, Sherwood Foresters, wounded and suffering from shell shock, was employed by Messrs. Charles Macintosh & Co., Ltd., Manchester.

Signaller J. FRICHAM, R.F.A., previously reported missing, is now officially reported drowned at sea whilst coming home on leave. He was an engineer employed by the Phoenix Dynamo Manufacturing Co., Bradford.

Sergeant D. BENNETT, a conductor on the Glasgow Corporation tramways, has been awarded the D.C.M. for conspicuous conduct and gallantry on the field.

Will.—The late Mr. WILLIAM MESGRAVE, Grange-over-Sands, formerly of Bolton, engineer, left £119,771.

NEW COMPANIES REGISTERED.

Rotasphere Co., Ltd. (148,393).—Private company. Registered September 4th. Capital, £5,000 in £1 shares. To take over the business carried on at 82, Belvedere Road, Lambeth, S.E., as the Rotasphere Co., and to carry on the business of electrical, hydraulic, motor, and general engineers, &c. The subscribers (each with one share) are: Louis B. Cousans, 82, Belvedere Road, S.E.1, engineer; Robert V. Holliday, The Haven, Kinsdale Road, Peckham Rye, S.E.15, engineer. The first directors are Louis B. Cousans and Robert V. Holliday. Registered office: 82, Belvedere Road, S.E.1.

Rapid Electric Arc Welding & Engineering (Ireland) Co., Ltd. (4,493).—Private company. Registered in Dublin on September 4th. Capital, £5,000 in £1 shares (1,000 pref.). Objects as title. Agreement with J. L. Gordon. The subscribers (each with one share) are: J. L. Gordon, Castle Street, Liverpool, electrical welder and engineer; Ed. R. Hoskinson, 22, Walter Street, Liverpool, solicitor. The first directors are: J. L. Gordon and T. McKinty. Registered office: 45, Rosemary Street, Belfast.

Automatic & Electric Furnaces, Ltd. (148,419).—Private company. Registered September 7th. Capital, £2,000 in £1 shares. Manufacturers of and dealers in furnaces, plant, and materials for the hardening or other treatment of steel and other metals, &c. Agreement with L. W. Wild and E. P. Barfield. The subscribers (each with one share) are: E. P. Barfield, Porlock, Athanum Road, Whetstone, Middlesex, electrical engineer; G. J. Anderson, 36, Barnsdale Road, Maida Hill, W., solicitor's clerk. The first directors are: E. P. Barfield (managing director), and such others as the shareholders may appoint. Registered office: 6, Old Queen Street, S.W.

Wholesale Battery Co., Ltd. (148,408).—Private company. Registered September 5th. Capital, £100 in £1 shares. Electricians, engineers, &c. The subscribers (each with one share) are: W. A. S. Hellyar, 8, Paternoster Row, E.C.4, gentleman; S. Anderson, 58a, Sydenham Road, North Croydon, electrical engineer. The first directors are to be appointed by the subscribers. Registered office: 14, Derby Road, Croydon.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Electric Holdings, Ltd.—Trust deed dated August 22nd, 1917, to secure £1,243,300 10-year prior lien stock, constituting a first charge on £675,000 4 per cent. debenture stock, 313,397 preference shares of £2 each, 54,121 ordinary shares, and 500,000 deferred shares of 1s. each of the British Westinghouse Electric & Manufacturing Co., Ltd., and a floating charge on the company's undertaking and general assets. Trustees: City Safe Deposit & Agency Co., Ltd.

W. F. Smith & Co. (1907), Ltd.—Mortgage debenture dated August 9th, 1917, to secure £250, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Mrs. E. Smith-Cleburn Peel, I.O.M.

A. Reyrolle & Co., Ltd.—Memorandum of satisfaction to the extent of £7,800 on June 30th, 1917, of debentures dated June 6th, 1907, to July 12th, 1912, securing £15,300 has been filed.

Seear, Scott & Co., Ltd.—Particulars of £1,500 debentures created August 28th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £1,500. Property charged: The company's undertaking and property, present and future, including capital. No trustees.

British Electric Tanning Syndicate, Ltd.—Mortgage dated August 28th, 1917, to secure £1,500, charged on tanyard, house, land, &c., Swimbridge, Devon. Holders: J. C. Smith and W. H. Smith.

White, Jacoby & Co., Ltd.—Issue on August 30th, 1917, of £450 debentures, part of a series of which particulars have already been filed.

Chile Telephone Co., Ltd. (29,252).—Capital, £360,000 in £5 shares. Return dated August 2nd, 1917. 66,000 shares taken up; £220,000 paid; £110,000 considered as paid. Mortgages and charges: Nil.

John Davis & Son (Derby), Ltd.—Capital, £35,000 in 20,000 ord. and 15,000 pref. shares of £1 each. Return dated July 5th, 1917. 15,000 ord. and 11,000 pref. shares taken up; £26,000 paid. Mortgages and charges: Nil.

Consolidated Electrical Co., Ltd. (77,054).—Capital, £125,000 in 15,000 pref. and 110,000 ord. shares of £1 each. Return dated July 10th, 1917. All shares taken up. 5s. per share called up on 109,243 ord., £1 per share on 757 ord., and £1 per share on 15,000 pref.; £43,067 15s. paid; £81,932 5s. considered as paid, being 15s. per share on the said 109,243 ord. shares. Mortgages and charges: Nil.

CITY NOTES.

Victoria Falls and Transvaal Power Co., Ltd.

The report to December, 1916, gives the issued share capital at £3,000,000, and the debenture capital at £4,237,840, a further £75,680 of the 5½ per cent. second mortgage debentures and £152,100 of the 5 per cent. first mortgage debentures having been purchased or drawn for redemption during 1916. The net earnings for the year were £800,026. After providing for interest and premium on debentures (£239,706), and for depreciation and income-tax (£305,713), £251,607 remains as net profit, together with £161,568 brought forward, leaving a total

of £416,175. Of this £150,000 has been transferred to reserve fund, leaving £266,175. In respect of this balance, a dividend of 6 per cent., less income-tax, on the preference shares for the year 1916 was paid on January 8th, 1917, absorbing £93,000, leaving a surplus of £173,175. On June 21st, 1917, a dividend of 5 per cent., less income tax, on the ordinary shares for the year ended December 31st, 1916, was declared, and as the preference shares are entitled to share *pro rata* with the ordinary shares in the surplus profits distributed until the preference shares have received a total dividend of 10 per cent. for the year in respect of which the distribution is made, the directors at the same time declared a further and final dividend of 4 per cent., less income-tax, on the preference shares in respect of 1916. The above dividends (paid on July 9th) absorbed £100,750, leaving a balance to the credit of the profit and loss account of £72,425, which will be carried forward. Since the last report there has been no additional generating plant installed in the company's stations. All the plant has been in commission, and has been maintained in an entirely satisfactory manner.

Annual meeting: September 21st, London.

Russia.—The Russian General Electric Co. closed its 1916 working year with a net profit of 2,803,838 roubles, against 2,238,371 roubles in the preceding year, and will pay 1,200,000 roubles in dividend, as last year, making 10 per cent. The board consists of E. Shaikevich (president), G. Bloch, A. Dreier, A. Holstaub, N. Koksharoff, V. Morzhitsky, and N. Dmitrieff.

Stock Exchange Notice.—Application has been made to the Committee to allow the following to be quoted in the Official List:—

Anglo-Portuguese Telephone Co., Ltd.—150,000 shares of £1 each, fully paid, Nos. 1 to 150,000 (special application).

Folkestone Electricity Supply Co., Ltd.—Interim dividend, 6 per cent. per annum, less income-tax, on ordinary shares for the half-year.

Gandy Belt Manufacturing Co., Ltd.—Interim dividend, 20 per cent. per annum, less tax, on the ordinary shares for the half-year.

Bromley (Kent) Electric Light & Power Co., Ltd.—Interim dividend, 4 per cent. per annum, less tax, on ordinary shares for the half-year.

Chloride Electrical Storage Co., Ltd.—The report for the year ended March 31st shows, after making provision for depreciation and for the reduction of investments to market value and for war taxation, a profit of £35,459. Dividends amounting to 10 per cent. have been paid, free of income-tax, on the ordinary shares, and the directors now recommend a transfer of £20,750 to reserve fund, making £22,500, carrying forward the balance, £15,325.—*Financial Times*.

Brotherton Tubes & Conduits, Ltd.—Annual report shows a profit of £5,613. The credit balance of £3,030 brought down was increased to £6,770, but the directors are unable to deal with it owing to the accounts not yet having been passed by the Ministry of Munitions.

Cape Town Consolidated Tramways & Land Co., Ltd.—The report for 1916 states that the profit and loss account shows a debit balance of £631, as against £817 for the previous year.

Companies to be Struck Off the Register.—The following companies are to be struck off the register and dissolved unless cause to the contrary is shown within three months:—

Adjustable Cover & Boiler Block Co.
Forced Lubrication Co.
South African Engineer Co.

Dumbarton Burgh & County Tramways Co.—Dividend of 3½ per cent. on the ordinary shares for the year.

STOCKS AND SHARES.

TUESDAY EVENING.

THE most depressing factors in Stock Exchange markets for the time being are naturally Russia and Sweden; but from the point of view of actual influence over prices, the steady demand from the public for industrials is considerably more potent. There is little doubt, however, that the Russian and Swedish developments have the effect of stopping business amongst investment stocks, although, even here, the amount of trade which is being done is surprising enough, having regard to the news from the Riga region. But Stock Exchange markets are throwing off much of that feeling of

sympathy which in the old days used to permeate everything, and which made Kaffirs weak if Consols happened to fall ½ and produced dulness in Brazil Traction if there were a momentary break in Yankees.

Mexican stocks and shares of all kinds have undergone something of a shake-out after their big rises. It is said that the loan negotiations, whereby the United States is understood to have in contemplation the advance of a substantial sum to Mexico, are proceeding satisfactorily. But, on the other hand, the fresh outbreak of internal disorder, as evidenced by the assassination of a band of Carranza's soldiers at the end of last week, is not exactly a bull point for Mexican securities of any kind.

It must be remembered, too, that Mexicans had gone ahead very fast beforehand; and those of us who considered the rise was being overdone, in view of the continued uncertainty in regard to Mexican politics, can point to this week's fall as testimony to the correctness of the attitude. No doubt Mexicans will "come again," in Stock Exchange phrase; and, in point of fact, the falls of the past few days are not much, as compared with the previous big rises. Mexican Light and Power common shares are 2½ lower, Mexican Tramways 3 points down. Oddly enough, the 6 per cent. bonds of this company are a point to the good; but Mexican Light preferred at 31 have shed 4½. Brisbane Electric Tramways preference have risen 5s. to 4½.

The foreign group is dullish as a whole, with the exception of Argentines. Brazil Traction dropped to 46. On the other hand, Anglo-Argentine Tramways again rose 1/16, and the 5 per cent. debenture stock at 67½ shows a gain of the fraction; would-be buyers find that the stock is by no means easy to come at. In the British Columbia group, the 4½ per cent. debenture at 54 is easier. Victoria Falls ordinary are maintained at 19s. 6d., and the preference are steady at 23s. 9d. There is a little disappointment at what is regarded by certain quarters as the colourless character of the report. It is somewhat resentfully remarked that the directors could have produced a much more optimistic report had they chosen to do so; but those who prefer the cautious line can only commend the board for their refusal of the temptation to paint the present, as well as the future, in glowing colours.

The electric lighting market is firm, though without any further changes, save for a rise of 5s. in City of London preference, which brings the shares into line with the County preference at 10½. Illumination shares of all kinds are firm at present, and within the past few days gas stocks have been steadily mounting, following no doubt the example set by the electric lighting list two or three weeks ago. With the approach of the darker days, and reverting to winter time, it is natural enough that the lighting companies should begin to attract fresh attention.

The manufacturing group is also very firm, and once again the most active shares in the list are those of the Edison Swan Co., £3 paid. On profit-taking, the price relapsed to 21s. 6d., from which it was quickly taken up to 23s. Active dealings in the new preference are taking place at 1s. premium. The official quotation for the shares £5 paid is 1½-2, which, if we may be allowed to say so, is an absurd quotation, seeing that there is in the market ½ price, which itself is modified into something closer when buyers or sellers come to deal. The excuse for these nominal margins between prices is that, at times, a market becomes less active, and accordingly dealers cannot quote such close prices as they are able to do when there is a fair amount of business going on. But why the margin need be maintained whether the market is active or stagnant is not clear. The proper price of the £5 shares is 1½-1½, so that the official 1½-2 is not only misleading, but incorrect.

The rumours to which we have made reference on several occasions, with regard to a possible combination in the electrical manufacturing trade, have received no further confirmation, so far as we are aware. At the same time, it has been pointed out that those who are in closer touch with the industry than a financial scribe can hope to be, are probably able to obtain a better judgment on the point than he can. General Electric ordinary at 16½ are 10s. up, and British Aluminium have risen to 31s. 6d., with a noticeable amount of activity to help the price.

Underground Electric income bonds relapsed 2 to 82½, although the "A" shares at 6s. are 6d. better. Metropolitan fell ¾ to 23½, and Central London assented ordinary stock is weak at 58½. The effect of the fare revision upon the various Underground and omnibus systems has worn off; and some folks who recently bought with the idea of realising a quick profit are anxious to carry out their intention. Moreover, the railway market is dull as a whole; and with the possibility of fresh Labour trouble in Scotland, there is not much inducement to buy Home Rails at present.

Fresh rises have occurred amongst the good cable stocks; Eastern Extensions at 14½ and Eastern Telegraph ordinary stock at 148½ are both better on the week. A rise of ¼ in Anglo "A" took the price to 23. The investor continues to search this market diligently for sound stock. Marconis at 3½ are 1/16 harder and Marines eased off a shade to 2 9/32.

In the activity amongst industrials of which mention has already been made in the opening paragraph, rubber shares have again come to the front, in consequence of a rise in the price of the raw material to 2s. 10½d. per lb., while optimism looks for a further recovery in the quotation because of the

demand that is likely to be stimulated by the entry of America into the theatre of war. Armament shares are better, and there has been a good deal of inquiry during the past few days for the shares of some of the base-metal companies, particularly those which are affected by the rise in the price of silver, the white metal having reached a level higher than has been marked for many years past.

Electrical Trade in China.—In the course of an article on China's electrical industry, the *British Export Gazette* says that a good deal has been done during the last few years to encourage optimistic anticipations for trade in the future. "To take the electrical industry as an example, in China this is, of course, still in its infancy, and practically confined to large towns and open ports. Altogether there are some 87 electrical undertakings scattered throughout China, of which 62 are in China proper and 25 in Manchuria. As many as 80 of these enterprises are light or power services or the two combined; four are carried on in conjunction with electric railways, and three are devoted to the manufacture of electrical apparatus and supplies. In the aggregate, the electric energy supplied for power totals 30,000 H.P., and for light, 1,375,000 C.P. Steam is in nearly all cases the prime mover, but water is used in the Province of Yunnan. Of these 87 undertakings, no fewer than 53 are managed by Chinese private individuals or companies and six are run by the Government, while 28 are under foreign control, the Japanese being interested in 10. The total capitalisation of all these undertakings is about £2,000,000.

The value of the imports of electrical apparatus and supplies averages about £260,000 annually, and up to 1913 Germany was far and away the largest supplier, with an interest in the trade amounting to over 35 per cent. of the total, the United Kingdom coming second with about 24 per cent., and Japan third with 16 per cent. Now the position is entirely reversed, Japan taking first place with over 40 per cent., and the United Kingdom coming next with 19 per cent., Germany, of course, being entirely eliminated. In the last year or two, however, the imports *via* Hong-kong have rapidly increased, and a large proportion of these goods may safely be put to the credit of the United Kingdom. Settled conditions in China and the return of peace to Europe may be expected to expand the electrical industry altogether beyond its present proportions, the interest being taken in the market by American capitalists being specially hopeful of enormously increased demands for material and machinery. So far as Japanese manufactures are concerned, they are not altogether giving that satisfaction which was anticipated, and it is therefore quite unlikely that they will retain their present position when British electrical engineers are once more able to devote their energies to overseas markets.

THE FUSING OF AN ELECTRIC WIRE.

[COMMUNICATED.]

"It is believed that the outbreak was caused by the fusing of an electric wire."

This is a typical "explanation" given as the cause of an outbreak of fire nowadays, and it is one we can read almost every week in our newspapers.

It is quite true that, with the ever-increasing applications of electricity to the routine of life, conflagrations occasionally occur for which it is responsible, but generally in such cases the outbreak is shown to be due, not to the use of electricity, but to its misuse; but it is equally certain that the use or misuse of electricity is in many instances blamed for fires with which it has nothing whatever to do. What further proof of this statement do we need than the first three words of our opening sentence? This sentence is copied exactly from a weekly newspaper; and it is rarely that we find the accusation against supposed fused wires made more directly. There is nearly always that qualifying "It is believed," or "It is supposed." These words can only mean to an unbiased mind that there was no direct evidence that the fire was caused by the fusing of an electric wire, or, on the other hand, and perhaps more likely, that no better and more readily-adopted explanation presented itself. To the layman, electricity is shrouded in mystery; what, then, could be more fitting than that a mysterious fire should have a mysterious cause?

The writer well remembers one such mysterious fire, for he was one of the first on the spot after the alarm had been given. Acting in an official capacity, he went straight to the distribution boxes and main fuses of the electricity supply, and drew and retained every fuse. A careful examination afterwards showed that not a single fuse was of such extraordinary capacity that it would fail to give adequate protection to the installation; but although none of these had blown, or even showed signs of overheating, to this day it is the firm belief of several of those most nearly concerned that the outbreak originated with the fusing of an electric wire.

The occasion of this fire was the weekly half-holiday of the assistants employed, who, among other things, made frequent use of electric irons. Now, the fire did not break out till about four o'clock in the afternoon, the establishment having closed at one o'clock. It is, therefore, the opinion of the writer that an electric iron had inadvertently been left on, and had in time set fire to the table on which it stood, for it was well known that irons had on previous occasions been stood on the bare table without any protection whatever.

The risk of such an action, apparently, does not strike the culprit until something unlooked-for has happened. There is a prominent chief electrical engineer in whose house this same thing occurred. He once related how, in the small hours of the morning, he awoke, conscious of a very strong smell of burning in the house. He promptly hurried down stairs to ascertain the cause, and found an electric iron embedded some $\frac{1}{2}$ in. deep in his kitchen table. Someone had gone to bed and left the iron on. It was a narrow squeak.

Against such accidents as these, accidents the outcome of carelessness, for which electricity is not to blame, there is little protection, but there is ample protection for the wires in a properly installed electrical installation. That, compared with other forms of power and illumination, electricity is safe, has been from time to time amply proved by statistics.

For some time the writer has been specially interested in the question of fire protection, he having once been privileged to take an active part in a research on "the effect of fire on building materials." While thus engaged he had the opportunity of carefully examining the records of various fire brigades in the country. Where these records had been properly classified there was clear proof that the percentage of fires traced directly to the use of electricity was very small compared with its great rivals.

Yet we must not rest on our laurels. So long as there are fires which can reasonably be attributed to electricity we

feel there is something wrong. The whole question is one of efficiency—the efficiency of the electrical engineer and his workmen.

Try to call to mind some of the installations you have seen at different times, and ask yourself the question—Were they or are they safe? The writer will give one or two instances. The first is a motor circuit in a hay and straw merchant's stores. The motor drives the chaff cutter, and is on the first floor with its starter. The main switch is downstairs among the cut chaff. There is no overload or no-volt release on the starter, and it is, of course, usual to shut down from downstairs; and although it is usual to go upstairs immediately and throw the starter over to the "off" position, yet, sad to relate, it is sometimes forgotten. On various occasions, to the writer's knowledge, has this occurred, the result, of course, always being a blown fuse; but suppose, some day, that the glass of the fuse-box is broken, and the fuse, a No. 18 copper wire, blows out into the chaff; what then? A fire most probably, and caused by the fusing of an electric wire in all truth.

We next visit a draper's shop, a veritable death-trap. In the window, among the flannelette and other good burning materials, is the distribution-box. It is of the old type, and once had a wooden door with a glass front, but the hinges were weak, and the door has fallen off. Does the draper replace it? No! and he will not until the fusing of an electric wire has caused another fire, and the draper is selling off his salvage stock in his new premises.

We now arrive at a dwelling-house, to be introduced to a budding electrical engineer. This lad has run extensions from the existing installation, all over the house, but his electrical knowledge at present does not carry him beyond flexibles, and these are tacked and tied up in every conceivable manner. His indulgent parents are proud of him, and marvel at such cleverness, but if they wish to protect themselves against the fusing of an electric wire they will be well advised to double the fire insurance policy.

Our last call is a double one, for we are to visit two controlled establishments. We shall on arrival find both in the same trouble. There has been a mishap at the electricity works, and the supply has been off for a few minutes. The supply is A.C., single-phase, and the starters of the motors in the controlled works are, as usual with this type of motor, not automatically released. The supply has been off for just sufficient time to allow the motors to stop, and has then been put on again with the motors standing and the starting switches in the running position.

Two motors have been burnt out on account of the non-fusing of two electric wires; for, because of the trouble and delay caused by the blowing of fuses, these have been strengthened out of all proportion, and now when they should protect the motor they hold in, and the motor is burnt out, causing more trouble, delay, and expense than the blowing of a hundred fuses.

The writer vouches for the accuracy of all the incidents quoted above, and hopes that some lessons may be learned from them. The chief lesson is that inefficiency does not pay. We are all, at the present time, earnestly considering how best we can capture German trade; we have learned only too well how this nation in the past has consistently outpaced us in the race for commercial supremacy. We have also seen and realised the importance our enemies have attached to a scientific training. There is, however, one direction in which it has been proved that they can claim no superiority over us, and that is in practical workmanship. Yet who would think so, after reading the incidents quoted above?

We are on the eve of great changes, changes which we venture to hope will alter our whole commercial position. Cannot engineers, wiring contractors and electricians generally see that the standard of electrical work is greatly improved as well as the quantity?

The shortage of labour to-day is made an excuse for many misdeeds, yet logically, owing to this shortage of labour and consequent delays in putting troubles right, we should take no risks at all.

Cheapness must be combated to the death; it has never been good for anyone. An electrical installation should be so good that, after completion, it can be left entirely to itself, and almost forgotten.

Almost, if not quite, the most important part of an electric installation is the fuse-box. It is here that fires are prevented. The fusing of an electric wire should always happen to prevent, and never to cause, fire; and this can be brought about. It will never entirely fulfil its purpose, however, until the draper ceases to put a hairpin across to keep him going, or until the factory electrician realises that a motor that takes too much current is not working properly, and should be attended to at once.

Too many are satisfied to "carry on" so long as the lamps will light or so long as the motor will run; but this is not efficiency. The difference between efficiency and inefficiency is heat, and heat spells fire, and fire spells "the fusing of an electric wire."

For the reputation of electricity, for the welfare of our pockets, and for the benefit of the future generation, let us see that all our electrical installations are well put in and well taken care of afterwards, for it is only by this means that we shall be enabled to say to all the world: "It is *known* that a serious fire was prevented by the fusing of an electric wire."

TRADE IN NEW ZEALAND.

SOME extracts are given below from the report by H.M. Trade Commissioner in New Zealand (Mr. R. W. Dalton) for the year 1916, which has recently been issued by the Board of Trade. The report itself is published by H.M. Stationery Office (Cd. 8,686), price 6d.

The following table shows the total imports of electrical machinery and appliances into New Zealand, distinguishing those from the United Kingdom and the United States:—

	1915. £	1916. £	1915. % of total.	1916. % of total.
United Kingdom ...	245,706	325,942	71.2	68.7
United States ...	76,521	114,151	20.4	24.1
Other Countries ...	29,365	34,362	8.4	7.2
Totals ...	345,592	474,455	100.0	100.0

The war has given American firms a big advantage in this trade, but I see no reason why, if United Kingdom firms are so determined, they should not more firmly establish themselves when war is over. New Zealand is bound to become a big electrical country, and it is not unlikely that the greatest development will take place within the next few years. It is unfortunate from the point of view of United Kingdom firms that immediately before such a development American interests should have had such an opportunity to get a hold on the market. Wherever one goes in New Zealand one finds the view held that New Zealand, which is a water-power country, is almost the prerogative of American firms. I do not see for a moment why this should be so, and I believe that the comparative ability of the two countries to deal with high-tension work and long-distance transmission from water-power schemes is misunderstood. I would say that the need for very efficient representation of British firms is greater now than it has ever been in order to equalise American and British effort on the market, and to be ready for the big extensions of electrical work which will undoubtedly take place.

The greatest difficulty is to be found in securing reliable agents for machinery and engineering lines for which technical agents are required. Agents with technical knowledge are difficult to find, and those who have technical knowledge are usually so well supplied with agencies that they cannot adequately work any more. This is a very real obstacle in the way of United Kingdom firms, and it is one to which I think they will have to give their attention when the war is over. The only way out of the difficulty that I can see is that they should combine in groups to send out one technical representative from home to represent each group.

WATER-POWER SCHEMES.

One of the most important developments in the near future will be in the direction of the utilisation for light and power of the extensive water powers of the Dominion. In spite of its size and importance, the Lake Coleridge scheme, as it has been developed so far, may perhaps be regarded as only an experiment in relation to the possibilities of water-power development in New Zealand. There seems to be no doubt whatever that the Lake Coleridge scheme has been a success. The Government are eminently satisfied with the scheme and that further development of this work is to be anticipated. The Christchurch municipality, by their energy and enterprise, are also managing successfully to prove to the district that electricity will open up a new era for industries.

There has already been talk of the establishment of new industries in this district as a result of the scheme, and of developments of electrochemical and electrometallurgical enter-

prises which are made possible by the power now available, or to be made available in the future; and a contract has already been entered into with a firm proposing to produce caustic soda and hydrochloric acid. But the greater result will probably be found in the development of similar schemes in other parts of the Dominion.

During the past year the electrical engineer to the Government (Mr. E. Parry) has been engaged on the examination of a scheme to supply the whole of the North Island with electric power. The initial intention was to develop one water power for the whole island, but it was eventually decided that in view of the difficulties (chiefly of long-distance transmission) it would be desirable to have three sources. It is thought that the scheme which best satisfies all requirements is one in which, at the outset, three water-power sources would be developed for supplying respectively the Auckland District, the Hawkes Bay District, and the Wellington District. These sources would, in the ordinary course of development, be linked-up together, and by reinforcing each other provide additional guarantee of continuity of supply.

For the Auckland supply a source on the Waikato river, where 120,000 H.P. can be obtained, is thought to be best; for Wanganui and Masterton, the Mangahao river is suggested, and the power estimated for is 25,000 H.P.; for the Hawkes Bay district the best source is the Waikaremoana Lake, which is also suggested as a supplementary source for the Wellington district. It is proposed that the Wellington and Auckland schemes should proceed simultaneously; the estimated cost of these works is £1,000,000 and £1,200,000 respectively. If labour is available work may be begun at an early date on the tunnelling, road-making, &c., but it is not likely that any work involving plant will be carried out before the end of the war. As far as the Waikaremoana scheme is concerned, it is proposed that this should be deferred for the present, and be made dependent on the construction of the Napier-Gisborne railway, which the engineer favours operating electrically; without this, railway construction work would be made very difficult.

In addition to these large schemes there have been a number of smaller schemes carried out, or proposed, by local bodies and others. The Wairua Falls plant, which was installed by a new cement works in the North Auckland district in order to supply itself with power, was opened during the year, and supplies the town of Whangarei with light. It is probable, however, that most of the schemes which have not actually been carried out will be held up until a definite decision is arrived at by the Government in the matter of the larger works.

ELECTRICAL SUPPLIES.

A branch of trade which is open to improvement from the point of view of British trade is that in cooking, heating and similar appliances for household use. Domestic service in New Zealand is very difficult to obtain; it lives in a state of constant unrest, and is very intractable. The average householder is, therefore, driven to employ as many labour-saving devices as possible, and as a result the use of electrical appliances is more a necessity than a luxury, even in quite small households. British articles of this class are seldom seen, and it is generally stated that they do not compare, either in efficiency or finish, with similar appliances from other sources. For all these articles there is an ever-increasing demand.

There has been an enormous trade done in New Zealand in electric torches and batteries. Japan has delivered a great number, but these have been found very unsatisfactory. The torches and batteries with the greatest sale are now American, and for similar articles they are very much cheaper than British; the range is a very big one so far as cases are concerned. In regard to the batteries, the main attraction is a guarantee of service with every battery, the date to which the battery is guaranteed being marked on each article. There is an undoubted opportunity for the trade in British articles of this class. There are one or two well-known makes already on the market, but buyers complain of the price.

Japan has done a fair trade in electrical supplies, but it has been found that these are unsatisfactory, and I am told that unless considerable alteration is made the trade will not last.

THE EFFORT NEEDED.

It is fairly safe to assume that for reasons both of improvements in producing methods at home and of the quickened patriotic sentiment in the Dominion, British manufacturers will be in a more favourable position for competing when the war is over. The advance of foreign trade at the expense of British trade is not serious in the total, but it should be remembered that it is fairly serious in some individual lines. Preparation may be made, and should be made now, to deal with the position when the war is over; the actual effort in most trades may have to be deferred, but in the meantime British firms should explain to customers the difficulties of delivery.

Many complaints have been made to me as to the treatment customers have received from firms at home since the war, but I find that when buyers here understand the difficulties under which all business in the United Kingdom is being carried on, imagined grievances largely disappear; most people understand in general the straits to which firms at

home have been put, but they do not understand in detail that expert packers have gone; that office and shipping staffs are almost entirely new to their work; that in many cases actual producers are new, and have to be trained, and so forth. It is on these points that firms should give more information.

As regards machinery, in cases where the position of British firms is unsatisfactory the reason is to be found chiefly in one or more of the following facts:—(1) That our manufacturers have not examined the development of the Dominion; (2) that if they knew of the development, they either have not realised its importance or have not attempted to cater for it, but have persisted in offering unsuitable lines; and (3) that their selling campaigns are not adequate. I can quite understand that firms may not find it profitable to manufacture certain lines exclusively for this market, if those lines are different from their standard designs. If this is so, however, it would be better for themselves and for the reputation of British trade in general to refrain from offering on this market lines which are unsuitable, or from offering suitable goods in such a manner as would seem to indicate that it was immaterial to them whether they got the trade or not. As it is, our manufacturers are continually being compared with American manufacturers to their disadvantage. The fact is, of course, that the American manufacturers supply to this market machinery which is such as they have to manufacture for their own home conditions, and it is, therefore, not particularly enterprising of them thus to supply New Zealand's needs.

As I said last year, American production is so much standardised that in the majority of cases, perhaps, manufacturers in that country would be even less disposed than British firms to alter their patterns—the trouble is that they are not so frequently asked to do so because, for the reasons already indicated, there is not the same need.

SCIENTIFIC AND INDUSTRIAL RESEARCH.

(Abstract of Report of the ADVISORY COUNCIL OF THE DEPARTMENT OF SCIENTIFIC AND INDUSTRIAL RESEARCH.)

(Concluded from page 227).

It will be an important part of our duties to arrange for surveys to be made of existing scientific knowledge and the fields for research in particular industries. Systematic surveys of this kind are needed in many directions, and we are arranging for their production as rapidly as circumstances will permit.

On the advice of the non-ferrous section of our Standing Committee on Metallurgy we have appointed a committee to prepare for us two surveys giving the existing knowledge and practice as to the zinc industry, and as to the smelting and refining of copper, and the qualities of copper and the copper alloys. We are entrusting to this Committee as an interim arrangement, pending the establishment of an Association for Research into the non-ferrous alloys, the direction of a research into the best method of making sound castings of copper and brass. The Brass and Copper Tube Association have offered a contribution of £1,000 towards the cost of this investigation, and we have recommended the Council to make an equal contribution.

We have asked a Special Committee of the Standing Committee on Engineering to prepare a memorandum on the field for research into lubricants and lubrication, with an analysis of the problems involved, and a suggested scheme of research. We have also offered a grant to the Bradford Association for Engineering Research towards the cost of preparing a survey of the field for research into the flow of steam in pipes.

As the result of representations made to us by the Society of Illuminating Engineers we have appointed a joint Sub-Committee of our Standing Committee on Engineering and Glass and Optical Instruments, together with certain co-opted members from the Society of Illuminating Engineers, to make a survey of the field for research in illuminating engineering.

The Government of the Commonwealth of Australia have appointed an Advisory Council of Science and Industry with an Executive Committee, of which the Prime Minister is the chairman. The Executive Committee have entered into direct relations with our Council.

In June of this year the Secretary of State for the Colonies forwarded to the Department a copy of a dispatch from the Governor-General of the Union announcing that "arrangements" had "been completed for the organisation and carrying out of a system of investigation into the national resources of South Africa with a view to assisting and developing industrial activity within the Union." We have opened semi-official correspondence with the South African Scientific and Technical Advisory Committee, and have offered to furnish them with all information and assistance in our power.

Progress.—The investigation into the corrosion of non-ferrous metals in sea-water initiated by the Institute of Metals has already yielded positive results which may prove of great practical value. With the assistance of the Brighton Corporation full-scale experiments running night and day were arranged under the general supervision of Captain Bengough, who was in charge of the research. The pro-

gress now made is not the result of the large scale tests—valuable as these are likely to prove—but the result of systematic laboratory attack. The research has now been extended, on the initiative and with the assistance of the British Electrical and Allied Manufacturers' Association, to cover corrosion of condenser tubes in service on land.

The Institution of Gas Engineers have long supported a research under Dr. Mellor into refractories at Stoke. The Council recognise that the problems connected with refractory materials call for greatly increased attention. Any scheme to be satisfactory must find a proper place not only for the work which has so long been carried on at Stoke, but also for that more recently begun with valuable results at the National Physical Laboratory, as well as for that in contemplation at Sheffield and elsewhere.

Another important research being conducted at the Stoke School under Dr. Mellor and Mr. Bernard Moore is making very satisfactory progress; it is an attempt to produce a marketable hard porcelain from purely British material. A ware has already been produced which is expected to prove cheaper than English earthenware. A cheap and new glaze has also been developed.

The flow of steam through nozzles is a matter of deep importance to steam turbine manufacturers, and the Council recommended a grant for a series of preliminary investigations in which the University of Manchester, the Royal Technical College, Glasgow, the British Westinghouse Co., and the British Thomson-Houston Co. are taking part.

A research at the National Physical Laboratory into the heating of buried cables, planned by the Institution of Electrical Engineers more than four years ago, had been held up through lack of funds until the Committee of Council made a considerable grant on our advice. The work was put in hand early in 1916, and the experimental cables are now all laid and connected except one. The installation of apparatus in the huts is complete, and regular observations are in progress. The cables, which are all paper-insulated, include armoured cables laid direct in the ground, cables laid solid in bitumen, and cables drawn into a six-way stone-ware duct. The County of London Electricity Supply Co. undertook the drawing-in and jointing of the larger cable. Lengths of concentric cable have been lent by the same company, and five lengths of three-conductor cable have been lent by the Newcastle-on-Tyne Electric Supply Co.

The electricity supply undertakings of Bristol, St. Marylebone, and Wolverhampton have co-operated by placing sections of their cable systems at the disposal of the staff of the National Physical Laboratory for observations and measurements extending over considerable periods of time.

Concurrently with this work, and with the aid of the Department, extensive research has also been carried out for the Institution of Electrical Engineers at the University of Liverpool under the direction of Prof. E. W. Marchant and Mr. F. J. Teago. A careful study has been made of the heating of feeder cables of various sections laid in stone-ware troughs filled with bitumen at a depth of about 3 ft. below ground. The mains were laid by the staff of the Liverpool Corporation electricity works. Valuable results have been obtained showing the relation between final temperature rise and current density. In addition, the values of the thermal resistances of the cable coverings and the trough are being determined.

Another research, initiated by the Institution of Electrical Engineers, into the properties of insulating oils and aided by the Department, has been carried out with the assistance of a number of important engineering laboratories and firms, who have placed the services of their technical staffs and their works, together with a considerable quantity of oil, at the disposal of the research. The research had already been in progress three years before it was aided by the Department. Reports received show that considerable progress has been made.

On the advice of our Standing Committee on Engineering, we have initiated a series of preliminary experiments in steam plant for high temperatures and pressures, which is being carried out with the assistance of Messrs. Babcock & Wilcox, Ltd., at the Royal Technical College, Glasgow. We have arranged that the investigation shall begin with careful observations of the internal and external deterioration of superheaters operating at high temperatures. The investigation is being conducted under the direction of a Special Sub-Committee of the Standing Committee on Engineering, with Sir Maurice Fitzmaurice as chairman.

We have refused during the past year to recommend grants in 25 cases.

When we reported last year we had recommended maintenance grants to nearly 40 individuals under a provisional scheme, but a number of these were unable to begin work, mostly because they were called to the Colours. The actual awards made during the session 1916-17 amounted to 36, of which 24 were to students being trained in the methods of research (of whom six were women), 10 were made to independent research workers, and two were made for research assistants.

The Committee of Council have placed a sum not exceeding £6,000 at our disposal for grants to research workers to be made during the session 1917-18, and we intend to continue our experiment of last year. We propose to consider applications for personal allowances, and for assistants,

apparatus, materials, and equipment from research workers in general, and not to confine the grants, as we did at first, to workers in educational institutions.

We have given considerable thought during this year to the question of encouraging inventors. The Department cannot assist in the commercial exploitation of patented inventions. In any suitable cases, however, where funds were needed for working out on a full scale a process or device already patented, we think that we might properly recommend a grant for this purpose, since it would clearly fall within the meaning of industrial research. Inventors who submit suggestions or ideas for investigation are advised if they wish to retain proprietary rights in their invention to obtain provisional protection before submitting details of their invention to the Department.

The encouragement of the discoverer and inventor is a matter with which we have great sympathy. The Department propose to make it a condition of their recognising trade associations for research that provision should be made in the articles of association for the results of any researches being communicated in the first instance to the Committee of Council in order that, after consultation with the board of the association, and any other co-operating bodies and persons, the Committee may determine in the national interest whether, and to what extent and under what conditions, the results shall be made available. This clause will enable the Department to secure, among other things, the interests of the inventor or discoverer who has done work for such an association.

We have received a number of applications from individual firms asking for assistance in dealing with difficulties encountered in the course of manufacture. The co-operative associations for research which we hope to see established will no doubt prove very useful to their constituent firms who are in difficulties of this kind; in the meantime, we shall do our best to assist inquirers to obtain the best advice available. In cases where the difficulty put before us appears to raise a problem of research, we shall, in suitable cases, provide the necessary funds. When a result is obtained we shall invite the manufacturer to repay the cost, or part of the cost, of the investigation, in return for an exclusive right to the use of the results for a period to be agreed on.

We have been considering other possible means of encouraging individual manufacturers who have shown in an unmistakable way that they are anxious to place their works on a scientific basis. In cases such as these we should be prepared to entertain a proposal to attach a young research worker to the works laboratory for an agreed length of time, which might be divided into three periods. During the first period the Department would pay the salary of the worker, during the second the Department would pay half, and during the third the firm would pay the whole.

Whatever has been accomplished will be better understood by comparing the general attitude of manufacturers to-day with their attitude before the war, or even 18 months ago; by noticing the rapidity with which men of science at long last are coming to their own; by listening to the altered tone of all classes, and not least the men of business, towards the claims of education.

A Gas Engine Record.—The experiences of gasolene engines are not usually entertaining, but an exception to the general rule is provided by the career of an engine which was formerly part of the equipment of the No. 1 Australian General Hospital at Lemnos Island. Dr. Stanley Argyle, in the course of a lecture, recited its history. He had to take it over from Egypt to Mudros, where its main function was to supply electric power for the X-ray apparatus at the hospital. Incidentally, it furnished electric illumination for all the tents, and was generally a great boon to the patients. Later it was taken over to Gallipoli, where it survived to the end, and supplied light in numerous dug-outs. At the famous evacuation it was not abandoned, but, together with the electrical equipment connected with it, was removed from the peninsula, "not a yard of wire," added Dr. Argyle, amid applause, "being left behind." *Melbourne Age.*

Research in Japan.—According to a paragraph in *L'Economista d'Italia*, the Japanese have decided on the establishment at Tokio of a laboratory for scientific and industrial research. The chief work of the institution will be to develop Japanese industry by the application of modern methods. The main sections of the laboratory will be those devoted to researches in electricity, chemistry, electrochemistry, textiles, and metallurgy. To cover the expenses, Parliament has passed a law empowering the Government to make a grant to the laboratory of two million yen (over £200,000), payable in instalments of 200,000 yen per annum over a period of 10 years. The Imperial Household has also made a grant of one million yen (£100,000). At a recent meeting, the promoters of the scheme elected a Committee, whose object will be the collection of funds independently of Government grants. A sum of 2,900,000 yen (over £290,000) has already been collected, so that the laboratory will have available funds exceeding five million yen (half a million sterling).

PARIS TRAMWAYS AND WAR TROUBLES.

A TYPICAL instance of the difficulties with which French tramway companies have to contend under the conditions of the war is afforded by the experience of the East Parisian Tramways Co. (Tramways de l'Est Parisien), whose gross profits in 1916 were less than in the preceding year, and which succeeded in equalising the expenditure in 1916 only as a result of the gross profits which were realised on the manufacture of munitions of war. These matters are fully set forth in the company's annual report, and amplifications were given by the chairman at the recent general meeting, particular interest being manifested in figures showing the great advance in the cost of materials as compared with the period before the war.

The report states that, while the normal working conditions upon which the fares fixed by the company's concession were based have been completely changed by events which could not be foreseen, and while the sale prices in trade and industry everywhere have increased at a rate corresponding to the advance in cost prices, the company are prohibited from making any modification in the fares to be paid by passengers. The steps taken by the directors with the object of securing a change on the part of the local authority which granted the concession have had no effect, and the intervention of the Government has only been manifested in the direction of increasing the company's burdens by enforcing the grant of war bonuses to the tramway workers, whereas such bonuses, it is contended, should have been simultaneous with the giving of permission to raise the fares. In addition, the conceding authority, persistently ignoring the state of war, has applied the penal clauses of the concession contract by inflicting daily fines upon the company for the non-observation of the time tables in operation in peace times, whereas the present conditions render it impossible to adhere to these time tables absolutely. Not only so, but despite numerous applications, the company have not yet been authorised to bring into operation certain advantageous arrangements in the concession contract which only require the fulfilment of certain formalities which were already concluded some time ago.

The difficulties which were referred to in the report for 1915 have been accentuated with the continuation of the war. Although the company were eventually empowered to extend the use of female labour in the working of the cars, it is not possible to maintain the effectives without trouble, and the maintenance staff in particular has not been adequately reconstituted. The scarcity of specialised labour, and the impossibility of obtaining all necessary raw materials and spare parts for the maintenance of the rolling stock and tracks, have compelled the company to limit their efforts to the execution of the most urgent works, the others being postponed for the future. The same circumstances have prevented the execution of renewals to the extent followed in normal times, but the delay will be overtaken as soon as the means are available. It has, however, been possible to double four lines in connection with the scheme for the reorganisation of the system.

M. Bonsquet, chairman of the company, directed the attention of the shareholders at the meeting held in 1916 to the exceptional charges which the company had to bear, and which arose from (1) the enhanced cost of raw materials, (2) the increased cost of coal, and (3) the rise in wages.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

THE "ELECTRICAL REVIEW'S"

ELECTRICAL & ALLIED TRADES DIRECTORY (THE RED BOOK),

1917 EDITION

NOW READY.

H. ALABASTER, GATEHOUSE & KEMPE,
4, Ludgate Hill, London, E.C. 4.

Amplifying this information at the recent meeting, the chairman quoted the following figures in regard to the prices which prevailed before the war and those which were charged in June, 1917 :—

THE COST PRICES OF MATERIALS IN FRANCE.

	Pre-war period in		June, 1917.
	1914.	1914.	
Cast-iron	33'00	110'00	
Cast-steel	90'00	240'00	
Brake blocks	18'00	75'00	
Trolley poles	21'00	63'50	
Wheel tires	36'00	115'00	
Tool steel	8'00	35'00	
Copper wire	230'00	670'00	
Oak wood	1'50	5'40	
Motor oil	45'00	210'00	
Coal	29'00	182'00	

The chairman did not mention the weights, &c., to which the figures apply, excepting in the case of coal, but the differences are sufficient for the purpose of illustrating the great advance. The cost of the imported coal relates to the tonnage price delivered at the company's power station, the coal having to be conveyed from the ports up the Seine as far as Vitry. In this connection it is stated that the coal now being received is far from equalling that which was supplied prior to the war. The mines, the chairman explained, are no longer worked with the same care as in times of peace, and the coal forwarded is not well sorted or well washed, so that it does not yield the same efficiency. For instance, the consumption of coal at the company's power station, which amounted in peace times to 1,300 grammes per kw.-hour produced, has now risen to 1,450 grammes per kw.-hour, so that a larger quantity of coal has to be consumed in order to obtain the same quantity of energy. The chairman also referred to the labour question, and mentioned that a further war bonus of 0.75 fr. per worker per day has been compulsorily imposed upon the company by the Government, making a total advance of 1.50 fr. per individual since September, 1916.

The effect of the increases under the foregoing three classes has been to double the working expenses per car-kilometre run, as contrasted with the pre-war period. This fact is illustrated by the following figures concerning the working expenses in the first four months of the five years mentioned :—

WORKING EXPENSES PER CAR-KILOMETRE.

First four months of 1913	0.539 fr.
" " " " 1914	0.564 "
" " " " 1915	0.767 "
" " " " 1916	0.776 "
" " " " 1917	1.069 "

The chairman, in conclusion, again referred to the question of fares, and remarked that it was impossible for the State to recognise the necessity for an increase in railway fares, which had been sanctioned, and to refuse to give the company any compensation in the same direction. During the discussion attention was drawn to the fact that certain tramways, notably the tramway from Paris to Bourg-la-Reine, had raised their fares by 25 per cent. It was explained, however, that the particular undertaking concerned was not a tramway, but a "railway of local interest" (light railway)—the Compagnie de Chemin de Fer sur routes de Paris à Arpajon—which is not subject to the same *régime* as the tramway companies in the Department of the Seine.

Electricity Supply Restrictions and Prices in Germany.

As a result of the comparative scarcity of coal in Germany, owing to the great demand and the shortage of mining labour, the Government recently issued an order placing restrictions on the consumption of gas in general, and this is about

to be followed by a similar order in relation to the use of electricity. The object in each instance is to effect economy in the consumption of coal, and new connections to the distributing mains will only be permitted in cases which are officially considered to be very urgent.

A war-tax on the sales of coal as from the pits was brought into force on August 1st, and producers are authorised by law to add to the accounts rendered to customers the amount of the increase arising from the imposition of the tax. In their turn, the electricity supply companies and local authorities who own supply works are also empowered, as from August 1st, to transfer to consumers the additional burden resulting from the greater cost of coal. The German War Office authorities, through the Imperial Commissioner for Gas and Electricity, have now issued a communication pointing out that since the beginning of the war the prices of coal have risen by 100 per cent., and even higher, and those of other raw materials by several hundreds per cent., whilst, at the same time, wages have advanced to an extraordinary extent. In addition, the gas and electricity supply works have also assumed considerable burdens in the direction of contributing towards the support of the families of those workmen who have been called up for army service. As a consequence, the calculations upon which supply contracts entered into before the war were based, have been completely upset. It is therefore contended that large consumers, although in individual cases having the formal right on their side, reasonably can no longer ask to be supplied at prices which result in a loss, when they themselves realise ample profits from the sale of manufactures at prices corresponding with the general advance in the costs of production. It must consequently be expected, it is said, that large consumers, just as the Government departments have done on the production of proofs of the disproportion between prices, will consent to pay to the gas and electricity works an increase in price equivalent to the expansion in the latter's cost of production.

The official communication proceeds to state that the influences of war conditions on the tariff rates arranged in the contracts for the supply of small consumers are still more surprising, as in these cases other matters come into consideration besides the growth in working expenses. For instance, the expenses of making connections for consumers are paid on the assumption of lasting and unhindered utilisation, and the tariffs were fixed on the assumption of a minimum period of consumption in the case of the installations connected up. But these contract conditions have partly experienced a decisive change and partly been abolished by the introduction of "summer-time," the restrictions imposed by local authorities on the consumption of light and power, and the stoppage of establishments or of machinery, as, for instance, bruising mills in agricultural districts. Moreover, numerous small consumers have been requisitioned for the army, and either do not meet the obligations they assumed on the connections being made, or only do so incompletely.

A large number of towns and communes for the foregoing reasons have voluntarily consented to pay an increase in the tariff rates charged to them, the advance frequently being regarded as appropriate at 25 per cent. It is held to be in the interest of the local authorities for the gas and electricity works to be maintained in an efficient condition, and in their decisions the latter cannot leave out of consideration the fact that working during war time is associated not only with a very unusual growth in the working expenses, but also with an extraordinary depreciation of the plant, and that materially higher prices will have to be paid for renewals after the war. The War Office authorities, under the circumstances, conclude by stating that they consider it requisite and just for consumers to pay to the works prices which correspond with their increased costs of production, in the interest of the works being maintained in regular operation.

SOME SUGGESTIONS FOR THE PREVENTION OF MISTAKES IN METER READING.

By G. W. STUBBINGS.

THE periodical reading of consumers' meters was, before the war, a business that was carried out smoothly and with little trouble. Meter readers were thoroughly accustomed to their work, and mistakes were of comparatively infrequent occurrence. In present circumstances, when men and women of little or no previous experience have to be put on this class of work, mistakes are considerably more frequent. The operation of meter reading is peculiar, in that the person engaged on the task works quite by himself, and cannot be supervised in the same way that other employes are. Mistakes, moreover, may be of far-reaching consequence, causing friction with consumers and involving great trouble for their satisfactory adjustment. It is therefore desirable to inquire into the various possible mistakes that can be made, the probable causes of the same, and also to consider the question as to what system of instruction will best fit the new meter reader to perform his or her work speedily and accurately.

The most serious error likely to be made is that of misreading the meter, as this is the most unlikely to be immediately discovered. The operation of meter reading, although seeming so simple to those thoroughly accustomed to it, gives great trouble to beginners. The difficulties are greatly increased by meters being fixed in bad positions for reading. It is always worth the expense of a few feet of cable and tubing to arrange for the meter to be in a position convenient for reading, as the possibility of error will be greatly reduced. A meter is not like a service cut-out, which has only to be examined in unusual circumstances, but is fixed in a building expressly in order that it may be read periodically. Meter dials should be as large as possible, and have bold plain figures; and these dials should be in a line, in the correct sequence. Some meters have three dials arranged in equilateral triangular fashion, and it requires a close inspection of the meter to discover the correct order for reading. With cyclometer or jump counters, the possibility of error should be largely reduced, but difficulties are often introduced by the necessity of having the eye of the observer level with the counter for reading. Furthermore, counters having figures engraved on white metal barrels are difficult to read in a bad light. A good dial counter can be read while at a level of 2 or 3 ft. above the eye, in a moderate light. It is of great importance in a cyclometer counter to have the decimal figures plainly marked. A red comma is not sufficient, and means should be employed to make the distinction quite obvious. Meter readers should always be instructed to read meters of large capacity with extra care, and thoroughly to examine the dial before so doing. With such meters the last dial to the right sometimes reads 10 per division. If it is the custom to set dial counters to zero in the test room, this should be carefully done, otherwise inconsistent readings of adjacent dials may cause the meter reader to blunder.

Conscientious meter readers can usually discover serious errors of reading by comparing the consumption indicated for the current quarter with that for a previous corresponding period, making intelligent allowances for altered circumstances. If meter readers could only be trained to take this simple precaution before leaving consumers' premises, and also to check their reading if the consumption appeared at all different from what should be expected, serious errors would be largely avoided. To encourage this to be done, it is not advisable to insist unduly on speed in meter reading. Accuracy is the first essential; speed, whilst being desirable, and characterising an efficient meter reader, is only secondary.

Some meter readers are very prone to errors in subtraction. This mistake is, of course, immediately detected by the clerical staff dealing with the readings, but it involves a journey to the consumer's premises to correct his meter-card, and not infrequently elicits from the consumer a facetious letter informing the department of what they have already found out. This error can be avoided if the meter

reader will perform the subtraction twice—once in the meter reading book and once on the consumer's card—and then compare the results of his two calculations. This simple precaution is very difficult to get carried out, as usually the meter reader copies from the book to the card, or *vice versa*.

Errors sometimes occur on premises having more than one meter, by confusion of the meters, and entering up the reading of one on the page in the book allotted to the other. This is usually due to gross carelessness; but, nevertheless, the system of marking the owners' numbers on meters should be a good one, and it should not be necessary for the meter reader to scratch a rusty label in order to discover such number. The system of stencilling owners' numbers on the glass, or marking it on the dial, has much to recommend it from the point of view of meter reading. This method should, however, only supplement, and not displace, the more permanent brass label.

It is an excellent practice for meter readers to try all meters on one light, or on the smallest load possible. This is not always convenient, but if the consumption shown by the meter differs considerably from that of the corresponding period of the previous year, a special effort should be made to do this. It is to be remembered that a meter does not usually stop suddenly, but gradually gets slower on low loads, with a gradually increasing starting current. A meter may show a satisfactory consumption, and, indeed, be accurate on the usual load of the installation, while stopping on one light. Next quarter such a meter may fail altogether, necessitating an estimated consumption and the possibility of dispute. Systematic inspection of meters whilst reading, and changing those unsatisfactory on one light, will greatly reduce meter stoppages. It is a good plan to have a small column provided in the meter reading book, in which a tick can be made if the meter has been tried. A different mark should be made when the meter was found going, as in the case of a power load. When readings are being examined by the consumer's clerk, those showing an unsatisfactory consumption, the meter not having been tried, can be held back in order that this may be done.

Meter readers should be instructed to endeavour not to talk to consumers, and not to express any opinion regarding any complaint they may have to make. Such a discussion is not only a waste of time, but sometimes gives rise to disputes, owing to the consumer alleging that the meter reader said something that he either actually did not say, or did not intend to say. Meter readers may be betrayed into expressing some opinion which will subsequently be quoted by the consumer as having been offered by an authorised representative of the supply authority. Meter readers should, therefore, tell consumers to make their complaints by letter. The same applies to requests by the consumer for work to be done, or minor alterations to be carried out. In cases of low consumption the meter reader might inquire of the consumer as to the reason of the same, and make a note of such reason. This will be useful, as at some future time an estimated consumption may have to be made, when the consumer may endeavour to get the low consumption, which really was due to abnormal conditions, taken as a criterion for estimation. The instruction to avoid, as far as possible, conversation with consumers must not, of course, be taken to absolve meter readers from the natural obligation to be courteous, and to endeavour to cause the consumer as little inconvenience as possible.

Seals should be examined on meters, and, as far as practicable, on service cut-outs also. It is, however, advisable for service cut-outs to be separately inspected and examined periodically. These cut-outs are often fixed in out-of-the-way positions, and to insist on an inspection of the seals by the meter reader would unduly delay the readings; while, quite possibly, some cut-outs would never be inspected. A separate inspection—say yearly—of service cut-outs is therefore desirable.

It is a good plan for the electricity department to have drafted a set of instructions representing the practice of the department regarding meter readings. Such instructions should be typewritten, and a copy should be given to each meter reader for thorough perusal. A suggested set of instructions is as follows:—

INSTRUCTIONS TO METER READERS.

1. Read meter twice, once for meter book and once for consumer's card. Subtract twice to obtain consumption, and, finally, compare entries in card and book. Do not copy from card to book, or *vice versa*.

2. If consumer's card be full, make out a fresh one. If the consumer has difficulty in finding the card, request that it be kept near the meter.

3. Endeavour to try all lighting meters on one light, and power meters on the smallest load possible. If the meter is satisfactory, make a tick in the column provided. If the meter will not work on one light, ascertain the smallest number of lights on which it goes, and note this in your memorandum book.

4. If the meter be found stopped, make a note of this, and also of the reading, but make no entry either in the meter reading book or on the consumer's card.

5. Compare the consumption with that for the corresponding quarter last year. If markedly different, check the reading, and, if low, try the meter, if this has not been done. If all is satisfactory, inquire of consumer the reason of the abnormal consumption, and make a note of the same.

6. Complaints of high consumption, or verbal orders for work to be done, are not to be taken by meter readers. Inform the consumer that such complaints and orders must be made in writing.

7. While always being civil to consumers, endeavour to have as little conversation with them as possible. Above all, refrain from expressing any opinion regarding any complaint they may have to make.

8. Inspect seals on meters, and also, if possible, on cut-outs, noting any missing. Make a note also of any broken meter or cut-out glass, or any apparently defective wiring you may come across.

THE QUESTION OF "THE STAFF" IN ENGINEERING ESTABLISHMENTS AFTER THE WAR.

[COMMUNICATED.]

At the present time discussions anent the extreme importance of harmony existing between workman and employer are as plentiful as leaves in autumn.

It is laid down as an axiom, and quite rightly, that the workman must turn out more work, and be permitted to earn higher wages, than tradition has approved of in former days; and that the manufacturer must have his works full of good orders, which will be obtained solely and simply by the fact that he can turn out articles by the 100,000, with the aid of automatic machines worked to their full output, enabling him to place his wares on the market at an extremely low price.

At the same time, we hear on every hand of the necessity of better and wider education for engineers; of the necessity of technical preparation for even the coming generation of workmen; and of insistence on study for two or three years at an institution of university standing for those who would take commissioned rank in the new engineering army.

Whilst in its way all this discussion may be quite good and necessary, it seems to the writer that the interests of one important section of the engineering army have been overlooked entirely. This section is that generally known as "The Staff"—usually spelt with a large S when referred to at annual dinners on the occasion of the annual back-patting exhibition, and with a very diminutive s when its salary is being considered.

To say that in the past, and even to-day, the staff—in which term are included all technically-trained men, whether in the drawing office, the test-bed department, or on administrative work—have been underpaid and shabbily treated, is to state a platitude. Yet, without this body of men, the engineering industry would be impossible in this or any other country.

Let us consider for a few moments what the training

and work of men engaged in such appointments include, and then consider their remuneration. A young fellow after spending, say, four to six years at a good grammar school, has usually entered some works as an apprentice, with an agreement to go through all departments, and to finish up in the drawing office; certainly, during the last 20 years, it has not been the invariable custom to pay a premium for this privilege, but a low rate of wages, and in many cases no wages at all, have been the rule.

Diligent work during the day has been supplemented by study in the evenings, the man's general education probably having taken him at least up to quadratics and through a considerable portion of Euclid, and given him also a good foundation in physics and chemistry. At the evening technical school this man has been enabled to enhance his theoretical knowledge to a considerable extent; opinions of people interested in purely day courses notwithstanding.

Thus, at the end of five or six years, by the time the man has attained the age of 22 or 23 years, he has a good practical acquaintance with actual commercial work, and a very sound theoretical education, especially in applied subjects. And let it be remembered that this training has cost him no small amount of study and thought, of a particularly tiring and concentrated type.

The same course of training has often been followed by the boy coming from a rather lower social stratum, who has worked his way from the elementary Council school up to a higher grade school, and there obtained a good sound drilling in mathematics and practical science.

Both these men will be engaged as draughtsmen for some time after they have become 21 years of age, and will be quite ready to work in subordinate appointments as long as they can gain wider and more valuable experience.

They expect, and the writer upholds them in this view, that by the time they are 25 or 26 years of age they should be able to earn, in ordinary peace time, at least £120 to £130 a year. It is well known, however, that in ordinary times this salary is not paid to a man unless he is doing responsible—in fact, very responsible—work, involving fairly difficult calculations, and at least a good working knowledge of the plant he is assisting to design, whilst he is usually nearer 30 than 25 when he reaches this meagre salary.

A step on the ladder of promotion, often looked forward to with some amount of eagerness, arrives when the draughtsman is asked, at about the age of 28 years, to go down to the works of some customer of the firm, and witness a test on some of the firm's plant.

This is responsible work; and the writer has known men almost live on the job for ten days or a fortnight on end in order to achieve guaranteed results and to give satisfaction to a customer.

Work of this type demands that a good and really smart suit of clothes be worn whilst the firm's client is being visited, and it is worthy of remark that the draughtsman provides this suit out of his own pocket; and if he is not willing so to rig himself out, he will certainly not be sent on such work.

That a smart appearance is necessary on such work is undeniable, but to expect a man on £130 a year to keep such an appearance going is in every way unfair, especially as this type of work soon ruins his clothes.

All that such men get out of such appointments is a few days at a more or less good class hotel, and, as a rule, anything from a week's to a fortnight's harassing work, which extends from first thing in the morning to late in the evening.

Naturally, having been on such work confers some amount of distinction on a man, and on first getting such work to do he is elated at his prospects. Time, however, soon shows him that he is not the only man to possess such experience, and that his value in the open market is but little enhanced on that account.

It is at this stage that dissatisfaction sets in, and it is fortunate for the man himself, the profession to which he belongs, and the country in general, that he so seldom turns out of the straight path, but contents himself with grousing and preventing his own or his friends' children from following in his footsteps.

On the other hand, there are some reckless and daring spirits who will not sit down under what they consider a grave injustice, and so decide to make society in general give them an income more in keeping with their talents than ordinary straight going will provide.

To the writer it seems obvious that the scandalous under-payment of staff engineers is nearly always at the bottom of these regrettable wrong-doings.

No decently educated fellow is going to risk his future career, and, above all, his honour and reputation, unless he has been brought to such a state of bitterness at his prospects in life, compared with the standing he should occupy and the salary he should receive, when the national importance of his work is considered, that he loses all caution, becomes reckless, and decides that the community which confers thousands a year, or even a month, on tricky company promoters, shall be laid under toll to his brains and abilities, for something better than a mere pittance.

The writer asks for no sympathy for such men, they must be put out of the reach of doing such mischief; but he does ask the great industry to which they belong to reflect that when such ability goes so far wrong, there must also be something radically at fault with the management of the industry itself.

Above all, it must be admitted that, to a man educated as outlined above, £200 a year at 30 years of age, with the off-chance of £350 by the time the age of 38 or 40 is reached, is only a meagre prospect.

What, then, must the prospect appear to those whose parents have, in addition to the training outlined, spent the necessary money to give their sons a theoretical education of University standard, such as is being called for to-day?

The prospect is practically ridiculous; and when it becomes realised, it will prevent men coming into engineering, with the consequence that either the British engineering industry will not be equipped with the type of official staff required for the very strenuous conditions immediately before us, or it will be necessary to call in the well equipped foreigner, who works for a pittance in return for learning our language, our ways, and the general lay-out of our works, the towns in which they are situated, and the roads and railways which lead to them; for it is in this way that the low-priced foreign staff engineer has taken his full payment.

To conclude, the writer draws from his own experience. Educated for some years at a well-known grammar school, he, along with others, went into engineering in the manner previously outlined, and was also a day student after reaching the age of 21.

Having always kept in touch with the "Old Boys" Association, it is pleasurable and profitable, once or twice a year in normal times, to foregather and talk matters over with the fellows who were for years in the same Form, and who went up the school in work and play alongside oneself.

Practically in every case the men who have gone into commercial pursuits, such as banking, have not only done better, from a salary point of view, than the engineers, but have had much less study to obtain their positions; whilst they are free from quite half the worry which a similarly paid engineer has to put up with, and rarely, if ever, have to face the personal discomforts and risks which are a portion of the staff engineer's daily routine. Consequently, one meets one engineer after another who does all he can to discourage suitable boys from taking up the profession, and who, as a rule, absolutely forbids his own progeny to take it up.

The workman has to be considered, because he is ready to fight. Do the heads of our great engineering firms wish to make the staff man think that he, too, will never receive fair remuneration, or fairly reasonable security of tenure, unless he also prepares to defend his interests in the same manner?

Stinginess in granting war bonuses to meet the higher cost of living, and the general absence of any idea of remembering the wants of the staff, in making after-war arrangements, go a long way to confirm this idea.

Let us hope that, before it is too late, this oversight will be remedied.

THE PLIOTRON OSCILLATOR.

In our issue of May 28th, 1915, we described the pliotron, and its varied uses in wireless telegraphy and telephony; as there explained, its operation depends upon the passage of current between electrodes in a high vacuum by means of pure electron discharge—the thermionic current. The pliotron has not yet made its appearance on the market in this country, but its construction and applications are being developed in the United States by the research laboratory of the General Electric Co., of Schenectady, and in the *General Electric Review* for August Mr. W. C. White describes its use for obtaining either a large current or a high voltage at high frequency.

When used as an oscillator for the production of alternating current from a direct-current source of energy, the pliotron has the characteristics of an amplifying relay; that is, the wave shape of any variable E.M.F. applied between the electron-emitting cathode and the grid (or controlling member) will be faithfully reproduced by the current in the main anode-to-cathode circuit. Hence the input of a small amount of A.C. energy will set up a relatively larger amount, identical in frequency and wave shape; and by utilising a small proportion of the A.C. energy thus produced to feed back to the input circuit, the system can be made self-exciting; A.C. energy can thus be obtained from a D.C. source, the pliotron and its auxiliary apparatus forming a type of converter.

For laboratory and testing purposes, there is considerable use for constant-amplitude high-frequency electrical energy.

FIG. 1.

For instrument and meter calibration, heavy high-frequency currents are often required, the actual amount of electrical energy dissipated being comparatively small.

In the case of tests on insulating materials to ascertain dielectric strength and dielectric losses, high-voltage high-frequency is often necessary, although in this case also the amount of electrical energy required is small.

Two pliotron oscillator arrangements for high-frequency are described, the first for the production of relatively large current and the second for the production of relatively high voltage. In each case the amount of energy involved is comparatively small, of the order of 150 watts or less.

In a resonance circuit the current will rise until the losses become equal to the input energy. With practical circuits the lower limit of power factor obtainable is about one half of 1 per cent., unless unusual precautions are taken. This means that the maximum resonance current produced is about two hundred times the value of the true energy current fed into the resonance circuit.

Therefore, where large currents are desired from a small quantity of energy, the total volt-amperes of the circuit must be kept small; and this condition requires that for such a resonance circuit a large capacity and small inductance must be used.

It is also important to adjust the resistance of the load to the voltage of the supply so that the energy is most economically utilised. This means that the resistance of the heavy-current circuit must be given the apparent value most suitable for insertion in the pliotron circuit. This adjustment of apparent resistance is accomplished by electromagnetic coupling or transformer action.

The diagram of an arrangement to produce currents of from 10 to 25 amperes from one pliotron tube at frequencies between 100,000 cycles and 1,000,000 cycles is shown in fig. 1.

Suppose it is desired to calibrate a hot-wire ammeter by

means of direct comparison with a standard. These two ammeters are represented by A and A_1 , and are connected in series as part of a resonant circuit, the inductance and capacity of which are shown at L_3 and C_3 respectively. The product of the values of L_3 and C_3 to be used for any particular case is found by the usual resonance formula— $f = 1/2\pi \sqrt{LC}$.

As mentioned above, a low power factor and volt-ampere product is desirable; and therefore the inductance value of L_3 is made the minimum possible, consisting usually of only one or two turns of heavy conductor. With the range of frequencies specified, this gives values for C_3 of the order of about 0.1 microfarad. In this heavy-current circuit it is, of course, very necessary to use condensers of low energy loss, and to reduce the ohmic resistance of the conductors to a minimum.

The inductance L_3 obtains energy by electromagnetic coupling from the coil L_2 , which is connected in the plate circuit of the pliotron.

By means of an adjustment of the values of L_1 , L_2 , and C_1 , the pliotron system can be made to set up a high-frequency current corresponding in period to the tuned heavy-current circuit.

Owing to the relative values of L_2 and L_3 , the apparent resistance in the plate circuit of the heavy-current load circuit is greatly multiplied, but still is not of a sufficiently high value to absorb all the available energy. Further to

FIG. 2.

increase this apparent resistance, a variable capacity C_2 is shunted about the inductance L_2 . Then, by simultaneous variation of these two factors, the apparent resistance of the load can be adjusted to give the largest energy output available.

The heavy-current output is dependent upon the voltage of the direct-current source n , a useful range being between 200 and 750 volts. Pliotrons may be operated in parallel to produce a load current larger than that obtainable from one tube.

For the production of high voltage in a resonance circuit, the conditions are almost the reverse of those in a heavy-current circuit; that is, with a fixed value of inductance and capacity to give the desired frequency, the capacity must be small and the inductance relatively large.

A pliotron oscillator arrangement for the production of high voltages is shown in fig. 2. The high voltage is obtained across the condenser C_1 , and may be tested by the gap G . A condenser in the form of two metal plates suspended in air* is the most convenient, and it may have a capacity value between 20 and 200 micro-microfarads for a frequency of 100,000 cycles. With a hot-wire ammeter A in circuit with the condenser, and knowing the frequency, the voltage produced across C_1 may be simply calculated.

The inductances L_1 and L_2 are similar, and each has a value of about 8 millihenries. The invariable inductances L_3 and L_4 are also similar to one another, and each has a maximum value of about 2.5 millihenries.

The object of having L_4 variable is for the purpose of applying the high-frequency energy from the pliotron to the resonance circuit at the correct voltage, so that the energy

available is used most advantageously in the resistance of this circuit. The inductance L_3 is made variable, so as to supply to the grid just the right amount of high-frequency energy to make the system self-exciting and to excite it in the most efficient manner.

As in the case of the arrangement for heavy currents, a suitable range of potential for the direct-current source is from 200 to 750 volts.

With such values of inductance and capacity that a frequency of 100,000 cycles is obtained, a voltage of 12,000 may be produced from one pliotron tube operating from a direct-current source of 500 volts.

Pliotron tubes may be operated in parallel for the production of a voltage higher than that obtainable from a single tube.

A NEW HIGH-TENSION METER.

UP to the present, "high-tension" electricity meters have consisted simply of low-tension meters coupled to the high-tension circuit by instrument transformers, and subject to various errors and inconveniences due to the use of these transformers. The trend of modern power generating and distributing policy is such that it is necessary to have tariffs on high-tension current and to measure consumption in front of the consumer's step-down transformers. The meter described below* contains only low-tension components, but it avoids the use of instrument transformers by using in their stead the consumer's step-down transformer itself. The energy $P_h \cdot t$ delivered during a time interval t to the high-tension terminals of this transformer is given by:—

$$P_h t = P_l t + P_o t + [R_2 I_2^2 + R_1 (I_1 - I_o)^2] \cdot t \\ = (P_l + P_o + P_r) t$$

where P_l = power at low-tension terminals of the transformer; P_o = light-load losses of transformer; R_1 , R_2 = resistances of high-tension (primary) and low-tension (secondary) windings respectively; I_1 = primary current; I_o = light-load primary current; I_2 = secondary current; $P_r = R_2 I_2^2 + R_1 (I_1 - I_o)^2$.

This method of measuring the energy delivered to a transformer is on the same principle as the separation-of-losses method of

FIG. 1.

measuring power and determining efficiency during tests on electrical machinery or transformers. The measurement of $P_l t$ is effected by an ordinary low-tension meter, and that of $P_o t$ and of $P_r t$ is effected by special components, which may constitute a separate meter with its own train, or operating on the same train as the main low-tension meter. It is best, however, to let the special components act directly on the moving element of the main meter. This meter is then subjected, directly it is connected in circuit, to a relatively large driving torque due to a distinct element or part. Further, since the light-load losses of a transformer are practically constant, the starting torque on the meter is also constant. This simplifies and makes more accurate the adjustment of the main meter at all loads, and avoids the difficulty otherwise experienced in securing accurate adjustment at low loads. The danger of creeping and the effect of friction on starting are avoided.

Fig. 1 shows diagrammatically the special components recording $P_o t$ and $P_r t$ (the ordinary windings recording $P_l t$ are omitted for simplicity) in a single-phase meter recording the energy supplied to a single transformer. In this figure, A represents the main moving element of the meter, which may be a motor meter or a rotating-field meter; D is a metal disk, on the same spindle as A , and acted on by windings EE , FF , which record respectively $P_o t$ and $P_r t$. The windings EE are of different reactances, connected in parallel between the two secondary mains. If U_2 be the secondary p.d. of the transformer, r, r' the resistances of the two coils EE , and

* Two metal plates, each 10 in. by 10 in. and spaced $\frac{1}{4}$ in. apart, give a condenser having a capacity of approximately 10 micro-microfarads.

* From a paper by P. F. Dufour, *Rev. Gén. de l'Electricité*.

ϕ, ϕ' the phase displacements of their currents with regard to u_2 , the driving torque exerted by E on D is proportional to $(u_2^2/r^2) \cdot \cos \phi \cdot \cos \phi' \cdot \sin (\phi' - \phi)$. Again, if u_1 be the primary P.D. of the transformer, and θ_0 the phase difference between u_1 and i_0 , the light-load loss of the transformer is given by $P_0 = u_1 i_0 \cdot \cos \theta_0 = (u_1^2/R_1) \cos^2 \theta_0$. On light load $u_2 = m u_1$ (where m = light-load ratio of transformation); and in order that the driving couple produced by E may be proportional to P_0 , it is sufficient if $\cos^2 \theta_0 = \cos \phi \cdot \cos \phi' \cdot \sin (\phi' - \phi)$. The angles θ_0, ϕ and ϕ' vary with frequency and with the self-induction of the transformer and the coils EE. By adjusting the core saturations of the latter, the desired relationship can be obtained within the necessary limits. Also, the variations in $\cos \phi$ and $\cos \phi'$ can be made practically proportional, so that our desired relationship becomes $\cos^2 \theta_0 = \cos^2 \phi \cdot \sin (\phi' - \phi)$, which is realised by making $\phi = \theta_0$ and giving to $\sin (\phi' - \phi)$ a value near enough to unity so that a relatively large variation in $(\phi' - \phi)$ corresponds only to a small variation in its sine.

When the secondary of the transformer is loaded, the ratio of transformation is no longer constant but varies with the intensity and phase of the secondary current. Hence, in order that EE may continue to yield a driving torque proportional to P_0 , it is necessary to apply a correction to its field proportional to i_2 and to a function of the phase displacement θ_2 between i_2 and u_2 . As shown by fig. 2, u_2 is the resultant of $m u_1$ and the total voltage drop v_s . The angle $s o v$ is so small in practice, that $o s$ may be taken as equal to its projection on $o v$, hence $u_2 = m u_1 - K i_2 \cos (\theta - \theta_2)$, where $K = \sqrt{[(R_2 + m R_1)^2 + \omega^2 (L_2 + m L_1)^2]}$, and is practically constant in industrial practice. Transposing this expression for u_2 , and substituting the value for u_1 in $P_0 = (u_1^2 \cdot \cos^2 \theta_0)/R_1$, we have that $P_0 = u_2^2 \cdot \cos^2 \theta_0 + A \cdot u_2 i_2 \cos (\theta - \theta_2)$, very nearly, where A is a constant. In other words, we have to apply a corrective torque proportional to $u_2 i_2 \cos (\theta - \theta_2)$. This may be done by adding to the coils EE, a winding connected in series with one of the phase wires, or in shunt with a resistance so connected (e.g., in shunt with one or both of the windings FF). The corrective winding may be arranged to compensate the field of each of the coils E, so that these fields remain as nearly as possible proportional to the primary pressure u_1 , or it may be in the form of a special coil which, together with the coil (or coils) E and the disk D, forms a small rotating-field meter yielding a torque proportional to $u_2 i_2 \cos (\theta - \theta_2)$. The two systems EF make possible adjustment to compensate for small errors involved by the assumptions made above.

Instead of using one coil, E, and a winding traversed by all, or part, of the current i_2 , the corrective torque may be provided by

Fig. 2.

one of the coils F, and a coil mounted in series, or in parallel with the whole, or with one of the coils E. Or, yet again, the two systems EF may be so arranged that their reciprocal reactions on the currents which they induce in the disk D, yield the requisite corrective torque without the aid of a special winding.

The coils FF (fig. 1) are of different reactances, and are connected in parallel with each other and in series with one of the secondary mains. These two coils exert on the disk D a driving torque proportional to $i_2^2 \cdot \sin \alpha$, where α is the phase displacement between the currents traversing the coils. The angle α varies only with the frequency (the coils having no iron cores), hence the torque due to FF may be taken to be proportional to i_2^2 . Now, since $i_2 = (i_1 - i_0)/m$ (where m = ratio of transformation on light load), the term $P_r t$ in our original formula also varies with i_2^2 , and is therefore metered by the elements FF acting on D. The small error made in assuming $\sin \alpha$ to be constant is compensated by certain other assumptions made in connection with the system EE.

Fig. 1 and the preceding remarks refer to a single-phase meter, but the same principles and analogous arrangements apply to poly-phase instruments. Where it is desired to meter high-tension energy supplied to several transformers, as many systems EE, FF may be employed, or single systems EE, FF may be provided, with superposed windings or multiplying relays, &c. It is, however, simpler, safer, and altogether more satisfactory to provide each transformer with an independent meter. The range of loads on the individual meters is smaller, useful data are obtained concerning the distribution of consumption between the several transformers, the risk of stoppage or imperfect operation of a meter is divided, and the extra cost of individual meters is not serious.

Meters of the new type here described need not be much more costly than ordinary low-voltage meters, since they have no additional mechanical complication except, perhaps, the second disk. The additional components are exclusively electrical, and contain no permanent magnets. There are no fresh sources of error or accident. On the contrary, the supplementary electrical components provide additional means of adjustment and compensation.

It may be objected that the meter described is not really a high-tension instrument; nor is it, in the narrow sense of these words. It does, however, meter high-tension energy, and is at least as much a high-tension meter as those at present in use with current and pressure instrument transformers. The advantages of using the robust main transformer in place of special instrument trans-

formers are manifold. Instrument transformers are fragile, owing to their low power (compared with the high pressure for which they must be built); and they involve corrections which are, if anything, more complex and difficult than those described above.

It is possible to extend Duntour's principle of metering to measure, from any point in the low-tension secondary circuit, the energy received at any point in the high-tension circuit. So far we have arranged that the system EF (fig. 1) measured the transformer copper losses not included in the light-load losses (i.e., $P_r = R_2 i_2^2 + R_1 (i_1 - i_0)^2$). We can, however, just as well adjust matters so that EF records $P_r t = [(R_2 + r_2) i_2^2 + R_1 (i_1 - i_0)^2] t$, where r_2 is the resistance of part of the external circuit of the secondary. Then the meter placed at any point in the secondary line records energy delivered at the high-tension terminals of the transformer. Conversely, the meter may be made to register the energy, corresponding to a point in the secondary line ahead of its terminals, by reducing the constant of the system EF by an amount proportional to the resistance of the circuit between the meter and the point concerned.

Similarly, if r_1 be the resistance of a certain section of the primary (high-tension) circuit, the system EF may be made to record $[(R_2 + r_2) i_2^2 + r_1 i_1^2 + R_1 (i_1 - i_0)^2] t$, i.e., the energy passing a certain point on the high-tension line supplying the transformer. By applying a pair of windings EF designed and connected as above, any ordinary low-pressure meter placed at one point in a line can be made to measure the energy passing any other point (real or fictitious) in the line. One is thus able, in any case :

(1) To place the meter where most convenient from the point of view of accessibility or safety, &c., whilst still remaining strictly within the terms of the tariff in force. (2) To accept or establish tariffs based on energy received or delivered at some other point in the line than the location of the meter, even at some fictitious point in the network. This may have frequent useful application in connection with the sale or interchange of energy from network to network, and is worthy of special consideration in connection with recent linking-up schemes.

The new meter offers a cheaper substitute for equipments hitherto employed; permits even small consumers to be supplied on the basis of a "high-tension tariff," and facilitates double metering, which is always a desirable precaution where large consumers are concerned. In its various modifications, the new meter should make feasible tariffs best adjusted to the varied and numerous needs of practice.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

Industrial Switchgear, and Limit Switches.

MESSRS. GEORGE ELLISON, of Wellhead Lane Works, Perry Barr, Birmingham, have developed a range of totally-enclosed industrial unit type switchgear, for D.C. and A.C. circuits up to 1,000 kW, at 750 volts, and suitable for use in factories and mines. Each unit

FIG. 1.—ELLISON 3-PANEL INDUSTRIAL SWITCHBOARD.

is self-contained, consisting of an oil breaker bolted to a steel chamber, which contains the isolating switches and bus-bars, and carries the necessary instruments, interlocking gear between the isolating switches and the breaker, and cable fittings. The units are supported by cast-iron stands, and are bolted together to form a totally-enclosed switchboard, capable of withstanding the weather

and rough usage. Fig. 1 shows a three-panel switchboard of this type, for an incoming feeder and two outgoing lines, and fig. 2 shows the interior of the bus-bar chamber, in which the bars are clamped to mica-covered steel rods. The strong construction obtained by this design enables the board to endure distortion without fracture or damage to the insulation, as when, for instance, a fall of roof in a mine has broken the stands without

FIG. 2.—INTERIOR OF BUS-BAR CHAMBER.

interrupting the supply or necessitating costly repairs. The interlock between the isolating switches, breaker, cover, and tank is complete. A variety of control apparatus for motors can be combined with the switchgear, which is also made in several sizes.

A line of totally-enclosed self-resetting limit and emergency switches for cranes, &c., has also been introduced by Messrs. Ellison. These switches are either normally open or normally closed, according to requirements, and return automatically to the normal position after each operation, being actuated by a tappet

FIG. 3.—ELLISON LIMIT SWITCH, HAND-OPERATED (FRONT COVER REMOVED).

moving in any direction, or, if desired, by hand. Fig. 3 shows the No. 2 switch, hand-operated, with the front cover removed. The fixed contacts are large copper buttons, which may be rotated to equalise wear, and the moving contact is a substantial copper roller mounted to swivel and rotate, so as to bed on the fixed contacts; the mechanism is of double toggle type with no intermediate position, and sticking is impossible. The tappet may travel at practically any speed, and the switch may operate as often as 60 times a minute. The smaller size carries 5 amperes, and the larger 40 amperes, continuously, with large overload capacity on intermittent loads.

A New Generator of Static Electricity.

MR. W. H. CHAPMAN, of Portland, Maine, in U.S. patent No. 1,202,672, offers a remedy for loss of electrical and mechanical efficiency in static electricity generators. The invention consists in bringing a solid body of insulating material into intimate contact with a conducting liquid such as mercury which will not adhere to its surface, and then separating the solid body from the liquid and collecting from the surface of the solid the charge generated thereon. The rotating disk is partially immersed in the mercury. The inventor has found that a glass plate 8 in. (20.3 cm.) in diameter, making 80 R.P.M. and dipping into a mercury trough to a depth of 1½ in. (3.7 cm.) without induction plates will develop a potential of 9,000 volts on comb points, arranged to collect the charge at the top of the plate. The application of induction plates in proximity to the revolving plate at the point where it leaves the mercury raises the potential to 13,000 volts or more on the comb points and gives sparks ½ in. (1.9 cm.) long. This is still further increased by covering the induction plates with a thin sheet of rubber or glass. In order to

increase the quantity of electricity generated, a number of glass plates can be mounted on one shaft and separated by washers and all then dipped together into the one trough of mercury.—*Electrical World.*

A Large Arora Fire.

In spite of all the difficulties in the supply of labour and materials at the present time, we are informed that the sales of Arora fires have continued to increase, and have already doubled the output for last year, with the heavy season still to get through. The accompanying illustration shows a special fire which Mr. Robertson requested the ARORA CO. of Loughborough, to build up for the Mayor's parlour at Salford Town Hall. This has been already fixed in position and is reported to give great satisfaction

FIG. 4.—ARORA 75-KW. FIRE AT SALFORD TOWN HALL.

The makers have built up a special frame-work to match the existing fire-place, which is of antique brass, surrounded by tiles. The heating elements consist of ten of their standard 750-watt bars, arranged in two columns of five bars. Two separate circuits are taken to the fire, so as to balance the heating elements across the two sides of the three-wire system. Each side is worked at a pressure of 220 volts and controlled by two switches external to the fire. Probably there are few electric fires working under one frame on a 440-volt supply.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

A Static Electricity Phenomenon.

We think the following experience may be of interest to your readers.

One of our men working at a brewery was informed that our wires were leaking on to a boiler, and that their men were getting shocks from the valve. On examination, he found that there was no electric light in the boiler house, although some cables were carried through in steel pipes; these were earthed, and no leak was found on the wires. He came back and informed us that the packing of the boiler was charged, and we found this to be a fact.

We obtained a ½-in. spark by placing an iron rod from the packing to the valve, and the same from the packing to the top of the boiler after cutting away the packing.

There was a slight leak at a joint in a steam pipe above the boiler, and a small jet of steam played on the top of the boiler.

This we considered might be the cause, and we found it was so. On stopping this escape with a sack the discharge ceased; it returned, however, on taking the sack away. We tried this four or five times with the same result.

Perhaps some of your readers have experienced the same thing or a similar effect. The boiler is a Galloway type working at 120 lb. pressure, and is in a very confined space.

J. O. Grant & Taylor.

London, E.C., September 13th, 1917.

[No doubt the charge was generated by the friction of the slightly moist jet of steam on the boiler covering the effect discovered and investigated by the late Lord Armstrong. While the combination of circumstances necessary to enable a charge to accumulate is probably very rarely met with, it is worth noting that very high potentials may be attained by the charge, and sparks may occur, which, in the presence of inflammable gases or materials, may give rise to fires or explosions the cause of which remains a mystery.—
EDS. ELEC. REV.]

An Editorial Advisory Council.

Though we are far from desiring to see the British Government everywhere adopting or imitating the innovations of Allied or other Governments, we think the Premier might well take a leaf out of the book of Governor Whitman, of New York State. The Governor recently met in conference the editors of the various technical journals in the State, desiring to get reliable evidence upon questions of mechanical production, transport, coal and timber conservation, the provision of machinists and tool makers, and other vital factors essential to the successful prosecution of the war. As a result, the Governor has now a Committee of five editors acting in an advisory capacity.

Perhaps no class in the community has its fingers more completely upon the pulse of British industries than the men who so worthily and efficiently edit our Technical Press, and we feel sure they might with advantage be called in to the State Councils, where accurate information is, above all things, essential. At such a moment as this, when, to take only three important branches of public service—the air, agricultural, and marine departments—there is urgent need for the wisest and sanest counsels, as well as driving forces, we think nothing but good could come by the introduction of editorial assistance.

Scale on Evaporative Condenser Tubes.

Could any of your readers inform me through the medium of your paper of some effective and expeditious method of removing hard scale deposited on the exterior of evaporative condenser tubes?

The circulating water, which is drawn from a well, contains 35° hardness, and the deposit is most difficult to remove with chipping hammers.

Central.

War Bonus for W.O. Station Engineers.

According to an advertisement in this week's REVIEW inserted by the "Northern Command," the question of a war bonus for the engineering staff is under consideration. It must have come as a great surprise to a large number of your readers that the "War Office" have, after over three years of war and high prices for food, decided to fall in line with private firms and other Government departments.

It seems, under the circumstances, that while other engineers in other power stations have been receiving from 5s. to 12s. per week war bonus, the War Office still lag behind those to whom they should show the way.

Now that a brain wave has at last reached the mighty ones, their engineering staffs all over the country will at last receive fair play (perhaps).

In one "War Office" power station of my acquaintance, certain members of the staff are receiving lower pay *now* than was paid in December, 1915.

Had Some.

Re the Fusing of an Electric Wire.

In the article headed as above in last week's ELECTRICAL REVIEW, your correspondent mentions an electric iron which had burnt $\frac{1}{2}$ in. into a table, and suggests how nearly there had been a fire. In an experience extending over 15 years, I have yet to see a single instance of an electric iron setting fire to a wood table top or wood floor, and am prepared to make a small bet that it is impossible.

Usually the trouble is discovered by the strong smell and smoke, but in one instance which came under my observation, a 200-volt 16-lb. goose iron was left on in the workroom of a lock-up shop, the iron standing on a bath brick on a 2-in. oak table; and when the shop was opened at 8.30 a.m. the following day the shop and workroom over were filled with a dense smoke (the smell lasted for weeks), and the iron was found still on. It and the brick had gone through the 2 in. of oak and left a hole large enough for two irons to go through. The brick and iron parted company on reaching the floor, the brick making a substantial mark where it settled; the iron, keeping busy, had landed exactly over a 9-in. x 3-in. joist, gone through the floor board and about $\frac{1}{2}$ in. into the joist when

found. The iron is still in use, and the shop is Mr. Gordon Kennett's, Oxford Road, Manchester.

The possibilities of fire being caused are very remote, provided that (I am speaking of domestic electric wiring) the gas pipes are disconnected or removed altogether. I know of a dozen instances where, due to trouble occurring in the wiring, a spark from a tube or metal sheathing to a gas pipe has burnt a small hole in the pipe, lit the gas, and as the lead was melted so the flame ran back under the floor the whole width of a room. The spark which started the trouble would not have ignited a piece of tissue paper, much less a floor board.

E. O. Walker & Co.

Manchester, September 17th, 1917.

STANDARD CLAUSES FOR STREET LIGHTING SPECIFICATIONS.*

In December, 1910, a Committee was appointed by the Institution to prepare a Standard Specification for Street Lighting. The Committee was subsequently enlarged by the addition of representatives of the Institution of Gas Engineers, the Institution of Municipal and County Engineers, and the Illuminating Engineering Society.

After certain preliminary clauses had been agreed upon, selected London streets were classified by municipal surveyors serving on the Committee, and photometric measurements were taken in each of them.

The results obtained were embodied in further clauses which appeared to be generally acceptable to all the members of the Committee, subject to the settlement of a fundamental difference of opinion between the gas engineers and the remaining members of the Committee as to the character of the illumination on which the specifications should be based.

The opinion of the majority was that the proper basis is to call for "minimum horizontal illumination," and this was incorporated in an interim draft for the consideration of the Councils concerned. Counter proposals that "candle power" should be the basis were received from the Institution of Gas Engineers, but the specification was substantially accepted by the Councils of the Institution of Municipal and County Engineers and of the Illuminating Engineering Society, and also by the electrical representatives on the Committee.

With the object of thoroughly ventilating the question, in the hope that some means might be found of reconciling the views of the majority with those of the minority, the specification was discussed at a general meeting of the Illuminating Engineering Society on April 15th, 1913, in the form of a paper by Mr. A. P. Trotter containing the draft.† The views there expressed were considered at subsequent meetings of the Committee, when it became evident that the two bases proposed were irreconcilable, and that unanimous adhesion to either basis would be unobtainable.

Further efforts have been made to frame such a clause as would be acceptable to the minority, but without result; and as the matter has now been under consideration for over six years, it has been decided to publish the specification as it now stands as a Majority Report. It is hoped that it may be found useful when the methods of street lighting are reviewed after the war.

In a statement by the minority of the Committee, the Council of the Institution of Gas Engineers formally express their opinion that contracts for street lighting should be based on the average candle power of light sources ascertained at two or three defined angles. This, in the opinion of the Council, is the simplest and most correct method, and, moreover, would avoid the possibility of disputes arising from the more or less uncertain measurement of minimum horizontal foot-candle values.

The standard clauses for inclusion in a specification for street lighting are printed in full in the *Journal*.

Clause 2 states that the specification is based on illumination, the unit of measurement being one foot-candle.

Clause 4, the subject of disagreement, states that the "minimum illumination" of a street means the minimum illumination on a horizontal plane at a height of 3 ft. 3 in. above the ground level, and may be measured by means of:—

- (a) Any suitable illumination photometer, or
- (b) Any suitable photometer adapted for use in the street which will measure the candle power of the lamps in those directions which meet at the point of minimum illumination. In this case the minimum illumination will be calculated by adding together the values of the illumination received from each lamp that materially contributes to the result.

Clause 13 includes the following definition:—

"When a minimum illumination or candle power of lighting unit is specified it shall be held that such minimum is obtained if the average of the measurements of any three minima between consecutive lighting units of the same type does not fall below it."

In an appendix a table is given, which was originally calculated by Mr. Haydn T. Harrison to show the candle power required to produce a minimum illumination of 0.01 foot-candle on a horizontal plane 3 ft. from the ground, midway between two lamps of a given height and distance apart, and which has been recalculated by Mr.

* From the *Journal* of the Institution of Electrical Engineers. Abstract.

† See ELECTRICAL REVIEW, April 25th—May 16th, 1913.

M. Wilson, of the Board of Trade, for a height of 3'28 ft. instead of 3 ft. 3 in. referred to in Clause 1, thus approximating more closely to the metre. The difference in the result, less than half of 1 per cent., is inappreciable.

WAR ITEMS.

Trading with the Enemy.—In the "London Gazette" for September 11th, further lists appear of persons and bodies in the following countries with whom trading is prohibited: Argentina, Paraguay and Uruguay, Bolivia, Brazil, Central America, Chile, Ecuador, Greece, Morocco, Netherlands, Netherlands East Indies, Norway, Peru, Spain, and Sweden.

St. Dunstan's Scheme Extended.—Sir Arthur Pearson is setting on foot a scheme for raising £250,000 for extending the splendid work that has been done at St. Dunstan's for blinded soldiers, so that a provision of 5s. per week may be made for present and future children (up to the age of 16) of these blinded heroes. Donations may be sent to Sir Arthur at 221, Great Portland Street, London, W.1, marked "Blinded Soldiers' Children Fund."

Electric Supply Restrictions in Germany.—The "Times" states that now that "summer-time" has come to an end, Germany is organising new schemes of "daylight saving" for the winter, in order to economise fuel and artificial light. Notice has been given by the General in Command of the Münster Army Corps District that the consumption of gas and electric power in shops, restaurants, and so on must this winter not exceed one-half of the consumption in the winter of 1915-16. All the military and civil authorities, businesses, and other private undertakings are required to alter their office hours, from October 1st onwards, to the time between 8 a.m. and 4 p.m. Schools will keep the same hours. The lighting of shop windows and the use of passenger lifts are forbidden, and all restaurants are to be closed at 9 p.m.

Glow Lamp Cards in Germany.—According to reports from Germany, the manufacture and sale of glow lamps are to be placed under restrictions by the Government, and the export trade in particular is to be limited. The exports are stated to be of considerable amount, and lower prices are obtained abroad than can be demanded in Germany itself. At the same time, the suspicion exists that German lamps find their way *en* neutral to hostile countries. The business in Germany is to be regulated by the introduction of lamp cards. Since the recent establishment of a general understanding in the lamp trade prices have again been advanced by 20 per cent., and are now higher by 40 per cent. than prior to the war, wire lamps having remained the only department in the electrical industry that had been compelled through competition to adhere to pre-war prices until the new agreement was brought into operation.

The Germans in Belgium.—We are indebted to the *Ironmonger* for the following interesting paragraphs received from our contemporary's correspondent serving with the Belgian Army:—

"An enormous stock of agricultural implements, sewing machines, and other articles has been amassed at the electrical works of Duhait, at Charleroi. All this material, which has been collected in Northern France, and is locally known as the 'industrial bazaar,' makes a dump three-quarters of a mile long. It is reported that trains full of the stuff, which is first put in a state of repair, are being sent to Germany."

"As long ago as May 25th the Germans dismantled the plant of the Angleur Steelworks, and announced their intention of removing the travelling cranes. By order of the invaders, the blast furnaces of Ougrée had to stop work on May 24th, and the Germans are now dismantling the plant there also to send it to Germany. The Cockerill works at Seraing had in some measure been spared, but several hundreds of German workmen recently arrived there from Westphalia and proceeded to strip the place. Other industrial works which are reported to have been wholly or partly stripped are the Usines Boël (La Louvière), La Providence, Monceau St. Eloi, Société de Thy le Château, Usines Métallurgiques du Hainaut, Usines Henriot, Usines de Sambre et Moselle, Aciéries de Charleroi, and Usines Bonehill (Houmpies). At these works the Germans are removing the rolling equipment (cylinders made of high-grade cast-ings), shafting, belting, and even the foundation plates! The Germans are breaking up the big cast-iron posts to be recast. The big blowing machines of the Usines Bonehill and the Usines Boël, the four-cylinder machine of the Providence, which was exhibited at Liège International Exhibition in 1905, and the blooming-mill of the Providence Works are reported to have been converted into scrap iron."

Exemption Applications.—At Newcastle-on-Tyne Local Tribunal, on the 13th inst., Mr. E. Hatton, general manager of the Corporation tramway, asked that the case of a large

number of men, which were being reviewed by the military authorities, might be adjourned until suitable substitutes had been found for them. The Army authorities already owed the tramways 18 men to take the places of some who were with the Colours, and if more men were taken they would have to curtail the present tram service. As it was, complaints had been made by workmen in local shipyards as to the insufficient number of cars running, and the men had threatened to cease work if there was not a better service for them during the winter. It was stated that 91 tramway-men were called up; of these 47 had entered the Army, and 20 held protection certificates. Mr. Hatton said the present system was being maintained with great difficulty, and it was impossible to put women on as drivers with the present system of brakes. As the bad weather came on, and they had more sickness to contend with, the services would have to be curtailed if he could not get men. It was suggested that an appeal might be made for auxiliary drivers under the National Service scheme, and Mr. Hatton said he had already 100 men doing auxiliary work very satisfactorily. The cases were adjourned for two months, the authorities to find suitable substitutes.

At Burnley Tribunal, last week, the Military Representative asked for the review of the exemptions granted to 14 drivers in the Corporation tramways department. Mr. Jobling asked for the cases to be adjourned so that the whole of the 90 or so exemptions to tramwaymen could be reviewed together. The Tribunal, however, heard the cases. In four cases the appeals were adjourned for re-examination, and the Military Representative's appeal was allowed in the other cases, with varying periods of grace.

Conditional exemption has been allowed to J. McDonald (32), electrical engineer, of Ramsey (Isle of Man).

At Hull, the following decisions were arrived at in appeals for Corporation tramway employees:—Driver (22, C3), conditional exemption; car washer and motorman (37, C1), to join up on October 1st; driver (37, general service), exemption refused; driver (23, C1), to November 1st; driver (34, C3), conditional exemption; driver (C2), traffic clerk (C3), conductor (C3), conditional exemption.

On the appeal of Earl Amherst, exemption until December 31st has been granted to A. Kemster (38, B2), electrician on the estate at Chevington, Sevenoaks.

At the Cheshire Appeal Court, the Chester Corporation Tramways Committee sought further exemption for the traffic inspector, the only one left. It was stated that the man understood electrical equipment, and in case of breakdowns was employed to put things right. He was granted until January 1st.

A further three months' exemption has been granted at Bromley (Kent) to A. E. H. Dussek (31, C2), manufacturer of electrical insulating materials.

Chertsey Tribunal has refused exemption to C. T. Church (31, B1), electrical engineer.

On a military appeal, Essex Tribunal has withdrawn conditional exemption held by J. W. Collis (30, Class A), electrician, of Leyton.

Before the County Tribunal, the Military Representative appealed against conditional exemption granted to the chief clerk in the Derby Corporation tramway offices. Appeal allowed; calling up fixed for January 1st.

At Chatham, a review was made of the cases of five members of the staff of the Tramway Co., four being motormen and the other a cashier. Conditional exemption granted in each case. Notice of appeal given by the Military Representative.

The East Surrey Traction Co. appealed at Reigate for the retention of W. P. MacAlpine (37), motor fitter and electrician, claimed to be in a certified occupation. Three months allowed.

At Reigate, exemption was sought for A. J. Pribble (39), stoker and driver at the Corporation electric light works. The engineer (Mr. Ross) stated that they now had only two drivers and two stokers, and Pribble was a skilled man. Owing to a breakdown of the Diesel engine they were now using steam power. Conditional exemption granted.

At Lye, a business appeal was made by C. H. Bromley (33, B1), electrician, who stated that four of his staff had enlisted, one brother had been killed, and he assisted in his father's business in addition to carrying on his own. Three months conceded.

At the West Kent Appeal Court, the Military Representative appealed against conditional exemption granted locally to W. A. M. Paton (19, A1), engineer in the electric light department of Gillingham T.C. The appeal was assented to, and six weeks' exemption substituted.

At Bermondsey, Messrs. W. & R. Jacobs, manufacturers of electrical apparatus, applied for the exemption of a man in charge of their warehouse and staff, 31 years of age, single, passed as fit for garrison duty at home. The claim was disallowed, not to be called up before October 17th.

At Southwark, the Military Representative said he had received the latest instructions with reference to men holding certificates of exemption under the protected trades schedule, which were that he was not to oppose any application to the Tribunal for the exemption of a man who had his protection certificate withdrawn, so long as the application was made within seven days after he had received his calling-up notice to join the Army.

REVIEWS.

Practical Costing. By ARTHUR H. GLEDHILL, A.M.I.M.E.
London: The Gledhill-Brook Time Recorders, Ltd. Price 3s. net.

The author deals with the subject in a thoroughly comprehensive manner, and covers the ground from "Alpha to Omega." The system advocated so far as labour is concerned is automatic time-recording, and the "Clipper" time recorder is the medium. This instrument must not be confused with the ordinary "in" and "out" recorder, but is so designed as to record job costing, repetition work, repair work, &c.

In the introduction the author gives a number of essential points which should be carefully considered when starting a new costing system, amongst which he states truly: (1) That different classes of work require different costing systems. (2) The costing system should be arranged to give a maximum of detail information with a minimum of clerical labour and expense. (3) The workman is the wrong person to enter the time records. (4) That it is more efficient and less costly to put the work in the hands of a cost clerk with the aid of a time-recording clock for printing the actual times to the exact minute when jobs are commenced, finished, or broken off. The diagram, "Building up of a Selling Price," shows clearly manufacturing costs, &c., including unproductive labour costs—which is a most important item—giving each cost as a percentage of the whole.

Chapter I details clearly the routine necessary to start a job. The author analyses to a degree, and his dissection to a point may be unnecessary, but he shows how, if required, costing can be detailed minutely. The works orders first set in motion at the commercial end are very clearly illustrated. One portion, however, is not by any means clear. The author states: "To firms who have always worked hand to mouth, this method would probably occasion a stoppage of output for a few months, but those who have made the change agree that the increased output afterwards secured has amply repaid them." The reviewer cannot for one moment see how the adoption of any new method should have the result the author states. If an existing system is brought up to the end of any period it is simply a question of managerial control to put into operation a new system. No doubt, for a few weeks the management would have to pay particular attention to the method of operation, and it might necessitate the costing clerks having to make a few early-morning starts. It brings to the reviewer's mind the following few lines:—

"IT COULDN'T BE DONE."

"Somebody scoffed, 'Oh, you'll never do that,
At least no one ever has done it';
But he took off his coat and he took off his hat,
And the first thing he knew he'd begun it.
With a lift of his chin and a bit of a grin,
Without any doubting or quidding,
He started to sing as he tackled the thing
That couldn't be done—and he did it."

Chapter II is devoted to time records, showing different systems.

Chapter III deals with general labour costs, and touches upon unproductive labour cost. The reviewer is pleased to see the importance the author attaches to this item in this and subsequent chapters. In the reviewer's opinion there are too many cases where this particular factor is dealt with in a slipshod manner, labour recorded on the job, machine hours, material, and managerial charges, &c., going to make up the cost. As a matter of fact, unproductive labour may be looked upon as stand-by labour; it certainly has to be paid for, and is thus a direct charge upon all output; moreover, it is a factor, if truly recorded, which indicates how far it is possible to increase output without additional labour costs, machine hours and raw material being additional, but no increase is incurred in managerial charges or capital.

Chapter IV deals with hourly machine rates, giving examples of how to arrive at them, and dealing with running time, idle time, productive hours, &c. What the reviewer stated about unproductive labour records applies practically to unproductive machine hours, depreciation, interest, floor space, rents, rates, taxes, &c., being a direct charge, even when the machines are idle; therefore all costs should bear a proportion of this charge. Chapter IV, "Hourly Rates for Labour," shows very clearly the fallacy of flat-rate overhead-charge on labour, and gives a very interesting hypothetical basis for fixing hourly rates.

Chapter V, "Stores and Materials," gives briefly the method of dealing with this important department. The author could in this case have augmented the information to some advantage if he had dealt with the method in detail from the receipt of the raw material to the collection and assembly of finished parts.

Chapter VI, "Overhead Manufacturing Expenses." This chapter, coupled with the illustration, is very concise indeed.

Chapters VII and VIII, "Selling Expenses" and "Final Summaries of Costs," are clearly set forth in a very interesting manner, and the illustration showing periodical average costs is well worthy of study and consideration.

Chapter IX is on "Balancing Cost Accounts and Commercial

Accounts." This is a most important item, and, briefly, means that for every item of expenditure, unproductive labour, recovery of hourly rates, &c., a corresponding charge is made somewhere or other. The illustrations showing total sales compared with material, wages, productive and unproductive, other expenses, and profit are self-explanatory.

Chapter X, "Weekly Department Report," gives a very interesting summary of expenditure.

Chapter XI, "Manufacturing in Multiples of 60," contains something new and worth some little consideration, the calculation of the factors, quantity and time being reduced to a minimum, thus:—

60 articles made in 14.75 hours = 14.75 minutes per piece.
600 articles made in 11.75 hours = 1.175 minutes per piece.
30 articles made in 11.75 hours = 29.5 minutes per piece.
300 articles made in 11.75 hours = 2.95 minutes per piece.
And so on.

The concluding chapters, "Costs and Estimates," "Bonuses for Increased Output," "Dead Charges," &c., are dealt with in a very lucid manner, and the illustrations, showing a series of standing order number job cards printed on coloured cards, also production job cards and a weekly time card ruled on the back for analysis of jobs worked upon each week, and the labour cost of each, make the subject very clear.

In conclusion, the reviewer can recommend this book to all those interested in manufacturing costs, irrespective of whether their existing system depends on clock recording instruments or otherwise, as the author has dealt with this subject both theoretically and practically.—J. C. P.

How to Lay-out Turret Lathe Tools. By ALFRED HERBERT, LTD. Coventry: Alfred Herbert, Ltd. Price 2s. 6d.

Though somewhat to the nature of a trade publication, this handbook "for those who design tools for use on turret and capstan lathes and automatic turning machines" constitutes a decidedly useful addition to the literature on the subject.

Very few firms engaged on munition work are now manufacturing without machine tools of this type, of which vast numbers have been built or imported since the commencement of the war. The laying-out of such tools is a highly skilled job, but many workers are being called upon to tackle it with little more than an average shop experience. To such the present work cannot fail to be of value. Even the expert will find in it some useful hints, and valuable suggestions will be received as a result of a careful study of the 115 reproductions of photographs and drawings that the volume contains. Various typical lay-outs are described, e.g., the tools actually used on gun-metal fuse adapters, aeroplane propeller bosses, and motor-car flywheels.

The author wisely insists on the importance of lay-outs being as simple as possible, and embodying standard tools and holders. "Ingenious" tools are usually a poor economy.—G. S. S.

Underground Transmission and Distribution for Electric Light and Power. By E. B. MEYER. London: Hill Publishing Co. Price 12s. 6d. net.

The manufacture and laying of underground cables is a specialised branch of electrical engineering which involves very large expenditure. As compared with other branches of electrical engineering the literature is scanty, but this book goes far to fill the gap.

The subject matter is mainly treated from the American view-point, but there is also a good deal of information concerning standard practice in Europe.

After describing various forms of duct, the author states that tile and fibre conduits are now used almost universally, by which he means in U.S.A.

The first is made from vitrified clay, and when free from iron has high insulation, giving an average puncture test of 25,000 volts dry and 21,000 volts after immersion in water for several days.

Fibre conduit has been in use for about 15 years, and some that the author had occasion to examine after it had been in moist soil for 10 years showed no signs of deterioration. It is made of wood pulp which has been thoroughly saturated with a bituminous compound containing about 6 per cent. of creosote. The latter prevents rotting by killing organisms which might act on vegetable matter in the pulp. It will stand a puncture test of 32,000 volts dry, and 24,000 volts after immersion in water for about 200 hours. It is made in 5-ft. lengths, which are convenient for transport and handling in the trenches. The ducts are laid in concrete, about one inch being left between adjacent ducts.

In reference to armoured cable, the author says that in Europe this class of cable is practically standard for all underground systems. What he refers to as a large installation is in Central Park, N.Y. City, where 500,000 ft. of steel-tape street-lighting armoured cable has been laid.

Rubber, paper, varnished cambric, and other forms of insulation are described, and under the heading "Graded Insulation," the author says:—"The potential gradient of insulated wire is much higher in that portion near the conductor than in the outer layers, and the fall of potential

across a series of insulators of varying specific inductive capacity is inversely proportional to those capacities." By taking advantage of this law, a smaller diameter of cable may be used with the same factor of safety.

Under the heading of "Lead," reference is made to the lead-boring insect found in Australia and in the south-eastern portion of U.S.A.; also to the fact that slight traces of arsenic, antimony, copper, tin, &c., in lead are a benefit rather than an objection, as they tend to slightly harden the metal.

Owing to the fact that alternating current in large cables has greater density on the surface, it has been found advisable on single-conductor cables of large area to strand the copper wires on to a central fibre core.

Sector cables are described, and it is pointed out that a larger portion of the periphery of each conductor is nearer the lead sheath than in an equivalent round conductor. This allows a greater radiation, with consequent higher current density.

The chapter on installation of cables is good, many quite small, but necessary, details being illustrated and described—for example, basket wire-grips and flexible duct cleaners.

From one figure it is a little surprising to find that the cities of Milwaukee, Newark, Boston, Detroit, New York, San Francisco, Chicago, and Brooklyn have each their own particular methods of drawing in cables, and the differences are quite appreciable. Jointing is, of course, dealt with.

A good tip that is mentioned, is the practice of a company in the States of "putting up" all the materials for a cable joint in unit packages. The author thoughtfully gives a picture of the contents of such a package.

There is some original information on cooling of duct lines, and it appears that the Niagara Falls Power Co. cools its underground cables by circulating water through vacant ducts adjacent to occupied ducts. At Baltimore it was found that cable burn-outs were more frequent in summer. Therefore, in 1915, a sprinkler system was installed to keep the ground moist where the burn-outs mostly occurred. The results at the time of writing are said to be interesting, but not conclusive.

The cooling of underground transformers is referred to in the chapter on distributing systems, and the author says that 8 watts of transformer losses may be allowed per sq. ft. of wall space. In moist soil, with ventilated chamber, 12 watts may be allowed. In wall surface he includes the roof and floor.

Current-limiting reactances are described, and it is stated that they should be of the air-core type, and their capacity correspond to the full-load capacity of the line which they are intended to protect. They are generally built in with wood and concrete or porcelain.

Seven pages deal with selective fault-localiser, arcing ground suppressor, grounded neutral systems, and the Merz system of cable protection.

Electrolysis has a chapter to itself, and it is admitted that when this began to be serious American engineers did not have as thorough a grasp of the situation as did engineers in Europe. American practice has not sought to remove the underlying causes of electrolysis, but has attempted merely to relieve acute conditions. The measures adopted in addition to track bonding, have consisted of "pipe drainage" or bonds to other systems.

The author states that the usual method of protecting cable sheaths is by use of a drainage system similar to that used for the protection of pipe lines. The object of draining the sheaths is to make them slightly lower in potential than the surrounding earth or neighbouring structures, thus preventing current flowing off the sheaths. Since there is danger of overdraining in making the sheath potential considerably lower than that of the ground or adjacent grounded structures, it is sometimes necessary to insert suitable resistances in the drainage leads.

As with nearly all the books of the Hill Publishing Co., numerous specifications are interpolated in the text. Also, a good deal of information is given as to construction costs, &c. Occasional references are made to papers in which further information on a particular point may be found.—E.K.S.

High-Speed Internal-Combustion Engines. By ARTHUR W. TRIGG, Wh.Sc., A.R.C.Sc. London: Whittaker & Co. Price 15s. net.

It might be thought that the work of describing the internal-combustion engine had almost become one of supererogation, so many are the authors who have given us books upon this subject. But few of them deal fully with the high-speed side of the subject, generally confining themselves to the heavier, slow-speed types of engine. Of course, the high-speed engine is now of the utmost importance in these days of motor cars and aeroplanes, hence Mr. Judge's justification in enlarging upon the subject. He deals with the question chiefly from the theoretical side, but also gives many experimental data, especially where experimental work has influenced design. The data are not necessarily always original; often they have been brought together from widely scattered sources. In fact, to some extent, the volume under review constitutes a compendium of the literature on the subject, and the author is to be congratulated on the thorough-

ness of his classification. He skilfully analyses and presents in order and sequence the more important of the available theoretical and experimental results.

A practical point that emerges from his consideration of the question of pressures and temperature relates to the use of alternative fuels to petrol—a matter very much to the front at the present time. He shows that though in benzole, paraffin, and in alcohol we have excellent petrol substitutes, efficient use of these liquids cannot be made with existing engines. They must be redesigned if they are to give the best results. The need for this will be seen from Mr. Judge's statement that "the compression pressures required for the best results with paraffin as a fuel are about 75 to 85 per cent. of those of petrol, whilst with benzole compression pressures of 110 to 120 per cent. of those used in petrol engines are necessary for higher mean pressures to be realised." Alcohol, he shows, works most satisfactorily with compression pressures "varying from 150 to 200 lb. per sq. in." Since these compression pressures are about 100 per cent. greater than those employed in petrol engines, we can readily admit that special alcohol engines will be needed in the future if the best results are to be obtained from a fuel that there is reason to suppose will be very much to the fore after the war.—G.S.S.

BUSINESS NOTES.

Feed-Water Regulators.—MESSRS. SCHOLEY & CO., LTD., inform us that their Copes feed-water regulator, which we described some time ago, has been very largely adopted by steam users, whose experience of its use, judging by the reports of prominent engineers, has been very satisfactory indeed. The importance of maintaining a constant water level has not been fully appreciated in the past, but, in reality, a good feed-water regulator plays a part in relation to a boiler analogous to that of the governor of an engine, and prolongs the life of the boiler and pumps by preventing sudden changes of temperature and load due to irregular feeding.

Fire.—The workshops of Messrs. Gilbert Bros., electrical engineers, Navan, Co. Meath, containing a quantity of electrical fittings, was destroyed by fire on Friday morning last. The firm's plant was saved.

German Industrial Activity in Spain.—At the beginning of 1914 it may be said that Spain languished, and, excepting some industrial activity in Catalonia (Barcelona) and Gascony (Bilbao), there was nothing in the rest of the country to call for interest. The war has awoke the slumbering energy, and under the stress of necessity, individual and collective, here a little and there a little, but leisurely, led to the realisation of some progress. In 1913, Spain exported iron and steel goods to the value of a million and a-half pesetas; in 1916 these figures had risen to 57 millions. In copper the advance was from 8 to 21; firearms from 10 to 25; chemical products from 5 to 28; woven cottons from 3 to 28; textiles, 33 to 68; leather and skins, 2 to 31; machinery and railway plant, 4 to 17. Taking account of the increase in prices, there is here an indication of the multiplication of the capacity of production which affords the most eloquent explanation of the fact that in 1916 new companies were founded with a total capital of 230 million pesetas. It is certain that many of these were promoted by Germans, and with German capital, for it cannot be denied that, notwithstanding the war and the blockade, Germany has completed every step to continue its business operations with the whole world, making use of countries now neutral. Another awakening which may have its own importance is that of the mining industry. Spain is rich in mineral deposits, has abundant labour and cheap. She is richer, perhaps, than Italy in water resources, and has good coalfields. According to approximate calculations, Spain might avail herself of 6,000,000 H.P. of electric energy, of which to-day she only makes use of 80,000 H.P., notwithstanding that concessions have been granted for 1,000,000 H.P. The Government has taken important measures to foster the industrial development of the country. New industries can enjoy the help of the State, which is specially shown by fiscal advantages and exceptions, by concessions and privileges from State or State-supported banks, by State grants and loans at low interest, and by State guarantees of a minimum interest on capital invested. Moreover, the industries already existing may avail themselves of like advantages by turning out ships of over 10,000 tons burden or colliers, or occupy themselves with the extraction and treatment of iron, copper, zinc, or the cultivation of the products of the ground and the manufacture of chemical manures and agricultural machinery. Similar, and even greater, facilities are accorded the hydro-electric works of 1,000 H.P. and above, the chemical industry (chiefly colouring materials), and the manufacture of electrical plant and scientific apparatus. The wealth created in Spain by the war, the expansion of its industries, the not negligible help of the Government, and the competition of the German invasion with industrial productions with a Spanish label, will carry Spain forward for a number of years to a higher industrial level than might have been expected, making of her a possible competitor with other neighbouring countries, like Italy, but also an available market for their products as also a good field for action for their electrical engineering talent.—*L'Electrotecnica*.

For Sale.—Rhondda U.D.C. invites tenders for the purchase of a complete up-to-date private generating plant, recently installed by the Westinghouse Co. For particulars see our advertising pages.

Technical Advertising.—In the September issue of *Cheap Steam*, Messrs. E. Bennis & Co.'s magazine, there is an entertaining article on "The Troubles of an Ad-Man," by Charles Brangwyn. In the course of the contribution the writer says:

"In the face of facts which scream at him from every turn, the technical man—and the salesman, too—often looks upon advertising as an expensive fad, a luxury, or something worse, but always a superfluity. Not that he will always say so in words, for back of his mind he has a feeling that to do so would expose him to ridicule. 'Of course, we must do a little,' he will, perhaps, admit regretfully, but he doesn't believe in it. There is no faith behind his admission.

"Grant him that no advertisement ever of itself sold a steam turbine or a mechanical stoker, but what would the world know of any commodity without advertising? The advertisement is at work when the salesman is at rest, preparing the mind of the prospect as he sits by his own fireside where no salesman ever penetrates, it is talking to him in his office even while the traveller is being told 'too busy to see you this morning.' It is ever smoothing out the stony ground over which the salesman may afterwards travel with ease, impressing the name of the firm and the merits of its manufactures on the mind, so that at the moment of his need the buyer involuntarily thinks of the firm whose advertisement he has most often seen."

Book Notices.—*Useful Engineers' Constants for the Slide Rule*. Second Edition. Glasgow: J. A. Burns. Price 1s. net.—This little book is intended to show how the slide rule may be used to the best advantage by the practical engineer in technical or commercial calculations, with special reference to the use of special constants for repetition work on the rule. After a brief explanation of the ordinary slide rule, the author illustrates its application to a variety of mechanical, electrical, and hydraulic calculations, his object being rather to assist the reader in working out time-saving constants for his own use than to compile a large number of examples. A few tables of weights and measures, conversion tables, &c., are appended; in some of these, we think, the author errs by giving values running, in some cases, to as many as eight significant figures, where four would suffice for the slide rule (and for almost all practical purposes). It is a useful little work, very lucid, and admirably arranged and printed.

"Science Abstracts, A and B." Vol. XX, Part 8. August 30th, 1917. London: E. & F. N. Spon, Ltd. Price 1s. 6d. each.

"Practical Electric Illumination." By T. Croft. London: Hill Publishing Co. Price 8s. 4d. net.

"Wayleaves." By C. Vernier, M.I.E.E. Reprint from the *Journal of the Institution of Electrical Engineers*, with discussion. From the author.

C.C. Motors and Control Apparatus. A new text-book with this title has just been published by Messrs. Whittaker & Co., the author being Mr. W. Perren Maycock, M.I.E.E. The work comprises 330 crown 8vo. pages, and has about 150 illustrations and diagrams. In its writing, Mr. Maycock has had the assistance of Mr. E. Hughes, B.Sc. (Lond.), of the Heriot-Watt College, Edinburgh.

We have received a folder relating to Messrs. A. P. Lundberg and Sons' examinations in electric light switching, and containing extracts from letters showing the keen interest with which men on Active Service, as well as in civilian life, regard these exercises.

"Proceedings of the Incorporated Municipal Electrical Association, 1917." London: Wyman & Sons. Price 5s.

Trade Announcement.—In order to centralise their business, the STANTON IRONWORKS CO., LTD., are removing their office, on October 1st, from 44, Coal Exchange, E.C. 3, to Maxwell House, Arundel Street, Strand, W.C. 2. New telegraphic address, "Cobbles Eaststrand London"; telephone number, "Central 6808." Mr. Arnold Longden, who has represented the company for some years on the London Coal Exchange, will continue to supervise the company's interests at Maxwell House.

Catalogues and Lists.—MESSRS. SCHOLEY & CO., LTD., 56, Victoria Street, London, S.W. 1.—Pamphlet giving illustrated description of the Copes feed water regulators.

OVERSEAS ENGINEERING CO., LTD., 75, Curtain Road, London, E.C. 2.—Two circulars giving description, prices, &c., of their "Overseas" self-contained electric lighting plants.

Aluminium Works in Austria.—It is reported from Vienna that the Hungarian Natural Gas Co. (Erdgas Gesellschaft) proposes to establish an aluminium factory for the purpose of working up the bauxite deposits which are said to be situated in the vicinity of the company's natural gas mines in Transylvania. A new aluminium works is also projected in the neighbourhood of Innsbruck, whilst three other schemes for similar works are proposed in connection with the utilisation of Alpine waterfalls.

charges to £647, leaving a deficit on the year's working of £10,151. To this must be added the deficit balance brought forward, making a total deficit balance at March 31st last of £11,521. As compared with the previous year, the costs of generation, &c., increased by more than £8,000, due to the extra price of coal and labour. Total units sold 7,180,755, as against 6,731,932 in 1915-16; average price obtained per unit sold, 110d.; works cost per unit sold, 114d.; total all-in costs per unit sold, 1516d.

At a meeting, last week, of the Accrington and District Trades and Labour Council, a resolution was moved on behalf of the Steam Engine Makers' Union, requesting the B. of T. to inquire into the working of the Corporation electricity works, with the object of presenting a report to the burgesses, and of assisting the Corporation officials to place the undertaking in a better financial position. The resolution was agreed to.

Alva.—The Town Council is co-operating with the leading manufacturers in the town with a view to having electric power introduced.

Batley.—WAR BONUS.—A Special Sub-Committee of the T.C., after consideration of an application by the Corporation employees for an advance in war bonus, has decided to recommend an all-round increase, bringing the bonus up to 19s. per week.

Buxton.—PRICE INCREASE.—The T.C. has decided upon a war-time increase of 20 per cent. in the charges for electricity to all consumers, from the end of the current quarter.

Carlisle.—PRICE INCREASE.—The City Council has decided that the charges for electricity shall be increased by 10 per cent. from October 1st, except in cases covered by special agreements.

Continental.—SPAIN.—The Sociedad Hidroeléctrica de Pindo has recently secured a concession to establish a plant to utilise the water power of the River Dobra, in the Angón Valley (Province of Oviedo), in the generation of electrical energy for power purposes.

Dewsbury.—LIGHTING RESTRICTIONS.—The local Chamber of Trade last week decided to urge upon the West Riding authorities that 7 p.m. should be definitely fixed as the time for shop-lighting restrictions throughout the winter, or, in the alternative, that a definite uniform time should be fixed for the different months. It was held that there would be no need for obscuring lights at all if satisfactory arrangements could be made for extinguishing them promptly if necessary, and a Sub-Committee was appointed to interview the Chief Constable of the town to see if better shop-lighting facilities could be arranged.

Doncaster.—STRIKE NOTICE.—With further reference to the paragraph on p. 253 of our issue of September 14th, the Corporation was at first inclined to take no action, but it was announced last week that the matter, which had been referred to the Committee on Production, would come before an arbitrator on Friday, September 14th, and consequently the employees'—those concerned number nearly 300—suspended their notices pending the result.

Harrogate.—STREET LIGHTING.—The acting chief constable of the West Riding has sanctioned the lighting of a number of electric street lamps in the town, leaving the question of a possible further number in abeyance. The local Lighting Committee has decided that these lamps shall remain lighted throughout the night as from September 6th.

Hove.—YEAR'S WORKING.—The statement of accounts of the Council's electricity undertaking for the year ended March 31st shows receipts £23,487, expenditure £11,573, and gross profit £11,914, which, with income-tax refunded, totals £12,081. Interest, sinking fund, and income-tax charges, &c., absorbed £11,336, leaving a net balance on the year's working of £745. On the Aldington section the revenue account shows income £2,236, expenditure £1,423, gross profit £813; loan charges, &c., absorb £687, leaving a credit balance of £126.—*Sussex Daily News*.

The Electricity Committee places on record its appreciation of the able manner in which Mr. C. B. Smith has managed and carried on the undertaking during the war under most difficult circumstances.

Keighley.—PRICE INCREASE.—At the T.C. meeting, last week, the Electricity Committee recommended that in future sealed agreements for electricity supply entered into by the Corporation the price per unit be increased, as follows:—D.C. system (minimum annual payment £40), from 7s. 6d. to 7s. 7½d. per unit; three-phase high-pressure system, from 3d. to 3s. 7½d.; the present charge of £3 per kW. of maximum demand to continue. Mr. Sellers, moving the adoption of the Committee's accounts, said that the department's output had doubled since the beginning of the war, and coping with doubled business under war conditions was no light task. The lighting restrictions had caused a falling-off in units. Last year £5,612 had been paid out of revenue for repayment of capital, whilst the interest on loan charges had amounted to £3,194. The average price obtained for the whole supply had been 7s. 5d. per unit, which was 10d. less than last year; this was due to the larger output being given for power uses, whilst lighting units had shown a reduction. There was a net profit of £223.

Kilmarnock.—PROPOSED LOAN.—The T.C. is applying to the Scottish Office for power to borrow £80,000 for electricity purposes.

Launceston.—SUGGESTED PRICE INCREASE.—The Electric Supply Co. Ltd., has applied to the B. of T. for consent to increase the price of electricity for lighting from 6d. to 8d. per

LIGHTING AND POWER NOTES.

Accrington.—YEAR'S WORKING.—The annual statement of accounts of the Corporation electricity department shows gross revenue £35,775, expenditure £34,064, leaving a gross profit of £1,711, which, with interest on investment, totals £1,735; capital and income-tax charges, &c., amounted to £11,242, and special

unit, and for power and heating from 3d. to 4d. The directors have promised the consumers not to raise the price beyond 7d. unless special circumstances warrant it, and to consult the consumers before increasing the charges beyond 7d.

Leeds.—**SHOP LIGHTING.**—The Leeds Chamber of Trade last week unanimously decided to urge the Home Office to appoint a definite time for subduing shop lights during each month of the autumn and winter, in order to avoid the lack of uniformity and consequent trouble both to shopkeepers and authorities, which was experienced last winter.

Lye.—**STREET LIGHTING.**—The U.D.C. has decided to give the gas company six months' notice to terminate the public lighting contract, the idea being to substitute electricity.

London.—**ST. PANCRAS.**—**YEAR'S WORKING.**—The accounts of the electricity undertaking for the year ended March 31st last show a net profit for the year of £26,828. In anticipation of this balance, £5,000 was transferred in aid of the rates for the current half-year, and the Finance Committee holds that a further sum of £14,000 should be used during the ensuing half-year to meet the lighting portion of the Council's requirements, and to relieve the rates. This will leave a credit balance on the electricity revenue account of £7,828. The Electricity Committee considers that the increase in the price of electricity of 10 per cent. made at the June quarter, 1915, should be reduced to 2½ per cent., and that the resolution of the Council of June, 1916, respecting meter rents being charged on a sliding scale should be rescinded. It is estimated that these concessions will affect the revenue for the current financial year by about £8,000 in respect of the six winter months, during which the alteration will be in operation, and in subsequent full years by about £12,000 per annum.

POPULAR.—**YEAR'S WORKING.**—The annual report of the electrical engineer and manager, Mr. J. H. Bowden, shows that the energy sold amounted to 23,477,042 units, an increase of 1,970,128 units, or 9 per cent.; the net income from the sale of energy amounted to £103,878, an increase of 17½ per cent., and the working expenditure was £67,069, an increase of 28½ per cent. The gross profit was £36,808, an increase of £497 on the previous year; and, after deducting interest £11,382, repayment of loans £13,143, and sundry charges £899, there remains a surplus of £12,011, a slight increase over 1916. With the unappropriated balance of £8,596, there was a total surplus of £20,607; a sum of £3,393 was transferred to the rates, about £9,000 was applied to items of capital expenditure, alterations, &c., £1,262 to the staff as a bonus, and £686 was transferred to the superannuation and pension fund, leaving an unappropriated balance of £6,137 to be carried forward. The average price of coal rose from 17s. 11½d. per ton in the previous year to 20s. 5d., a difference of 2s. 5½d. per ton, which on a consumption of 37,247 tons is equal to £4,578; works costs rose from 0'58d. to 0'69d.; the average price obtained per unit sold was 1'062d., and if the bulk supply is deducted the price for energy sold in the Poplar area becomes 1'194d. The capital employed per kW. of plant installed is £324; the load factor was 30'11 per cent. compared with 30'2 per cent. in the previous year. The sale of energy for private lighting was 1,210,331 units, for domestic supply 935,414, for power 17,832,739, for bulk supply 3,294,711, and for public lighting 203,644 units.

Pinner.—**NEW MAINS.**—The Electric Light Co. has informed the Hendon R.D.C. that it intends to lay mains in various parts of the district.

Portsmouth.—**YEAR'S WORKING.**—The accounts of the Corporation electricity department to March 31st last show total revenue £53,301, an increase of £2,696; works costs £40,445, an increase of £4,625; gross profit £12,856, as compared with £14,784. Repayment and loan charges amount to £21,110, and income-tax and special charges to £854, making a total of £21,964, leaving a deficit on the year's working of £9,108, which has been taken from the reserve. The reserve fund now stands at £10,789. The cost of coal per unit generated has increased since the war began from '36d. to 1'65d., and the total works cost from 1'4d. to 2'6d. Total capital expenditure to date, £375,427; amount repaid, £225,744; a mount outstanding, £149,683.

Salford.—**STREET LIGHTING.**—The Lighting Committee proposes to make arrangements with the Electricity and Tramways Committee of the borough for the better lighting of the streets during the coming winter. It is intended to have a number of electric lamps, shaded from above, and suspended from the cross wires between the tramway standards. These lamps could be easily extinguished in the event of a warning.

Southend-on-Sea.—**SLOT METERS.**—With reference to a decision of the Electricity Committee that consumers of electricity through slot meters should be required to pay a minimum of 1s. per annum, the borough accountant has been instructed to require payment of a deposit of 15s. from all persons using slot meters who have not, during the last 12 months, consumed energy to the value of 18s., and that on and after October 1st it be a condition precedent to the hiring of slot meters that a deposit of 15s. be paid. The L.G.B. is to hold an inquiry into the application of the Council for sanction to borrow £45,520 for the provision of additional generating plant at the electricity works at the termination of the war.

Southport.—**WAGES AND SALARIES.**—The Corporation Electricity Committee has decided to increase the wages of the stokers from 4s. 8d. to 5s. 8d. per shift, and of the drivers from 4s. 8d. to 5s. 10d., exclusive of war bonus. It has been decided to

increase the salaries of the track superintendent, the mains superintendent, the two engineers in charge, and the chief clerk, these officials, it is stated, having had no increase for 10 years.

Weymouth.—**YEAR'S WORKING.**—The statement of accounts of the electricity department for the year ended March 31st last shows gross receipts £12,725, and expenditure £9,397, leaving a gross profit of £3,328; after making provision for repayment and interest charges of £4,393, there is a deficit on the year's working of £1,065; total capital liability £67,164, of which £23,719 has been repaid, leaving £43,444 outstanding. The Electricity Committee hopes that as the increased charges did not operate for the whole of the year, the augmentation of revenue during the present year may have further beneficial results. Units sold, 926,918; maximum load, 500 kW.; load factor, 21'16 per cent.

TRAMWAY AND RAILWAY NOTES.

Argentina.—According to a Buenos Aires telegram, the tramway employés at Rosario have gone on strike. Many of the tramcars have been set on fire.

Blackburn.—**WAGES.**—The Corporation Tramways Committee, last week, considered an application from the Lancashire and Cheshire District Council of the Amalgamated Association of Tramway Workers for an additional increase in wages of 7s. 6d. a week for all tramway workers (male and female) over 18 years of age, and 3s. 3d. per week for all under that age. It was decided to allow the matter to go to arbitration.

Bradford.—**TRAMCAR LIGHTING.**—In view of the proposed improved street lighting during the coming winter, efforts are being made to obtain better tramcar lighting also. The matter has been taken before the authorities concerned, but has not yet been settled.

Continental.—**SPAIN.**—The constructional works have been started of the electric railway from Santa Coloma de Farnés to Sils, which the company of the same name has in hand. The line is important as being the first stage in a network 245 km. in extent, which is destined to cover a great part of the province of Catalana. The network will cross the provinces of Barcelona and Gerona from Manoesa, on the shores of the Levant, to Maya, Vich, San Hilario, Santa Coloma, Sils, and Llagostera, with branches to the most important population centres of these territories, which will be linked together by three main and two secondary railway services. The network will open up the rich forest and mineral regions of Las Guilleras, and bring life and movement to communities, many of which are now shut out from outside communication.—*Industria e Invenções.*

Application has been made for a concession for the construction and working of an electric tramway in Guadálajara between the railway station and the centre of the town.

GERMANY.—It is reported from Krefeld that the German War Office has decided to stop the tramway service and place the tramway material at the disposal of the army. Similar measures are contemplated in other industrial centres in Western Germany.

Droylsden.—**FARES.**—At a meeting of the D.C. held last week, a protest was raised against the increased fares between Droylsden and Ashton-under-Lyne on the Manchester to Ashton system. From Droylsden to Ashton the fare is 2½d., and from Droylsden to Manchester, nearly three times the distance, it is only 1½d.

Farnworth.—**THROUGH RUNNING.**—A working arrangement has been arrived at between the Bolton Corporation and the South Lancashire Tramways Co. whereby cars now run through from the Black Horse, Farnworth, to the terminus at Bolton, only one ticket instead of two being issued.

Liverpool.—**Southport Railway.**—**STOPPAGE.**—A breakdown on the Liverpool-Southport Electric Railway line on Friday morning, last week, caused considerable delay to business men and visitors. As one of the electric trains was travelling between Seaförth and Liverpool something went wrong with the motors, and the train stopped, blocking the line. Eventually a steam locomotive was requisitioned, but the service was interrupted for the better part of an hour.

London.—**COLLISION.**—A collision occurred between two L.C.C. tramcars, on Sunday evening last, and resulted in 12 persons being injured. A tramcar standing at the junction of New North Road and Essex Road was run into by one coming from the north, owing to the failure of the brakes to act, the front of the runaway car being completely smashed; the injured were treated at the local hospitals, but none were detained except the driver of the runaway car, who was rather severely injured.

Rawtenstall.—**STRIKE SETTLED.**—The trouble on the Corporation tramways, which resulted in a five-days' strike on the part of the employés, has been settled. The dispute arose because the male workers were offered a war bonus of 4s. a week and the females one of 2s. 6d., to date from September 1st, and the employés wanted a 4s. bonus all round, to date from July 1st. The Town Council has now agreed to the all-round bonus of 4s., but it is to date from September 1st, and the employés have accepted the offer.

South Africa.—**BLOEMFONTEIN.**—In connection with the railless tramway service the Town Council has decided to employ tractors in order to cope with the traffic on certain routes. As an experiment, an order for one tractor has been placed with the Griffin Engineering Co., of Johannesburg.

Wallasey.—**STRIKE.**—The Corporation tramway drivers and conductors came out on strike on Wednesday last, after giving 48 hours' notice of their intention, failing an undertaking from the Tramways Committee to cease training women as drivers. The employees' contention that the object of training women as drivers was to displace men and to release more men for the Army, was met by the assurance of Colonel R. R. Greene, the general manager, that women employed as drivers would receive the same wages as men. Although it was further pointed out that such a strike was illegal, both men and women came out. A curtailed service was run with the help of the office staff, 15 cars being out against the usual 45, and considerable inconvenience was caused to business people. On Thursday, however, the strike collapsed, the employees returning to work on the understanding that their grievances would be considered by the Committee.

TELEGRAPH AND TELEPHONE NOTES.

Argentina.—The Government has withdrawn the permission granted to a German wireless telegraph company to make experiments with a view to recording the wireless communications sent out from Nauén, the big wireless telegraph station near Berlin.

The New York *World* publishes a dispatch from Buenos Ayres revealing the existence of a vast German spy system in Argentina, and disclosing the bureau which directed all espionage in South America. A secret wireless apparatus was discovered, and messages concerning ships were traced. The Argentine Government has proof that Germans collected facts relative to the departure of cargoes and the destination of vessels, the place of embarkation of troops, and the movements of neutral ships. The dispatch says that German spies in Argentina were in direct communication with Berlin—by cable to Madrid, and thence by wireless to Berlin.—*The Times*.

South Africa.—Owing to the approaching exhaustion of stocks and the impossibility of obtaining supplies, the Postmaster-General announces that the extension of the telephone service must be restricted to the minimum until the stock of materials can be replenished.

CONTRACTS OPEN AND CLOSED.

OPEN.

Australia.—**MELBOURNE.**—October 10th. Department of the Navy. Pumping plant and equipment for the Commonwealth Naval Dockyard, Cockatoo Island, Sydney. Specifications from the Director of Navy Contracts, Melbourne.

Kirkcaldy.—October 2nd. Corporation. Converting plant and switchgear. See "Official Notices" September 14th.

Liverpool.—September 24th. Electrical supplies for three months, for Toxteth Park B. of G. Mr. R. A. James, Clerk. 15, High Park Street.

London.—**KENSINGTON.**—September 27th. B. of G. Six months' supply of electric fittings and lamps. Mr. W. R. Stephens, Clerk to the Board, Guardians' Offices, Marloes Road, W. 8.

Manchester.—September 25th. Corporation Tramways. Pitch. Mr. J. M. McElroy, General Manager.

September 27th. Lancashire and Yorkshire Railway. Various stores, including (39) signal and telegraph wires. Mr. Waring, Stores Department, Osborne Street, Manchester.

Merthyr Tydfil.—September 24th. B. of G. Electrical accessories for six months. Mr. F. T. James, Clerk. 134, High Street.

CLOSED.

Glasgow.—The Electricity Committee reported to the T.C. that it had considered the tenders received for the reinforced concrete superstructure for one boiler house, turbine room, and workshop at the new generating station, Dalmarnock, and recommended acceptance of the offer of Messrs. Train and Taylor, at £64,539, it being the lowest.

The engineer reported on the tenders received for (1) boiler-house plant and (2) E.H.T. switchgear for the new generating station at Dalmarnock, and the Sub-committee, after consideration, agreed to recommend acceptance of (a) an offer by Messrs. Babcock and Wilcox, Ltd., for eight boilers, stokers with forced and induced draught, economisers, chimneys, feed pumps,

and piping, for £140,282; and (b) an offer by Messrs. A. Reyrolle and Co., Ltd., to supply and erect 12 sets of E.H.T. switchgear for the power-house there, for £33,985. At a subsequent meeting it was reported that there had been considered a letter from Messrs. Babcock & Wilcox, Ltd., stating that the cost of labour and material in connection with their contract for providing and erecting a coal conveyor and transporter at the new works at Dalmarnock had increased by at least £5,700, and asking that they should be allowed an additional sum of £5,000 on their contract price of £21,000. Having heard the engineer, the Committee was of opinion that the increased price asked for was reasonable in the circumstances, and agreed to recommend that the same be granted.

The engineer reported that additional switchgear would be required at the various sub-stations, and the Sub-committee authorised him to order from Messrs. A. Reyrolle & Co., Ltd., 27 panels, at £14,210.

Government Contracts.—List of new contracts placed during August, 1917:—

WAR OFFICE.

Dry batteries.—Houghton-Butcher Manufacturing Co., Ltd.
Battery boxes.—T. & J. Hughes; F. Restall, Ltd.
Insulator brackets.—Bullers, Ltd.; Butterworth & Dickinson, Ltd.; Douglass Bros., Ltd.; G. Wilson & Co., Ltd.
Electric cable and wire.—B.I. & Helsby Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; W. T. Glover & Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Hooper's Telegraph & India-Rubber Works, Ltd.
Dynamoes.—General Electric Co., Ltd.
Ebonite rod.—St. Helens Cable & Rubber Co.; Siemens Bros. & Co., Ltd.
X-ray equipment.—Cavendish Electrical Co., Ltd.
Electric light fittings and accessories.—Elm Works, Ltd.; Evesson Bros., Ltd.; E. Stevens, Ltd.; J. Stevens, Ltd.
Electric lamps.—British Thomson-Houston Co., Ltd.
Electric motors.—Electric Construction Co., Ltd.
Electrical plant.—Harland Engineering Co.
Iron and steel wire.—R. Johnson & Nephew, Ltd.; Shropshire Iron Co., Ltd.
Switches.—General Electric Co., Ltd.

INDIA OFFICE STORE DEPARTMENT.

Copper plates.—Williams, Foster & Co.; Pascoe, Grenfell & Sons.
Copper wire.—T. Locker & Co.
Wire.—R. Johnson & Nephew, Ltd.; Whitecross Co.; B.I. & Helsby Cables, Ltd.

POST OFFICE.

Telegraph apparatus.—British L. M. Ericsson Mfg. Co., Ltd.; Siemens Bros. & Co., Ltd.
Telephone apparatus.—Automatic Telephone Mfg. Co., Ltd.; B.I. and Helsby Cables, Ltd.; British L. M. Ericsson Mfg. Co., Ltd.; Peel-Comer Telephone Works, Ltd.; Siemens Bros. & Co., Ltd.; Thornton-Pickard Mfg. Co., Ltd.; Waltham Cross Jeinery Co.
Submarine cables.—Siemens Bros. & Co., Ltd.; Telegraph Construction and Maintenance Co., Ltd.
Telegraph cables.—B.I. & Helsby Cables, Ltd.; Hackbridge Cable Co., Ltd.; I.R., G.P. & Telegraph Works Co., Ltd.; Telegraph Construction and Maintenance Co., Ltd.
Telephone cables.—B.I. & Helsby Cables, Ltd.; Johnson & Phillips; New Gutta-Percha Co., Ltd.; Telegraph Construction & Maintenance Co., Ltd.; Union Cable Co., Ltd.; Western Electric Co., Ltd.
Dry cells.—British Ever-Ready Co., Ltd.
Plates for stay-rods.—Walker Bros., Ltd.
Insulator rings.—C. Macintosh & Co., Ltd.
Pole steps.—Gnest, Keen & Nettlefolds, Ltd.
Stay swivels.—Bullers, Ltd.
Bronze wire.—T. Bolton & Sons, Ltd.; Shropshire Iron Co., Ltd.; F. Smith and Co. (incorporated in the London Electric Wire Co. & Smiths, Ltd.).
Copper wire.—T. Bolton & Sons, Ltd.; Elliott's Metal Co., Ltd.; Johnson and Nephew, Ltd.; F. Smith & Co. (incorporated in the London Electric Wire Co. & Smiths, Ltd.); Wilkes, Son & Mapplebeck, Ltd.
Enamelled and flameproof wire.—Fuller's Wire & Cable Co., Ltd.
Galvanised-iron strand wire.—Rylands Bros., Ltd.; Whitecross Co., Ltd.
Steel wire.—Rylands Bros., Ltd.
Switchboard wire.—B.I. & Helsby Cables, Ltd.

London.—**ST. PANCRAS.**—B.C. New air-pump for the converted 1,500-KW. Ljungstrom turbine at the King's Road station. £300: Brush Electrical Engineering Co., Ltd.

POPULAR.—Electricity Committee. Recommended:—

Overhead crane for High Street sub-station.—Herbert Morris, Ltd., £447.
Steam piping.—Aiton & Co., £224.

Southend-on-Sea.—T.C. Electricity Department:—

Callender's Cable & Construction Co., Ltd.—100 service boxes, 11s. 6d. each.
Belliss & Morcom, Ltd.—Piston and piston rings, £20 14s.

FORTHCOMING EVENTS.

Association of Supervising Electricians.—Tuesday, September 25th. At 7.15 p.m. At St. Bride's Institute, Bride Lane, E.C. Presidential address by Mr. J. S. Highfield.

NOTES.

Foreign Trade.—**THE AUGUST FIGURES.**—The official returns of imports and exports during last month contain the following electrical and machinery figures:—

	August, 1917.	Inc. or dec.	8 months, 1917	Inc. or dec.
IMPORTS.				
Electrical goods ...	97,318	— 12,137	— 151,919	
Machinery ...	817,910	+ 199,475	— 278,158	
EXPORTS.				
Electrical goods ...	257,172	— 152,337	— 645,600	
Machinery ...	1,644,351	— 289,359	+ 717,211	

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—
Officer for the Week.—Second Lieut. C. E. Campbell.

Monday, September 24th.—Technical instruction (searchlight) for No. 3 Company, Right Half Company, at Regency Street. Drill, No. 3 Company, Left Half Company. Signalling Class, 6.30. Recruits' Drill, 6.30.

Tuesday, September 25th.—Physical drill and bayonet fighting.
Wednesday, September 26th.—Drill and elementary bridge construction for No. 1 Company, Right Half Company.

Thursday, September 27th.—Drill and elementary bridge construction for No. 2 Company, Right Half Company. Signalling Class, 6.30. Ambulance Class, 6.30.

Friday, September 28th.—Technical instruction (searchlight) for No. 3 Company, Left Half Company, at Regency Street. Drill, No. 3 Company, Right Half Company. Recruits' Drill, 6.30.

Saturday, September 29th.—Commandant's Parade for route march and drill. Parade at Headquarters, 2.45 p.m. Uniform. Recruits' drill, 2.30.

(By order) MACLEOD YEARLEY, Capt. and Adjutant.

Nitrolim.—In a recent lecture on the manufacture of cyanamide and kalkstickstoff (nitrolim), delivered in May last at Vienna, M. Doleh had remarked that the Swedish process of making the cyanamide in vertical shaft furnaces was not profitable, because the electrode consumption was high, and the nitrogen percentage of the final product rather low. Mr. P. Carlsson, of the Aktiebolaget Nitrogenium, Ljungaverk, replies to this remark in a recent number of the *Chemiker Zeitung*, refuting the statement and giving some interesting particulars. The carbon electrodes, he says, are Plania or Högans electrodes, 350 mm. in diameter, which is not at all an exceptional size. There is no loss of pieces of the electrodes, which are constantly being lengthened. The electrode consumption is 3.75 kg. per ton of kalkstickstoff, which is supplied in a porous ground mass containing 19 per cent. or 20 per cent. of nitrogen. The product is said to be very uniform just because the carbide gradually descends in the shaft furnace: 725 kg. of carbide yield one ton of kalkstickstoff. The furnace process is continuous, and it does not take so long as with other furnaces to start operations again after some breakdown in the power house. In short, the process is described as both reliable and economical.—*Engineering*.

Tar Oil as Fuel for Diesel Engines.—In view of the recent Orders made by the Ministry of Munitions regulating the use of creosote and other oils produced from the distillation of coal, the DIESEL ENGINE USERS' ASSOCIATION has taken action to assist as far as possible in making arrangements for the necessary supplies of tar oils for its members. The present difficulty of obtaining a sufficient supply of petroleum residual oil as fuel for Diesel engines has led a large number of users to adopt tar oil.

At the present time, "Creosote Licences" are only being granted for a period of two months, but the Association is hopeful that its members may shortly be able to obtain licences for the use of tar oil for longer periods, so as to facilitate arrangements in making contracts for regular supplies. The honorary secretary of the Association has collected particulars of the requirements of the various members who use, or who contemplate using, tar oil, and these, together with other information, have been submitted to the Director of Munitions Petroleum Supplies.

Cast Iron as a Bearing Metal.—When one considers the suitability of cast iron as a bearing material, it is a matter for wonder why it is not more generally used. Designers are so used to the usual run of bearing material that they appear unable to accept the evidence of their own eyes. Let any engineer look round his plant, and he will find plenty of evidence of the successful use of cast-iron. Personally, the writer is prepared to use cast-iron in practically every case where the copper alloys are at present used. In his present shop are dozens of shafts running in cast-iron bushes up to 3 in. in diameter, and up to 1,000 R.P.M., and they give very little trouble—certainly no more than brass. Strange to say, most of these are on American and Continental machines. When the comparative costs of the copper alloys and cast-iron are taken into consideration, it will be seen that considerable economy can be effected by the use of the latter in preference to the former, with no reduction in efficiency. This fact will have to be taken into account at no distant date, and it behoves British designers to give the matter serious consideration. One little hint may be of use. When using cast-iron as a bearing material, provision should be made for renewable bushes, as is usual when brass is used. Most makers, when using cast-iron, simply bore holes in the castings composing the machine. When it is required to re-bush the holes, considerable trouble and expense are incurred by having to re-bore them to admit bushes. G. B., in the *Mechanical World*.

The Engineering Council of the United Engineering Societies, U.S.A. On June 27th was held the first meeting of the Engineering Council. This body is a department of the United Engineering Society, and has recently come into being as a medium of co-operation among the four national engineering societies. The function of the Council may, perhaps, best be described by the following extract from the by-laws of the United Engineering Society: "The Council may speak authoritatively for all member societies on all public questions of a common interest or concern to engineers." The Council is composed of 24 members, five being appointed by each of the four founder societies and four by the United Engineering Society. At the organisation meeting the following officers were elected: President, I. N. Hollis; vice-presidents, H. W. Buck, George F. Swain; secretary, Calvert Townley; Executive Committee, the four officers named, with J. Parke Channing and D. S. Jacobus.

The Council discussed at length ways and means by which the founder societies, through the Council, might be of use to the nation. The unanimous desire to help the Government in the prosecution of the war resulted in a resolution instructing the Executive Committee to co-operate with the Government in procuring the services of engineers, also the appointment of a Committee of three to consider the best means of utilising the inventive ability of members.

The secretary was instructed to inform all Government bureaux that might be interested in the organisation of the Engineering Council and its desire to be of assistance.—*American Machinist*.

A New Permanent-Magnet Steel.—A new steel of considerable importance has been made in the United States for the last year or so, directly the outcome of war conditions. It is a new permanent-magnet steel, a substitute for the older steel, known as tungsten magnet steel, which was used exclusively for this purpose before the war.

The new steel, which is reported to be not less than 90 per cent. as efficient as the old permanent-magnet steel, is a 0.90 per cent. carbon steel containing about 2 per cent. of chromium, and is now being made in electric furnaces in the U.S.A. and extensively used by many consumers.

This new type of steel is based on investigations made by Dr. John A. Mathews, of Syracuse, N.Y., and published by the American Society for Testing Materials about three years ago, in which it was pointed out for the first time that certain types of steel were better magnetically when quenched in oil than when quenched in water. This statement was entirely contrary to all previous ideas regarding the hardening of steel for permanent magnets.

Magnetically this new chromium steel is equal to tungsten magnet steel in permanence, but somewhat lower in residual density. Users have found it possible to substitute this steel for the older steel, without making any change whatever in their windings or in the cross sections of the magnets used.

Practically chrome magnet steel, as the new steel is called, is not as good as the tungsten magnet steel, because it requires oil hardening, which is not as convenient as water hardening, and also because chrome steel in its natural state is much harder to drill or machine, and the steel itself must be handled with greater care and uniformity in heat treatment than is necessary with tungsten steel.—*Scientific American*.

Revamping the Central Station.—The change in generating practice brought about by the introduction of the steam turbine some 15 years ago has been very startling in its results, and particularly so in the case of big city plants, in which economy of space may become nearly or quite as important as economy of coal. A very excellent example of what has happened will be found in the remodelling of the St. Louis generating station, which in its first stage of existence some 14 years ago happened to be one of the last big plants with reciprocating engines. The great cross-compound reciprocating engines of the original plant had scarcely more than settled down to their bearings before it was necessary to increase the station capacity, and four 5,000-kw. turbine generators were added. The original boiler plant consisted of 28 Scotch boilers. To take care of the new units 40 water-tube boilers were added on an upper deck. Three years later more output was required, and the four turbines were replaced, after only three years' service, by 12,000-kw. turbines. Again more steam was needed, and 12 of the Scotch boilers were replaced by water-tube boilers. So far as the turbine plant was concerned, it now had 52 boiler units to provide steam for 48,000 kw., as against 40 boilers for the 20,000 kw. The generating equipment remained in this stage of evolution for seven years, and then there was another forward movement. This time one of the original 3,000-kw. reciprocating engine sets was removed, and in its place was installed a 20,000-kw. horizontal turbine. For this unit the remaining 16 Scotch boilers came out and 10 water-tube boilers went in, with 2,000-kw. capacity per boiler. With the greatly increased output two of the reciprocating sets were removed and their room was utilised for the extension of the switchboard space. Finally, plans are now under way for abolishing the remaining two old units and putting two 20,000-kw. turbines in their place. One rarely sees a more striking example of the very radical changes in practice wrought by a few years' development. It would not be unsafe to prophesy that when the two new units go into place they will not require 10 boilers apiece.—*Electrical World*.

The Decimal System.—Recently a "questionnaire" was circulated among the members of the Chartered Institute of Secretaries for the purpose of obtaining opinions in regard to the adoption of a decimal system of coinage in the United Kingdom and the substitution of the metric system for the existing United Kingdom weights and measures. Of the replies received, 85 per cent. considered that a change to a decimal system of coinage would be favourable to the business in which they were engaged, and 66 per cent. favoured a £ basis of coinage in preference to the "Imperial Crown" or dollar basis.

With regard to weights and measures, 86 per cent. favoured a change to the metric system, 53 per cent. of whom already used that system in their businesses. The large majority were of opinion that the metric system not only facilitated their internal office work, but had led to extended business relations with other countries, including France, the United States, Russia, and the Argentine. In 61 per cent. of the replies the business of the company was stated to be hindered by the use of the existing system of weights and measures.—*Financier*.

Training Apprentices for the Electrical Trades.—The need for technical instruction of a specialised nature for apprentices in the electrical trades has long been felt, and it will be remembered that some time ago Mr. R. W. Paul in particular endeavoured to bring about a reform in this respect, with especial reference to the requirements of electrical instrument makers. The teaching institutions, we believe, held that their ordinary classes adequately met the case, but manufacturers considered that these courses were of too general a character, and Mr. Paul organised a special instruction department in his own works to provide the training which he thought necessary. The whole subject will be dealt with, no doubt, by the Ministry of Education in connection with its new schemes, but in the meantime we are glad to learn that the Northampton Polytechnic Institute has led the way by inaugurating day and evening courses for apprentices and others in the electrical trades, which will open shortly.

It is recognised that evening instruction alone is unsuitable for boys from 14 to 17 years of age: in the announcement issued by the Principal, Dr. R. M. Walmsley, it is urged that at least a part of the training should be given in the daytime, not less than one whole afternoon a week being devoted to technical instruction. In addition, the general education of the boys leaving the elementary schools should be continued, and for this purpose evening classes will be held at the Junior Technical Institutes of the L.C.C., affiliated to the Northampton Institute, on two nights a week in English, calculations, general subjects, and gymnastics, the work of the elementary schools being thus continued, with a technical bias directed towards the industry in which the boys are engaged. In future sessions, as the scheme develops, the courses will be elaborated. Provision is made in the day courses at the Northampton Polytechnic Institute for three grades of apprentices, and the evening classes there, as well as at the Junior Technical Institutes, will be co-ordinated with the day work. The courses can only be held if a sufficient number of enrolments is received by Friday, September 28th, and it is to be hoped that employers will take immediate action to induce their apprentices to apply for admission.

Messrs. Marryat & Place, who for some years have been deeply interested in this question, and are entirely satisfied with the proposals of the Institute, are sending some 20 students, and are anxious to have the support of other members of the trade. The importance of the matter in these days can hardly be exaggerated, and we hope that the opportunity to assist in this movement will be seized by the electrical manufacturers in the London area.

Fatality.—A verdict of "Accidental death" was returned at an inquest held at Derby to inquire into the death of Harold Canham, 24, who was killed while following his employment as an engineer at Messrs. Newton Bros.' Electrical Works. According to the *Nottingham Guardian*, the deceased was connecting a motor to the supply for testing purposes, and was holding a copper bar with one hand and the framework of the switchboard with the other, when apparently he slipped, and one of his hands came in contact with a live wire, and he was held until the current was cut off by an apprentice; he then dropped. Attempts at resuscitation proved unavailing.

The test-bed foreman, John Husbands, said it was the rule that the current should be cut off before such an operation was commenced, and he thought that deceased must have turned it on unthinkingly. The voltage was 400.

Metropolitan Power Station Engineers.—A meeting was held at St. Bride's Institute, on September 14th, of the London A.E.S.E. Committee and other representatives of the engineering staffs of London electricity supply stations. The Press report of the conference between the Electrical Trades Union and the Associated Municipal Electrical Engineers, under the auspices of Sir G. R. Askwith, dealing with the rates of pay, &c., of charge engineers, was discussed. It was decided that the secretaries of kindred Associations should be approached, with a view to a joint protest being made to Mr. G. R. Askwith to the effect that the E.T.U. does not represent the central station engineers of the London area, and that a joint conference should be held at St. Bride's Institute on September 25th, at 7 p.m., to decide the action to be taken in the matter.

South African Municipal Electrical Engineers in Conference.—The second annual Conference of the Association of Municipal Electrical Engineers (Union of South Africa), which was founded in 1915, was to take place at Durban from August 27th to September 1st. We have received an advance copy of the programme, but, under the prevailing conditions, the report of the proceedings will probably not come to hand for a while.

Owing to the war and depleted staffs many of the Association's 31 members were unable to attend, and one at least was on Active Service. It was, however, anticipated that some 16 engineer members and about 8 Councillor delegates would attend. The Natal Society for the Advancement of Science and Art (Engineering Section) was also taking part, and a useful and instructive week was anticipated. One of the most important subjects to be considered was that of "Standardisation," in connection with which a Standards Committee has been meeting regularly at Johannesburg, consisting of representatives of the following bodies:—S.A. Institute of Electrical Engineers, S.A. Institute of Engineers, Association of Municipal Electrical Engineers (S.A.), Engineering Section Natal Society for the Advancement of Science and Art, British Electrical and Allied Manufacturers' Association, Institution of Electrical Engineers (England), and Government Departments, Union of S.A.

It was anticipated that some important representations and proposals would be forthcoming from the Convention regarding electrical standardisation as affecting municipalities.

The opening meeting was to take place at the Town Hall, Durban, on Monday, August 27th. The official welcome by the Mayor was to be followed by the annual general meeting for the receipt of reports, election of president, secretary, and other officers. After the official luncheon a visit was to be paid to Messrs. Lever Bros.' Soap Works. On Tuesday the presidential address was to be delivered by Prof. J. H. Dobson, and a discussion on "Tariffs," led by Mr. John Roberts, was to follow. Other events of the day included a visit to the Harbour Works and cooling plant, and, in the evening, a paper on "South African Municipal Electrical Undertakings," by Mr. Poole, assistant electrical engineer, Durban. On Wednesday the party was to meet at Pietermaritzburg, and the events included a visit to the municipal power station there, an official luncheon by the Mayor, and a paper on "Gas Plants," by Mr. F. Castle, municipal electrical engineer, Oudtshoorn. Thursday, back at Durban, a paper by Mr. J. Roberts, on "Standardisation," was down for discussion, followed by a visit to the municipal power station and dinner at the Royal Hotel. On Friday, Mr. J. Hamlin, municipal electrical engineer, of Stellenbosch, was to introduce "The Design and Management of Small Power Installations," followed by an afternoon visit to the Explosives Works of the Sugar Factory. Saturday, September 1st, was left free for any business meetings or adjourned discussions that might be arranged.

Board of Trade Urges British Manufacturers to Combine.—At a meeting of the Birmingham Brass Masters' Association, held on Monday, important addresses were delivered by Mr. L. A. Paish, of the Commercial Intelligence Department of the Board of Trade, and Mr. C. Hamilton Wickes, H.M. Trade Commissioner for Canada. Mr. Paish said that the Board of Trade had closely followed the syndicating efforts of German industry, and they were convinced that it was absolutely essential for British manufacturers to get together into some sort of trading combination if they were to regain lost trade and to increase their export trade after the war. Combination would have to meet combination. The speaker went on to show that Birmingham brass masters could in combination systematically investigate a market, whereas an individual firm would be unable to do so. By means of an Association of the whole of the products of the brass industry, a man could be put into any market thoroughly to study the changes that had taken place during the war. The Board of Trade Commercial Intelligence Department was prepared to co-operate in every possible way to that end, even, says the *Times* report, to the extent of financial assistance in the sending out of such a representative. The Department was out to give manufacturers and traders all the assistance they could reasonably expect. He was instructed to take steps to get the formation of a trading Association for the brass industries actually going; if they did not combine, they would go under. Mr. Hamilton Wickes, who followed, said that what German manufacturers had done in the past in certain lines would be done by the German nation—namely, it would purchase as one body the raw material required from outside countries for its vital industries. Was it not time that British manufacturers got together?

American Lumbermen for France.—The regiment of Lumbermen, for service with the United States Army in France, has been recruited to full strength. The "lumber-jack regiment," as this is known, is for service in the woods of France, getting out material for the use of the Army. The enlistments were secured through the Forest Service, and the men comprise practical lumbermen and foresters. For this work the regiment will go thoroughly equipped with portable and stationary electrically-driven sawmills, lighting outfits and transportation facilities. *Electrical Review*, U.S.A.

The A.S.E.—The Amalgamated Society of Engineers reports that at June, 1917, its general fund and superannuation reserve fund stood at £1,952,786, an increase of £210,999 for the quarter. £730,000 of the total is due to the superannuation reserve fund.

Educational Notice.—CITY OF LONDON COLLEGE, MOORFIELDS.—The new session for Business and Commercial courses commences on October 1st. Prospectuses can be obtained from the Secretary.

The Electrodeposition of Zinc.—"Borodising" is the name given by the Deptford Steel and Iron Works, Ltd., to a system of electrodeposition of zinc which they have introduced as a preventive against corrosion of the steel fittings of aeroplanes and seaplanes. It is described as a method of cold electrogalvanising carried out in such a way that the zinc so unites with the underlying metal that only by extreme wear can the surface of the steel be exposed. As the metal is not subjected to the usual pickling bath prior to the galvanising, it is claimed that there is no reduction in the strength of the metal after treatment. We understand that the process has been approved by the Air Department, the Admiralty, and the War Office, and that the company has installed a large plant to deal primarily with all steel fittings employed in the manufacture of aircraft.

Engineering Congress.—The *Globe* gives further particulars of the "First General Congress of Civil Engineering," which is to be held for the study and inauguration of "After-the-War Programmes." The first seven sections are styled "technical"; three other sections have now been constituted to deal with economics. The Congress will discuss methods of reorganising French industries on the most modern lines, and the various sections and sub-sections have already made substantial progress in preparing their agendas.

Legal.—At Nuneaton, Wm. Docking (18), miner, was charged with stealing 11s., the moneys of the Nuneaton Corporation. The town clerk stated that for some time past the electric lighting slot meters had been tampered with and money extracted. Prisoner had procured a key and gone about emptying slot meters. There were 18 cases altogether against him, but he only proposed to go into three, the amounts involved being £1 15s., for which defendant's solicitor had sent a cheque. Mr. Clay said prisoner's parents had offered to refund the whole of the money, £8 4s. Prisoner was sent to prison for three months.

LIABILITY FOR SAMPLES.—In the City of London Court, on September 18th, before his Honour Judge Rentoul, K.C., an action was brought by William Whitehouse & Co., Ltd., Empire Works, Brulton Street, Birmingham, electric light and gas fitting manufacturers, against Messrs. Lyall Willis & Co., electric light and gas fittings merchants, Billiter House, Billiter Street, E.C., to recover the sum of £34 19s. 9d., as damages for breach of contract, dated July 17th, in which the defendants agreed to return certain electric light and gas fittings at the expiration of the agreement. Mr. Goodman, plaintiffs' counsel, said alternatively the claim was for the return of the goods wrongfully detained, or £39 19s. 9d. their value. Defendant said he had done everything in his power to hasten the return of the samples from India. The non-return was largely due to restrictions and shipping conditions imposed by the Board of Trade. Judge Rentoul thought it was quite reasonable of plaintiffs to ask that they should be paid the value of the samples, and, of course, costs, and plaintiffs would return the money if the goods came to hand within a certain time—say, six months. Mr. Goodman said the plaintiffs were willing to agree to these terms, subject to the goods being returned before March 1st. Judge Rentoul said he would give judgment for the plaintiffs for the amount claimed, with costs, and they would refund the money if the defendant returned the goods before March.

CAFE TOWN.—The manager of the Southern Cross Cold Storage Co. was recently charged with abstracting 30 units of electrical energy from the installation in premises occupied by Chiat & Co. Mr. J. Power, installation superintendent for the City Corporation, deposed that two circuits, which supplied light to the premises occupied by the Southern Cross Co., had been connected to Chiat's meter without the authority of the Corporation. Charles Zion, manager for Chiat & Co., stated that no permission had been given to the Southern Cross Co. to make the connection. The Magistrate, however, came to the conclusion that the accused had not acted with any criminal intent, and discharged him.

A DUNDALK CONSUMER PROSECUTED.—The Dundalk magistrates sent for trial at Quarter Sessions, Dominica Mezza, prosecuted by the local Urban Council, for alleged fraudulent consumption of electricity. Mr. P. A. Spalding, the Council's electrical engineer, stated that one of the seals on Mezza's meter came off the sealing wire easily, and the other had disappeared. The jointer removed one of the wires, and when the lights were switched on every lamp in the place lit up, which showed that the current went direct to the lamps without going near the meter. He estimated the value of the electricity abstracted at £2 at least. The jointer, Frank Wilson, said he did not think it possible that a Council official could have diverted the current while regulating the meter.

Institution and Lecture Notes.—Electrical Association of Australia (N.S.W. Section).—At the monthly meeting held in Sydney, on June 8th, an illustrated lecture was delivered by Mr. Russell Sinclair, dealing with munition work and developments in England.—*Commonwealth Engineer.*

South Australian Institute of Engineers.—At the annual meeting, some notes were given by a member on the Bille-Creed automatic telegraph system.—*Commonwealth Engineer.*

Association of Supervising Electricians. The first meeting of the new session is to be held on Tuesday next, September 25th, at 7.15 p.m., at the St. Bride's Institute, E.C. The President, Mr. J. S. Highfield, will deliver his inaugural address. Other arrangements for the session are as follow (all meetings are on Tuesdays):—

October 30th.—"Switchboard Telephone Equipments," by Mr. T. F. Lee.
December 4th.—"Transformers" (author to be appointed by Westinghouse Co.).
January 15th, 1918.—Half-yearly meeting and informal discussions.
February 19th.—"Cable-laying," by Mr. E. S. Byng.
March 26th.—Paper by Mr. F. H. Taylor.
April 30th.—"A.C. Motors," by Mr. E. F. Butler.
June 25th.—Annual meeting.

S.A. Institution of Engineers.—At the adjourned annual general meeting of the Institution, on July 14th, Mr. Bernard Price, President, announced that Mr. G. M. Clark had been elected President for the 1917-18 session, and installed him in the chair.

Canal Transport.—The reorganisation of the English canals under the Canal Control Committee has now attained a stage at which the Committee is able to invite traders to send their goods by canal instead of by rail, in order to relieve the traffic on the railways.

Appointments Vacant.—Charge engineer for the Walsall Corporation Electric Supply Department; meter and mains assistant (50s.), for the Loughborough Corporation electricity department. For particulars see our advertisement pages to-day.

Old Lamp Tops.—A correspondent inquires as to the best method of recovering platinum from old electric lamp tops, and also how to test the metal and distinguish it from substitutes.

Wages Increase at Melbourne.—"Threatening to strike and thus paralyse city industries, and practically envelop the city in darkness if the demands were not acceded to, the employees of the Melbourne City Council undertaking have been granted increased wages. The rates agreed upon and those paid by the Melbourne Electric Supply Co. are as follows:—Engine drivers, 13s. 6d., increase 10d. (M.E.S. 13s.); assistant engine drivers, 12s. 6d., increase 10d. (M.E.S. 11s.); leading firemen, 12s. 6d., increase 4d. (M.E.S. 12s. 6d.); firemen, 11s. 6d., increase 10d. (M.E.S. 11s.); trimmers, 10s. 6d., increase 10d. (M.E.S. 10s.); coal conveyor attendants, 11s., increase 10d.; switchboard attendants, increase 1s. 4d.; sub-station attendants, 12s. 6d., increase 1s. 4d.; dynamo attendants, 10s. 6d., increase 10d."—*Commonwealth Engineer.*

British Ignition Apparatus Association.—The address of Mr. Ernest Garton, honorary secretary of this Association, is now 9, Northumberland Road, Leamington Spa, where all letters and communications in connection with the Association should be sent.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—A commission in the Royal Engineers has been granted to Mr. HERBERT PURSEY, who held a position as an electrical engineer at Calcutta, and left India to volunteer for active service.

In a reply to criticisms at a meeting of the Dublin Corporation, Mr. MARK RUDDE, city electrical engineer, informed the Electricity Supply Committee that he was not a member of any Lodge—Masonic, Orange, Hibernian, or Sinn Fein—and denied that he had ever been threatened by any member of his staff.

Exeter City Council, at Tuesday's meeting, approved of the electrical engineer, Mr. MUNRO, acting as the local representative of the Coal Controller, subject to the work not interfering with the performance of his ordinary duties. The engineer's task will include visits to the principal local authorities in Devon and Cornwall, and is honorary. The Controller desires to promote the use of electricity, gas, and coke from local supplies in place of coal, wherever possible, and to facilitate the interconnection of electrical stations.

General.—It is stated in the newspaper Press that Sir A. STEEL-MAITLAND, the present Under-Secretary at the Colonial Office, has been offered, and has accepted, the position of Chief of the new Commercial Intelligence Service of the Foreign Office and the Board of Trade.

Communications for Mr. J. WILKINSON, tramway electrical engineer, Hull, should in future be addressed:—Tramway Power Station Buildings, Osborne Street, Hull.

Mr. JAMES LIVINGSTON, for the past five years assistant postmaster at Leeds, retires at the end of September, after 47 years' service. He commenced in Glasgow in 1870, being transferred to Leeds in 1906, as chief inspector of telegraphs, and five years ago became assistant postmaster. He entered the service about the time of the nationalisation of the telegraph, and took part in the work of co-ordination following on the change from the widely differing methods of the companies taken over. In Glasgow he was a lecturer in the electrical engineering department of the West of Scotland Technical College.

The *Daily Telegraph* states that Sir ARTHUR WHITELEGGE, K.C.B., who has held the appointment of His Majesty's Chief Inspector of Factories and Workshops at the Home Office for more than 21 years, will retire in the course of next month on reaching the age limit of 65, and the Home Secretary has appointed Mr. H. M. ROBINSON, the senior Deputy Chief Inspector, to succeed him. Sir Arthur will continue to give his services to the Factory Department in an advisory capacity on questions of a technical and scientific character. Mr. R. E. GRAVES, the junior Deputy Chief Inspector, will now become senior Deputy Chief Inspector, and Mr. GERALD BELLHOUSE, Superintending Inspector of Factories, has been appointed junior Deputy Chief Inspector.

It is stated that the Deputy-Controller for Auxiliary Shipbuilding, Admiralty, has appointed Lieut.-Colonel J. MITCHELL MONCRIEFF, R.E., M.Inst.C.E., to be Director of Engineering Work, to deal generally with all civil engineering matters which may arise in connection with his department.

Mr. G. M. CLARK, formerly of the engineering staff of the Victoria Falls Power Co., has, according to the *South African Mining Journal*, been elected President of the S.A. Institution of Engineers for the year 1917-18.

At the Midland Hotel, Manchester, on Thursday last week, the staff of Mr. L. E. Wilson, of Manchester, welcomed the

safe return of Mr. D. G. SUMNER, the chief engineer, after carrying out some important work for the firm in Persia. Those present, especially the telephone engineers, were interested in his account of the difficulties experienced in carrying out technical work in the Far East.

Roll of Honour.—We regret to record that Rifleman W. H. BECK, Rifle Brigade, was killed in action on July 31st, aged 34. Rifleman Beck was a member of the staff of the ELECTRICAL REVIEW Printing Department, which he entered as an apprentice 20 years ago. He will be remembered by his associates for his quiet and unassuming disposition, and will be greatly missed. We also regret to learn that Company Sergt.-Major H. CHILDE, an assistant in the Editorial Department of the ELECTRICAL REVIEW, has been wounded, and is in hospital in France. Both Rifleman Beck and Company Sergt.-Major Childe were members of the ELECTRICAL REVIEW Rifle Club.

The following employes of the County of London Electricity Supply Co. have been killed in action:—Private F. H. Bent, 3rd S. Wales Borderers; Private A. Goldsworth, 23rd County of London Regiment; Private L. W. King, 4/2 County of London Royal Fusiliers; Lance-Corporal E. A. Price, 1st Battalion Essex Regiment; Driver James E. W. Purcey, R.F.A.; Private G. White, R.A.M.C.; Gunner W. Whapshott, R.G.A.

Lieutenant LEWIS PEAKE, late sub-station attendant in the Poplar B.C. electricity department, has been killed in action. Lance-Corporal W. HENDERSON, K.O. Royal Lancaster Regiment, who has been wounded, was employed at the Bispham District Council electricity works.

Private H. DAVENPORT, Gordon Highlanders, who was employed at the British Westinghouse Works, Trafford Park, has been killed in action.

Private W. LOWE, S. Lancashire Regiment, reported killed in action, after being missing since October last, was employed by the St. Helens Cable & Rubber Co., Ltd.

Sergeant A. CLARKSON, R.F.C., aged 23, reported killed after a raid over the enemy's lines, was employed by Messrs. Calverley & Co., electrical engineers, Burnley.

Sapper W. WILLIAMSON, R.E., who has been dangerously wounded, aged 40, was employed by Mr. F. G. Waters, electrical engineer, Leeds.

Corporal C. CARPENTER, R.E., awarded the Military Medal for rescuing wounded under fire, was engaged at the Charlton works of Messrs. Siemens Bros.

Private M. O'CONNOR, Cheshire Regiment, reported killed, was employed by Messrs. Charles Macintosh & Co., Ltd., Manchester.

Private A. H. CAMPION, Essex Regiment, who has died of wounds, was in the electrical department of Messrs. S. Pearson & Sons, West Thurrock, Grays.

Private F. DIMMOCK, London Regiment, who was with the Telegraph Construction & Maintenance Co., of East Greenwich, has been killed in action.

Gunner C. HUGHES, R.F.A., who was with Henley's Telegraph Works Co., Ltd., North Woolwich, has been killed in action.

Wireless Operator A. C. TRUMAN, reported missing (aged 31) after the torpedoing of a merchant steamer, had been for 15 years with the Marconi Co.

Gunner W. D. DUNCOMBE, for some years at the Rugby works of the B.T.H. Co., has been killed in action.

Private TOM WHITHAM, of the Coldstream Guards, who has been awarded the Victoria Cross, was employed in the Burnley Corporation tramways department. In a letter to Mrs. Witham, Mr. H. Mozley, tramways manager, has sent his congratulations.

Private J. J. WALKER, Cameronians, killed in action, was an electrician engaged with a firm at Dornoch, Annan.

Private GEO. RAWSON, Royal Berks. Regiment, who has been killed in action, was with Messrs. Thompson, electrical engineers, Kettering.

Sapper J. E. WEST, W. Lane. Sign. Section, who has been awarded the Military Medal, was employed as a wineman at the United Electric Car Co.'s works, Preston.

The Military Cross has been awarded to Lieutenant N. F. HAWES, Machine Gun Corps, of the County of London Co.'s mains department, for bravery in action on the French front on June 21st, 1917.

Obituary.—Mr. J. E. TONGUE.—The death is reported of Mr. J. E. Tongue, Ash Mount, Rotherham, partner in the Rotherham Electrical Engineering Co., Ltd.

Mr. T. MITCHELL, SEN.—Mr. Thomas Mitchell, sen., passed away, in his 76th year, on September 16th at his residence near Bolton. Until a few years ago the deceased gentleman was senior partner in the firm of Messrs. Thomas Mitchell and Sons, engineers and merchants, Bolton. The business is being continued by his sons.

Will.—According to the *Times*, Mrs. ELIZABETH DACK DENNING, of South Norwood, widow of the late Ald. Denning, of Croydon, has left estate of the gross value of £169,719, the net personality being £78,581. The testatrix bequeathed to the Public Trustee all her freehold property in trust for a "Frank Denning Memorial" for the advancement and propagation of education in mechanical science in any part of the United Kingdom, with preference to those persons who reside in the Borough of Croydon.

NEW COMPANIES REGISTERED.

British Automobile Equipment Co., Ltd. (148,441).—

Private company. Registered September 11th by Elvey, Robb & Welch, 19, Bedford Row, W.C. Capital, £100,000 in £1 shares (50,000 7 per cent. cum. pref.). Objects: (1) To acquire certain patents and rights (a) from Accurate Magnetics, Ltd., and H. D. Grant, and (b) from H. D. Grant, (2) to acquire from F. Lamplough the business of an aviation, motor, and general engineer carried on at 106 Highfield Works, Feltham, Middlesex, as Lamplough & Co., and certain freehold lands, plant, buildings, &c., (3) to enter into an agreement appointing G. F. Cooke electrical engineer. The subscribers (each with one pref. share) are: J. J. Sneddon, Finsbury Pavement House, E.C., chartered secretary; S. Fortescue, Finsbury Pavement House, E.C., company director; B. Hedley, 7, Great Elms Road, Bromley, Kent, clerk; A. T. Pendey, 11, Heathland Road, Stoke Newington, N., company director; A. W. Comer, 5, Cawley Road, E.9, accountant; J. E. Cater, 45, Arabin Road, Brockley, S.E., clerk; F. W. Ramsey, 32, Westbury Road, Barking, Essex, clerk. Minimum cash subscription, £7. Registered office: Finsbury Pavement House, E.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Lancashire Electrical Engineering Co., Ltd.—Debenture dated August 22nd, 1917, to secure £200, charged on freehold works at Ashton-under-Lyne, and the company's general assets. Holder: A. Seymour, Ashton-under-Lyne.

Clevedon, Portishead & District Electric Supply Co.—Particulars of £5,000 debentures created August 14th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

British Westinghouse Electric & Manufacturing Co., Ltd.—Particulars of £500,000 second mortgage debentures created May 7th, and secured by trust deed dated August 22nd, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908. None of the debentures are issued at present. Property charged: Certain lands and buildings at Stratford, Lancs., and the company's undertaking and property, present and future, including uncalled capital. Trustees: Trustees Corporation, Ltd.

Wright & Wood, Ltd.—Mortgage dated August 29th, 1917, to secure £520 16s., charged on land at Halifax. Holders: Halifax Permanent Benefit Building Society.

Foster Construction Co., Ltd.—Charge on proceeds of Government contract for steel work (total amount £4,320), dated August 18th, 1917, to secure all moneys due or to become due from company to London and South-Western Bank.

Electric Construction Co., Ltd. (39,292).—Capital, £400,000 in 300,000 ord. and 100,000 pref. shares of £1 each. Return dated June 14th, 1917. 224,200 ord. and 62,780 pref. shares taken up; £40,690 paid on 4,200 ord. and 36,490 pref.; £246,290 considered as paid on 220,000 ord. and 26,290 pref. Mortgages and charges: £165,000.

Electric & General Investment Co., Ltd. (31,506).—Capital, £201,500 in 19,900 pref. and 20,000 ord. shares of £5 each, and 40,000 def. shares of 1s. each. Return dated July 17th, 1917. All shares taken up. £5 per share called up on the pref., £1 per share on the ord., and 1s. per share on the def.; £121,500 paid. Mortgages and charges: £26,681.

Evershed & Vignoles, Ltd. (43,206).—Capital, £30,000 in £10 shares. Return dated July 6th, 1917. All shares taken up. £30,000 paid. Mortgages and charges: £15,000.

D.P. Battery Co., Ltd. (44,084).—Capital, £10,000 in 4,996 "A," 4,996 "B," and eight other shares of £1 each. Return dated July 26th, 1917. 10,000 shares taken up; £10,000 paid. Mortgages and charges: £18,000.

Electrical Engineering & Equipment Co., Ltd. (115,089).—Capital, £10,000 in £1 shares. Return dated July 20th, 1917. 4,002 shares taken up; £4,002 paid. Mortgages and charges: Nil.

CITY NOTES.

County of Dorset Electric Supply Co., Ltd.

At the annual meeting, held in July, Dr. J. A. HOSKER, who presided, said that there had been during the year a setback in the development of the undertaking. The gross profit at £937 showed a decrease of £334, and after allowing for interest on loan and hire-purchase agreement there was a net deficit of £72. Cost of fuel and all materials had enormously advanced, and the use of lighting current was restricted. It was impossible to obtain materials for extensions, so that additional customers could only be connected to the mains already laid. Thirty new consumers had been added, bringing the lamps connected up from 15,448 to 20,426. The units sold were 207,252, against 193,458. The Swanage and Lyme Regis companies showed a profit on working, and Blandford a small loss. When times became normal again the rate of progress would become considerably accelerated. The estimated receipts for the first six months of this year were £1,871, against £1,664 in the corresponding period of last year. Lieut.-Col. W. H. Baxter, a director, had been killed on active service, and three other directors were engaged on military duties, and upwards of a third of the staff were with the Colours.

Globe Telegraph & Trust Co., Ltd.—Interim dividend of 2s. per share on ordinary shares, free of tax, for the past quarter.

Direct Spanish Telegraph Co., Ltd.—In addition to the dividend at the rate of 10 per cent. per annum on the preference shares, an interim dividend at the rate of 4 per cent. per annum, free of income-tax, on the ordinary shares is announced, both for the half-year ended June 30th.

British Insulated & Helsby Cables, Ltd.—Interim dividend of 7½ per cent. (7s. 6d. per share), less income-tax, on ordinary shares, as compared with 5 per cent. for the corresponding period of last year.

Manila Electric Railroad & Lighting Corporation.—Dividend of 1½ per cent. for the quarter ending September 30th on the common capital stock.

British Aluminium Co., Ltd.—Dividends at the rate of 8 per cent. per annum on the ordinary and 6 per cent. on the preference shares, both less income-tax, for the half-year ended June.

Eastern Telegraph Co., Ltd.—Dividend at the rate of 3½ per cent. per annum, less tax, on the preference shares for the quarter ended September 30th; second quarterly dividend of 1½ per cent. on the ordinary, free of tax.

Eastern Extension, Australasia & China Telegraph Co., Ltd.—Second quarterly dividend 3s. per share, free of tax.

STOCKS AND SHARES.

TUESDAY EVENING.

Stock Exchange markets have recovered their balance, thanks to the better news from Russia. Moreover, the Swedish incident has ceased to be any pronounced factor for the time being. All stocks and shares connected with Russia have improved sensibly, and this has had a decided effect upon the investment departments more particularly.

Money continues to pour into the Stock Exchange from the provinces. Possibly there is less speculation for the time being amongst industrial shares; but the rubber market furnishes conclusive evidence of the way in which buyers in the North and the West of England are ready to look at anything which promises a reasonable hope of a rise in price.

The Home Railway market continues to be one of the few glum parts of the House. There is a slightly better tone about the stocks, and the latest settlement of the Labour dispute in Scotland was declared to have a steadying effect upon prices. All the same, people decline to look at stocks in this section; and the Undergrounds have once more relapsed into their customary condition of quietude. Underground incomes remain at 8½ ex dividend.

About half-a-dozen of the leading shares in the home electricity list are quoted ex dividend, amongst them being the ordinary and preference of the City of London and the County of London companies. There is not much change in the quotations, allowing for these markings, but Bromptons at 6½ are 5s. up, and Westminster have again advanced, this time to 6½. There is a noticeable demand for all the shares in the group; and the reversion once more to Greenwich time has quickened, as we were pointing out last week, the interest taken in illumination companies.

The manufacturing market is decidedly good. Callenders have risen to 14½, General Electric ordinary to 17, and India-Rubber shares to 13½. So far as the last-named are concerned, there are buyers about at the price, but holders are retaining their shares, and seem perfectly content to keep them, notwithstanding the sustained rise which has occurred during the past two or three months. Business continues active in the various Edison Swan shares, though there has been something of a reaction from the best, due to profit-taking. Moreover, in the absence of more detailed information, the tendency is to go a little slowly. The 7 per cent. preference shares are changing hands on the basis of 1 1/16, and those 10s. paid at 11s. 3d.

The Mexican group is again dull. Mexico Trams and Mexican Light & Power issues are both rather lower, with the exception of the 6 per cent. bonds of the former company, which have risen to 40. Brazil Tractions went back to 46, most issues connected with the Republic having eased off because of the continued dullness in the rate of exchange. The 1½ per cent. debenture stock of the British Columbia Electric Railway is quoted ex dividend, and at the present price of 52 the yield once more looks tempting.

Globe Telegraph & Trust shares of both classes are better, the ordinary rising to 13 and the preference to 10½, these showing rises of 5s. and 2s. 6d. respectively. The attraction in the ordinary shares is, of course, the fact that the dividends are still paid free of tax. The Eastern group is steady,

and Anglo-American preferred at 98½ shows a rise of the fraction. Marconis at their nominal price of 3½ are not quite so good as they look, there being sellers about in the market at this figure. Oriental Telephones eased off to 3½, and United River Plates to 6½, which is not very surprising considering the way in which the prices of both have been rising of late. West India and Panama also are a little easier at 28s. 9d.

The Direct Spanish Telegraph Co. has declared its usual interim dividend at the rate of 4 per cent., free of income-tax, on the ordinary shares, and the price keeps very firm at 5½; while the 10 per cent. cumulative preference changed hands about a month ago at 7½. Business has been done this week in Direct United States Cable shares at 6½; and the demand for these stocks has reached the prior-charge issues, Eastern 3½ per cent. preference being done lately at 61, and the 4 per cent. mortgage debenture stock at 72. These prices, it may be added, compare with 77½ and 96½ respectively at the outbreak of war, when, it may be superfluous to recall, the value of money was very different from what it is to-day. Western 4 per cent. debenture stock stands at 73, and Eastern Extension 4 per cent. debenture stock at the same price.

The activity in the rubber market has already been mentioned, and prices are forced up by the persistence of the buying from the provinces. The armament group, too, is good, with Armstrongs up to all but 40s. There is more doing in the tin section, and the big rise which has taken place in the price of silver is having its due effect upon the shares in companies connected with the metal.

ELECTRODES FOR ELECTRIC FURNACES: THEIR MANUFACTURE, PROPERTIES, AND UTILISATION.

(Continued from page 246.)

Life of Electrodes; Consumption and Protection.—The rate of consumption of electrodes is very variable, depending as it does on the quality of carbons, type of furnace, method of protecting electrodes, and on the manufacturing process concerned. Consumption is due principally to:—(1) Dissociation by the current; the working voltage may be either too high or too low; (2) chemical combination of the electrode with oxygen from oxides in the charge treated, oxidising slags are particularly injurious; (3) solution of carbon in the metal, to form carbides, silico-carbides, &c.; (4) direct oxidation by atmospheric oxygen; this action may be very rapid, owing to the high working temperature. Fig. 7 shows two

FIG. 7.—UNPROTECTED AND PROTECTED ELECTRODES.

electrodes, one unprotected and one protected by an incombustible insulating sleeve R. That part M of the electrode which is plunged into the charge is protected against oxidation by the oxides of carbon liberated in the furnace. The exposed portion P, on the other hand, is intensely hot and subject to rapid oxidation by the air. A "neck" is formed in the electrode, and the increased electrical resistance at this section causes intense local heating and still more rapid reduction of section, until finally M breaks away—wasting material and possibly spoiling the charge.

One must not burn electrodes too close to the terminal clamps for fear of injuring the latter; but the loss in rejected stumps is a serious item. New electrodes may cost £16 per ton, and stumps may be worth 32s. per ton as raw material for fresh electrodes. The scrap value is thus only 10 per cent. of the value new, and a 5-ft. electrode may have to be rejected when the stump is 2½ ft. long—i.e., there is a waste of nearly 50 per cent. It is now usual to reduce the actual loss by utilising stumps in one way or another. The stumps themselves may be tapped and threaded so as to be screwed together, this process being particularly applicable to

FIG. 8.

FIG. 9.

cylindrical graphite electrodes. Alternatively a copper screw may be used (fig. 8), or a number of pieces may be held together, as in fig. 9, by metal rods *m*; the junction between the pieces is then one of simple contact. In any case, however, trimming the irregular ends of stumps involves more or less waste.

The most effective protection for electrodes consists of a sheath of incombustible material. Mixtures which have been proposed for this purpose are:—Retort coke and sodium silicate; lime and limestone with carbon; and potassium or sodium silicate with chalk. These mixtures applied cold form a covering which is a good resistant to heat. Other protective coatings used are asbestos wool with silicates; milk of white clay; and silundum. The last is an amorphous compound resembling carborundum; it is refractory, incombustible, and (being a compound of carbon and silicon) it is useful for protecting electrodes in ferro-silicon furnaces. An iron netting may be used to support a paste of sodium silicate and clay or of kaolin and asbestos. Sometimes granular material unaffected by oxidising gases is embedded in the surface of the electrode; quartz, alumina, or carborundum may be used according to the nature of the products made in the furnace. Rigid envelopes of asbestos board or sheet-iron have also their uses, though care is required to prevent air circulating between electrode and sheath, which then forms a draught chimney and intensifies the damage.

In this connection, M. Ch. Louis recommends that the electrode be protected by an agglomerate of magnesia or dolomite, 3 to 5 cm. in thickness, inside a jacket of 1-mm. sheet iron. The agglomerate is heated for mixing, and contains 6 to 7 per cent. of pitch and 5 to 8 per cent. of tar. Adherence on the electrode is increased by chipping its surface and painting it with tar. The sheath being held in place by an external mould, the agglomerate is packed tightly between it and the electrode. The mould is then withdrawn and a joint is made at the top, between sheath and electrode, by a paste of silicate or refractory earth. It is not essential to re-bake an electrode thus protected.

The Gin process is to embed the electrodes in a carbon agglomerate. With this end in view, the electrodes are formed of

several cores (say, eight or ten), and the agglomerate is a mixture of coke or ground electrode stumps with pitch or tar. The agglomerate forms simply a mechanical bond between the electrodes; it is not traversed by any considerable fraction of the current, and is, therefore, at a much lower temperature than the cores, and is less exposed to oxidation. Its protective action endures beyond the point in the furnace at which iron sheathing would be melted away.

Important though it is to reduce wasteful consumption of electrodes, it is evident that a protective coating of any sort carries its impurities into the manufactured product, and for this reason it is sometimes better to do without the coating and simply modify the shape of the electrodes. In several aluminium works, for instance, very short electrodes are used in the shape of truncated pyramids with the larger end above. The use of short electrodes is undoubtedly the best policy when protection against oxidation cannot be obtained effectively and acceptably.

The rate of electrode consumption referred to unit weight of product manufactured varies widely with the product concerned, and with the type of furnace employed. For instance, in the manufacture of 25 per cent. ferro-silicon, the electrode consumption is about 3 mm. per hour, increasing to 4 mm. per hour when a 58 per cent. silicon alloy is made. Manganese-silicon alloys involve a mean consumption of 3 mm., and calcium carbide of 2 mm. per hour. All these figures refer to covered furnaces charged continuously, in which consumption is always a minimum.

In aluminium manufacture the electrode acts not only as current conductor, but also as comburent, and its consumption is generally proportional to the quantity of metal produced—say, 700 gm. per kg. (1,560 lb. per ton) of metal produced.

In steel furnaces of direct-production type, with electrodes about 2 metres long, consumption varies with the process. The following table shows the net weight of electrodes burned effectively* in various works:—

Furnace.	Electrode consumption per ton of steel.		Remarks.
	Kg.	Lb.	
Stassano, Turin ...	7 to 10	15½ to 22	charged cold
Girod, Uguine ...	11·4	25	—
Chapelet, Allevard ...	11·3	24·8	—
Heroult, Le Praz ...	17·5	38·5	—
Lindenburg, Remscheid	2·68	5·9	fluid charge.

Allowing for stumps capable of utilisation and starting directly from ore, the average net consumption of electrodes is now 4 to 5 kg. (8½ to 11 lb.) per ton of steel. In some cases, electrodes have lasted for 1,200 working hours, corresponding to more than six weeks of continuous operation.

Electrode Carriers and Terminals; Cooling Arrangements.—The manner in which electrodes are supported, whilst being left free for up and down adjustment at will, and the manner in which connection is made to the electric supply mains, play an important part in the maintenance and durability of electrodes. Bad fitting

FIG. 10.

FIG. 11.

FIG. 12.

may cause the electrode to become red hot at places, and this in turn leads to breakage or excessive combustion; the damage is cumulative, because the resistance of carbon decreases with increasing temperature, hence current passes by preference through the overheated parts, aggravating their state and exposing them to yet more rapid depreciation.

Defective connections involve serious expense. In one works the maintenance cost for electrode connections alone used to amount to 6s. 6d. per ton of metal produced; subsequently this figure was reduced to 1s. 7d. per ton by various improvements. A saving of £950 per annum was thus effected in this single expense, on an annual production of 4,000 tons.

There are several methods available for the attachment of carriers to electrodes, but the two types at present in use are clamp connections and central connections. Examples of these types are illustrated in figs. 10-14 and figs. 15-18 respectively.

Clamp Connections.—The head clamp shown in fig. 10 consists of a hollow annular piece F, the cavity K in which serves for the circulation of cooling water under pressure. The copper pieces G serve at once for the suspension of the electrode, and for its connection to the supply cables; they are held against the electrode by bronze or cast-iron wedges H, the latter being drawn tight by bolts *i*. The ring R is held in place by set screws *e*, and flexible metal tubing is used to carry water to and from the jacket.

The dovetail clamp illustrated in fig. 11 is used in certain carbide furnaces, the head E of the electrode being dovetailed to fit the cast-iron clamps *b*, which are held by cotter bolts *a*. An iron framework engages with the side pieces *b*, and is provided with an

* That is to say, allowing for stumps capable of being utilised either by fixing them to new electrodes, or by using them in alloy furnaces for producing ferro-silicon, &c.

electrically-insulated suspending hook *c*. Copper plates *e* and *f* are clamped at *h* to the supply cable *g*, and the weight of the electrode ensures firm contact.

Fig. 12 shows an electrode cut back to accommodate a copper cap *c*; good contact is secured by filling with liquid aluminium *d*, or with some other metal of comparatively high melting point. The cap *c* is clamped by an iron shrink-ring *e*, which just slides into place at red heat, and is applied whilst the joint metal *d* is still liquid. The contraction which occurs as the joint cools, ensures excellent contact between the cap, the joint-metal and the electrode. Supply leads *i* are held in machined grooves on the head *f* of the cap by a cover plate *h* and studs *g*. This arrangement gives very good results in service.

Cooling may be secured in all these cases by a water basin near the connection or by a trough of water *m* (fig. 13) surrounding the

FIG. 13.

FIG. 14.

electrode E, and provided, if necessary, with radiating ribs or wings *a*.

The lateral connection shown in elevation and section in fig. 14 was devised by Louis for use in certain steel-smelting furnaces. The electrode is clamped between two hollow jaws of V-shape by a pincer mechanism. The clamps are carried from a horizontal beam *h* by two rods *c*, screwed for part of their length and connected to the jaws by jointed rods *e d*. The jaws are opened or closed by turning *c* in the appropriate direction. When closed, the toggle mechanism exerts a very powerful grip on the electrode. It is convenient and economical to feed the electrode through the clamps (which are slackened temporarily for the purpose), as it is consumed. A connector of this type can be used efficiently for electrodes of slightly different sizes. The supply cables or strips are attached to the pieces *f*, and a padding of copper gauze between jaws and electrode ensures intimate contact even though the corners of the carbon are not quite square. Water is circulated under pressure through the jaws for cooling purposes.

Central Attachment.—Several means for effecting central connections to the ends of electrodes are illustrated in figs. 15–18. In fig. 15 the rod *A* has a screwed portion *m*, which engages

FIG. 15.

FIG. 16.

FIG. 17.

directly in the electrode. Several electrodes (generally four) may be grouped on a single supply cable and supported and adjusted by a rack, with hand or motor-driven gear.

Central axial connection is particularly convenient in certain classes of manufacture and in aluminium works; for instance, the electrodes are often carried by a simple piece of iron—*a*, fig. 16—split and bent to hook shape and embedded in the electrode, before or after baking.

The bronze connector shown in fig. 17 is made hollow for water cooling. Fresh water is supplied at *d* in the basin *a*, and runs into the hollow stem *f*. Overflow runs into the annular reservoir *h*, whence it evaporates; no water reaches the joint between connector and electrode. The recess in the latter for the reception of the connector is larger at the bottom than at the top, and is made with such clearance that molten bronze *k* can be poured in, to

effect connection between B and A, both of which are heated before casting the joint. The bronze used for the joint should be an alloy with fairly low melting point and small contraction. An ingenious means is used to remedy any imperfection in contact due to contraction of the bronze; this consists in running molten tin round the joint at *l*, after cooling. Should the joint become hot in service, owing to imperfect initial contact, the tin melts, flows into the interstices, and effects thoroughly satisfactory contact. The whole of the joint metal may be retrieved when changing electrodes.

In small furnaces the electrodes may be supported and connected to the supply cable by a simple brass eye-bolt, such as that shown in fig. 18.

Hand or Motor Control.—The simplest method of adjusting the position of electrodes is to bring the suspending chain or cable to a winch which may be operated manually or by a hand-controlled motor. This control necessitates more or less continuous attention and loss of time both in control and in furnace operation. For this reason, automatic control is to be preferred. A Thury type D.C. or A.C. regulator may be used to control a starting and reversing switch, and thus start in one direction or the other, a servo-motor geared to the electrode mechanism (fig. 19).

The supply cables may be bolted or welded to the electrode terminals, but flexible conductors must be used in either case. In order to eliminate any appreciable restraint on the movement of

FIG. 18.

FIG. 19.

FIG. 20.

the electrodes and to reduce the risk of melting the flexible connections, Keller uses strips of thin, flexible copper attached to two symmetrical supports and bent to zig-zag form. Rings *b*, *b* (fig. 20) prevent the strips from sagging into the flames or causing short circuits.

Where several electrodes are used simultaneously in a single furnace, it must be possible to manipulate the electrodes separately or simultaneously. A variety of mechanisms and controls is available for this purpose.

(To be concluded.)

THE MUNICIPAL TRAMWAYS ASSOCIATION (INCORPORATED).—I.

ANNUAL CONFERENCE.

YESTERDAY the annual conference of the Association was opened at Blackpool, the reading of the Presidential Address by Mr. HENRY MOZLEY (general manager, Corporation Tramways, Burnley) being the first item on the agenda.

After referring to the circumstances which had compelled the suspension of new construction for the time being, Mr. Mozley said that ever since his introduction to municipal life he had felt it an absurdity to repay the whole capital, within very limited periods, of an industry like that of the tramways, which was ever growing in value. Why should the first generation of inhabitants make a present to the second generation of property bringing in thousands a year, when this could only be done by burdening themselves with heavy charges annually, instead of taking a legitimate toll or dividend for the moneys expended? He suggested that the policy of municipal authorities providing sinking funds for everything alike, whether for a pure business undertaking such as a tramway, or for works necessary for the conveniences of life, such as streets, sewerage, parks, &c., was wrong; although it might be law, it was the business of this Association to get the law altered. Certain undertakings had felt the inconvenience of the sinking fund especially during the war, but there did not appear to be any prospect of temporarily obtaining powers to suspend the charge, with the consequence that the rates had become liable, and this naturally led to the consideration of fares and their effect on the financial position. Unlike the railway companies, municipal authorities after securing certain statutory fares began to give very much cheaper fares, both for workpeople and ordinary passengers, and in some cases this policy was being continued with disastrous consequences to the financial stability of the undertaking. The Association should exert its influence to help such undertakings to remedy such errors, and secure more uniformity in charges. It was the common experience of all to have flung at them such remarks as

"such and such a tramway gives three miles for a penny, why can't you?" Probably it would be useless to tell the person that the cost of carrying a passenger three miles was considerably in excess of one penny, and that the loss was made up from the shorter journey passenger. It would be better, before taking any steps to secure legislation, for the undertakings concerned to put into operation the power they already possessed of increasing fares, and by open discussion at their meetings healthier and more reasonable views might be created.

In recent years the tramway industry had benefited by standardisation of material used in common, but local standardisation was also desirable; for convenient and economical working all cars should be alike in design and dimension on separate undertakings, and in the case of those having connections with neighbouring tramways and light railways, not only would more economical working be secured, but interchange of rolling stock would be facilitated, and neighbouring tramways might thus assist each other in ordinary development and emergencies. If the Association could do anything to ascertain the best type and most economical car to use, it would confer a great benefit on the industry in the way of cheaper working and convenience in operation. As time went on, and intercommunication was developed, this question would become very important.

From time to time they heard of difficulties and inconveniences arising owing to the long period which had elapsed since the Tramway Act of 1870 became law, and he suggested that it should be made the business of the Association, in combination with the Association representing company undertakings, to take up the revision of the conditions brought about by that Act, and secure more liberty in carrying on the tramway business. There should be one tramway authority in combined areas to control all traffic problems and developments, with representative boards. Every one must be conscious of the incomplete effect of a number of small undertakings operating in what was practically the same district, whereas, if combined, the result would not only be more economical working, but a greatly increased convenience to the public. In these days of manufacturing syndicates what an advantage it would be if combined tramway undertakings could buy their material in bulk. Why should there be any restriction as regards manufacturing for one's own requirements—either cars, working parts, or other material in daily use? The power to do this should be secured by law.

In common with the rest of the business community, it behoved them to prepare for the great changes which were bound to come after the war. Amongst other subjects the questions suggested by the Whitley Report, issued by the Reconstruction Committee, should receive the immediate attention of the Association. Here, at least, they were in a position to carry out without delay one of the principal recommendations, viz.: "The establishment for each industry of an organisation representative of employers and workpeople, to have as its object the regular consideration of matters affecting the progress and well-being of the trade from the point of view of all those engaged in it."

Their organisation being national, and areas being provided in most cases with local associations, they had only one step forward to take, that was to invite representatives of the workpeople to share their conferences and responsibilities. There must be some better way of arriving at agreements for working conditions, wages, &c., than the present inequitable and slow one. Agreements amongst themselves were better than the impositions of an outside and unsympathetic authority.

Tramway Finance.

Some notes on this subject were contributed by Messrs. J. BARNARD (Bolton), G. W. HOLFORD (Salford), and P. PRIESTLY (Oldham). The authors dealt with the main features of the income and expenditure sides of tramway undertakings.

INCOME.

Fares.—The usual rate stipulated in the Acts of Parliament was 1d. a mile, and in some cases this rate was in operation. How, then, could the revenue be increased? By lowering the rates more riders might be attracted, but this could only be done by reducing the penny stage to a half-penny one—a course to which the authors were most strongly opposed—or by lengthening the stages. In either case a considerable increase in the number of passengers carried had to take place before the previous revenue was obtainable, and local conditions must decide whether a sufficient increase would take place to ensure a larger revenue. The only alternative was to increase the rate chargeable per mile, which required the sanction of Parliament; this question was receiving the attention of the Executive Councils of the Association and the Tramways and Light Railways Association. Many undertakings which had been charging less than the statutory limit had increased their fares, with satisfactory results.

Workmen's fares were subject to a maximum of ½d. per mile, and undertakings which charged that rate could not increase the revenue from this source without statutory authority. Little benefit resulted from the introduction of return fares at a cheaper rate, as in most cases the passenger would return by car, even if he had to pay the single fare

for each journey. Even where a profit was shown on the whole, it might be found that the early morning passengers were being carried at a loss, and the passengers paying the usual fares were contributing to make up this loss.

In some instances children's fares were on too liberal a scale. Many concessions had been granted to various sections of the community, and the authors held that they should be withdrawn.

Parcels.—Additional revenue might be obtainable from this source with careful management, and under favourable conditions, but as the use of cars, &c., was not usually charged up against the parcels service, it was questionable whether the system was actually profitable, even where a credit balance was shown. Moreover, the parcels service might have a detrimental effect upon the passenger service.

Advertising.—In the authors' experience the value of a tramcar as an advertising medium was on the down grade, and they did not recommend the practice.

Investments.—The tramway fund should be credited with all the interest accruing from its investments, which in some cases was credited to the general fund account of the Corporation.

EXPENDITURE.

Power.—This was a very important item as regarded both the energy consumed per car-mile and the cost per unit. The consumption varied widely, owing to local conditions, and the price charged to the tramway department was in many cases unfair as compared with the terms offered to manufacturers. The authors held that as soon as the price of coal began to cheapen the price of electrical energy should be reduced in many undertakings, and that a sliding scale with regard to the price of coal should be provided for. Much energy could be saved by careful driving, and systematic inspection of the electrical equipment of the cars; directly things became more normal a thorough overhaul of all electrical and mechanical working parts of the car equipments should be carried out. Car meters, with careful examination of the records, were strongly recommended.

Traffic Expenses.—Some system of standardisation of wages, with a properly constituted authority to settle differences and disputes, was desirable. Labour and materials should be carefully economised, but not by the adoption of inferior quality.

Insurances.—The authors were of opinion that it would be found more economical and satisfactory for each undertaking to carry its own risks.

Repairs and Maintenance.—Here again the utmost economy was necessary, but provision should be made to repair the permanent way in the near future.

The authors concluded with a declaration that municipal tramway undertakings should at all times be regarded as commercial enterprises, and that provision should invariably be made for depreciation and renewals on a sound financial basis before contributions were demanded for the relief of rates or any other purpose.

Differentiation in Fares.

In his paper on this subject, Mr. W. MURRAY (tramway manager, Walthamstow U.D.C.) also dealt with the question of workmen's fares. He pointed out that tramways—at least, in London—were meeting with keen competition in respect of speed and fares, coupled with enormously increased expenses. Differentiation in fares in favour of bona-fide workmen was compulsory, although it meant running at a loss, and such services were kept down to the minimum by the companies which first took up tramway work as a business enterprise. Municipalities, however, had increased them and reduced the fares, so that in London there was a continuous stream of workmen's cars between 3.30 and 8 a.m., special cars between noon and 2 p.m., and again between 5 and 7 p.m., to cope with this traffic, and a rate of 10 miles for 2d. (in one case 19 miles for 2d.) seemed to be about the average. Temperate comment on this state of affairs was difficult. Moreover, many tramway systems allowed all passengers boarding cars before 8 a.m. to purchase return tickets at workmen's rates, which involved a loss to the undertakings. Other concessions had been granted, to school children, blind people, &c., and he submitted that the whole system of differential fares and free travelling was utterly wrong, the only true basis for the fixing of tramway fares being the cost of providing the service rendered, all who availed themselves of that service being required to pay on a uniform scale. There was no justification for carrying a highly-paid mechanic for less than a clerk or shop girl, nor should tramway employes be allowed to travel free. Travelling facilities cost money, like any article of commerce, and to overcharge some sections of the community in order to make good a loss on others was morally indefensible.

In the author's opinion, all municipal tramway undertakings ought to raise workmen's fares to the legal limit, cancel all free passes, and withdraw all special rates. If this could not be done, then the Council concerned should purchase from the tramway department tickets at face value, and distribute them at a reduced price, or entirely free, if thought desirable. This course would free the tramway department from a very serious and unfair handicap, would remove the injustice to ordinary passengers, and would bring home to the public and the council the cost of such conces-

sions. Further, the Executive of the Association should seriously consider what steps could be taken to secure an alteration in the law regarding workmen's fares. If, on the other hand, tramways must go on bearing this burden of preferential rates, in common fairness they ought to be protected from unnecessary and grossly unfair competition.

Other matters that were to be dealt with yesterday were the "Rule of Footpath," introduced for discussion by Mr. J. DALRYMPLE (general manager, Glasgow), and "Development of Tramways," introduced by Mr. ARTHUR ELLIS (city electrical engineer and tramways manager, Cardiff). To-day an extraordinary general meeting is to be held to confirm alterations to the Articles of Association, and the annual general meeting will follow.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

RUSSIA.—A Decree of the Provisional Government was promulgated on July 28th prohibiting, as a temporary measure, the importation of all goods except under licence issued by the "Foreign Supplies Department," or by the Minister of Commerce. The Decree was to come into force from the day that the Customs authorities received telegraphic notice to that effect, but it will not apply to consignments of goods which are shown by the bills of lading, way bills, or port permits, to have been dispatched within three weeks from the date of promulgation of the Decree. The Minister of Commerce is to draw up a list of goods which are not to be subject to this prohibition. Consignments which arrive in Russia, for which the necessary licence has not been obtained, are liable to confiscation.

SWEDEN.—The exportation of the following, among other articles, has been prohibited as from the dates mentioned:—
June 15th: Accumulator cells or batteries, wholly or partly mounted; also electrodes soldered together.

July 23rd: Mica, unmanufactured or pulverised; mica manufactures not specially mentioned in the Customs Tariff.

August 2nd: *Electrical machines, such as generators, motors, converters, transformers, and damping rollers; stators, rotors, current collectors, magnet coils, brush holders, and armature coils exported separately; also parts of all the foregoing—provided they are composed to any extent of non-precious metal other than iron, or are tinned to any extent; accumulators—unmounted cells; incandescent lamps; arc lamps, even if with the globes belonging to them; so-called *Nernst* lamps, and globes, luminous bodies and resistances for the same; searchlights; carbon filaments, even if metalised; metal filaments and bases for electric lamps; carbon brushes (weighing less than 3 kilograms, each), even if combined with other material; safety appliances mounted on porcelain insulators (not plates); starting, regulating, and reduction resistances; controls and other electric regulators; also fitted boards for electric apparatus and instruments; *switches, current interruptors and reverses, and incandescent lamp sockets with or without switches; telephone apparatus; telegraph apparatus, telephone switches and telephone switchboards, also unspecified parts of telegraph and telephone apparatus and of telephone switches and switchboards; *special apparatus for electrical purposes, not specially mentioned, such as apparatus for signalling or conveying messages, Röntgen ray apparatus, apparatus for wireless telegraphy and telephony not included elsewhere, ore separators, &c.; also jack panels for telephone switchboards.

MOROCCO.—The Board of Trade have received from H.M. Minister at Tangier a copy of a new Tariff of valuations of the principal articles of merchandise imported into Morocco. These valuations form the basis on which Customs duties are to be assessed during the second half of the current year. [Goods imported by sea are, with certain exceptions, subject to duty at the rate of 10 per cent. *ad val.*, and also to the special tax of 2½ per cent. *ad val.* imposed by the Algerias Act.]

The new valuation Tariff may be consulted at the Department of Commercial Intelligence, 73, Basinghall Street, E.C. 2.

TRANSIT OF GOODS TO SWITZERLAND *via* ITALY.—In connection with the regulations referred to in the preceding notice, the Board of Trade are informed that arrangements have been made for the issue by H.M. Customs of the "pink certificates," S. 45 A and S. 45 B, in respect of consignments of goods which are exported under licence from the United Kingdom to Switzerland *via* Italy.

JAPAN.—Under an Order of the Department of Agriculture and Commerce the exportation of the following articles from Japan is permitted as from July 1st, provided that the special authority of the Department is obtained:—Tin ore and chloride of tin; nickel ore, nickel, and ferro-nickel; manganese ore, spiegeleisen and ferro-manganese; cobalt ore, cobalt, and ferro-cobalt; molybdenum and ferro-molybdenum; tungsten and ferro-tungsten; antimony; graphite; and mica and manufactures of mica.

* Extension of existing prohibition.

THE WAGES OF CENTRAL STATION WORKERS.

THOSE who have watched the course of the discussions of the last few years regarding the remuneration of central station employes have probably expected that sooner or later the matter would be brought to a head. Apart altogether from the question whether the Electrical Trades Union, the A.E.S.E., or any other organisation is the representative body, we may say that we have never supported niggardliness in the remuneration of this class of worker. The central station employe is worthy of his hire. In the past there has been want of organisation on the part of, and differences between, the men themselves, there has been no approach to uniformity of remuneration even for similar stations, and there has been in war-time little desire to treat the men as though they were performing a national service, which in a large number of cases they undoubtedly are. Our own pages have long contained abundant evidence that there has been continuous irritation and disappointment, and at times disaffection, because there appeared to be an unwillingness in certain directions to meet the men in the matter, and to adequately consider their claims. We have no desire to prejudge the case as it has developed under the changing conditions of war-time, conditions of which the Electrical Trades Union has not failed to take full advantage. Before the war broke out, that Union certainly did not represent the interests on behalf of which it now agitates. In those days, when the Union wanted to capture the central station men we attended a number of the meetings at which grievances were discussed. We do not hesitate to state that one of the things that then seemed to us to be throwing the employes right into the arms of the Union was the suspicion that the station chiefs and their authorities were disinclined to give a just hearing to complaints. The Union propaganda has been assisted by the A.E.S.E. policy of remaining inactive, on patriotic grounds, so as not to hamper the progress of the war. If there has been a disinclination to consider with reasonable generosity the war-time burdens of the men, it is easy to see that such dissatisfaction would materially assist the Electrical Trades Union in its propaganda, especially among what we may call the non-professional class of employes. Therefore, it is not surprising to learn from a report of the Hackney Municipal Electricity Committee that there "appears to be serious unrest prevailing throughout the electricity undertakings of Greater London at the present time." This unrest is "alleged to be mainly due to the delay on the part of various authorities in paying war wages awarded to the shipbuilding and engineering trades by the Committee on Production." Pressure is being brought to bear upon the Ministry of Labour with a view to securing a 48-hour week, increased normal pay to what is claimed to be paid in Government service, and the Committee on Production's awards in the engineering trades as war wages. As a result, the Associated Municipal Electrical Engineers (Greater London) have now decided to take steps to secure an agreement between the authorities and the Unions, and to introduce, as far as possible, uniformity throughout the London area. As stated elsewhere

in this issue, municipal authorities are now appointing delegates who will form a body to treat with the electrical and other Unions, and to secure the reference of the points to conciliation or arbitration if they fail to come to an agreement.

As we have said, it was, in our opinion, inevitable that something would have to be done sooner or later, and while we have no desire to prejudge the case, we cannot help regretting that it is only under pressure that there is now a prospect of matters being properly dealt with. We cannot regret that the whole subject has taken the present turn, whatever we may think of the past of the Electrical Trades Union, for it is a matter of which most of us have become weary. It is true that the new body now being appointed has relegated to it an investigation arising mainly out of war-time conditions, but it has a great opportunity of laying down a basis upon which the subject may be settled for some time ahead. Its task is not an easy one, even if limited to the war-time problem, but if it can so deal with that problem as to lay down principles regarding conditions and wages which may be applied at other times as well, it will have deserved well at the hands of everybody.

In war-time the nation has been trying to settle a hundred old controversies—sometimes it has succeeded. It is only right that we should, as far as possible, clear the way for the vast work of reconstruction that will occupy the serious thought of all of us for a long time to come. If the electrical industry can dispose of the irritating discussions and the fairly universal grievances that have attended employment of many classes engaged in central station operation it will have a clearer atmosphere in which to deal with the whole subject of national electricity supply. It will also have discharged an obligation towards station employes who are now away fighting, that legitimately rests upon it.

Protected Trades Certificates.

SIR AUCKLAND GEDDES, the new Minister of National Service, has lately delivered a speech in which he has shown a disposition to prefer older men behind the lines. The

Times has very rightly suggested to him that this might be desirable if we contemplated remaining practically where we are, whereas it would be a handicap if "movement" became the order of the day. Sir Auckland states that he expects to receive new demands from the War Cabinet for younger men for the Army, and in that connection he would be well-advised to watch what is taking place in the indiscriminate granting to young men of certificates under the Protected Trades Schedule. We report some more cases of this character to-day in our "War Items." It may be perfectly wise to leave some young men in civil life at home—presumably as a general leavening influence, though our own information shows that things would run more smoothly without that "influence" in some districts—but the nation as a whole will not approve of a readiness to leave single young men in unimportant civil positions just because their employers are "on the Government list," while men of years, and with families and businesses, have to be taken for the Army. We should have supposed, especially at this stage of the war, that financial considerations alone would carry weight, the cost of a young single man of energy and good physique being trifling compared with that of a married man, who requires separation allowance, civil liabilities allowance, too, in many cases, with prospective heavy burdens for pensions, &c. But, as in some other things, perhaps we have got to the point where a million or two more or less doesn't matter!

Tramway Finance.

THE Conference held by the Municipal Tramways Association at Blackpool, last week, was remarkably well attended, and proved highly successful; whether this was due to the attractiveness of the agenda or, at least in part, to the amenities of the place, is no doubt an open question, but, as we have remarked in another connection, there is no obvious necessity for all war-time conventions to be held in London, and we incline to the view that the choice of venue in this case was not without its effect on the attendance.

The *pièce de résistance* of the programme was the question how to make ends meet, a subject which is exercising the minds of a good many tramway managers in these extraordinary times, and in this connection the problem of securing an adequate income from passengers to cover the cost of their transportation, with a modest margin on the right side of the account, received the largest share of attention. Tramway undertakings labour under the burden of legislative restrictions even more irksome in some respects than those which hamper electricity supply, and in their case it is more difficult to obtain relief, as the Board of Trade has no power to authorise a variation in the statutory limit of fares; the direct intervention of Parliament is indispensable, and the attitude of that body on such a question is not likely to be sympathetic. So far as regards the ordinary passenger, a charge of one penny per mile does not appear to be unreasonable, and it seems to us that relief should be sought in other directions in which the injustice endured by the tramways under modern conditions is more readily demonstrable.

Prominent amongst these is the "workman's fare," the *bête noire* of many managers. The authors of the papers on tramway finance unanimously inveighed against the statutory requirement that workmen should be carried during certain hours at fares not exceeding a halfpenny per mile, and there is much to be said against the vicious practice of differentiating between different classes of the community, particularly when the concession bears so inequitably upon the public as in this case—for, as we have previously pointed out, it is a gross injustice that clerks, shop assistants, and other people who are often far less opulent than "workmen," should be deprived of the privilege enjoyed by the latter, simply because their working hours are not the same. A somewhat unexpected feature of the discussion, however, was the statement made by some of the speakers that owing to the density of the traffic, workmen's fares returned a profit in their districts. Presumably, therefore, it is rather the abuse than the use of the system that is to blame. The example quoted by Mr. Murray, and recently mentioned in our pages, of a journey of 19 miles for 2d. on the L.C.C. tramways can only be regarded as a monstrosity, but there are other instances of passengers travelling 10 miles for 2d., where 5d. would be the legal charge. The authorities who have sanctioned such fares, probably with political motives, have only themselves to blame if they result in a heavy annual loss, and the system cannot be justified on any ground. We strongly sympathise with Mr. Murray's suggestion that the tramway undertaking should be paid the full ordinary fare in respect of every passenger carried, without exception, and any concessions that the authorities desire to make should be paid for out of public funds, where their cost would be duly recorded and open to criticism. Under the existing conditions, the tramways are most unjustly taxed, not only in the interests of "workmen," a term which generally includes all classes who travel before 8 a.m., but also in respect of upkeep of the roadway which is used by their competitors, and in other ways.

SOME PRACTICAL EXPERIENCES WITH TOUGH RUBBER COMPOUND CABLES.

By W. ELLERD-STYLES, A.M.I.E.E.

WHenever a new commodity is introduced which tends to displace those already monopolising an industry, the inevitable result is a stalwart antagonism from the involved vested interests about to be displaced, irrespective of the virtues of the newcomer. The champions of an inferior commodity usually adopt an assumed name when attacking the new arrival, in order to conceal their identity. The introduction of tough rubber compound cables, hereafter alluded to as C.T.S., has been followed by the usual swarm of vindictive and defamatory letters to the various technical journals as a sequel to its growing popularity.

In reply to such, it is proposed in this article to quote the experience of several well-known contractors, together with details of some of the contracts carried out by each of them, appending their opinions in each instance in order to demonstrate that C.T.S. has been well tried and justifies its general adoption.

Contractors are now beginning to realise the advantages appertaining to the use of C.T.S. for lighting and heating installations, and it is with a view to giving information as to its suitability for power work that this article has been written.

The following are a few preliminary notes from the writer's experience of C.T.S. :—

The lay-out of a power installation is governed more or less by local conditions, but it is possible to adopt a somewhat uniform procedure in every situation; the only difficulty that has shown itself is the earthing of the apparatus. On one occasion a well-known contractor was called upon to install a motor in a position far removed from a suitable earth. It was, therefore, necessary to run the earth wire with the cables, and in doing so he made no attempt at concealment, with the result that the owner of the property made heated protests at seeing a bare copper wire run throughout the premises, as he presumed it to be a live wire. A simple remedy existed in threading the earth wire through the cleats at the back of the cable; a saw cut in the bottom of the groove is sufficient.

As to the kind of cable to be used for the heavy class of work, it is most suitable to use the circular section, twin or triple, as required, for the main runs, and single for connections between the motor and switchgear or control apparatus.

If it is necessary to run the C.T.S. cable underground, it can be laid without further protection, unless in a shallow trench, when warming bricks should be laid a few inches above it. For most situations the cable should be supported by cleats at frequent intervals to avoid sagging; for the lighter cables noncorrodible metal or ebonite saddles may be used. Where it is necessary to run the cable overhead, an auxiliary wire may be used to support the cable with the aid of suitable suspenders at frequent intervals.

Three reports have been selected for inclusion in this article from firms of high standing, and several useful hints are given which need no emphasis from the writer, as they are written by practical men.

Messrs. Bertram Thomas, electrical and mechanical engineers and contractors, Worsley Street, Hulme, Manchester, give the following report on C.T.S. wiring :—

"We would say that it gives us much pleasure to put forward jobs we have undertaken with C.T.S. cable. We instance four as follows, but would say that these jobs have practically been lighting jobs throughout. Of course, there has been a small amount of power work, but it has been very small considering the size of the jobs :—

"—— Sanatorium, for Manchester Corporation.—A hospital for soldiers. About 800 lights wired with approximately 10 miles of C.T.S. cable of various sizes.

"—— Mill, Failsworth, Manchester.—A cotton-spinning mill. About 350 lights wired with approximately 2½ miles of C.T.S. cable of various sizes.

"—— Mill, Failsworth, Manchester.—A cotton-

spinning mill. About 200 lights wired with approximately 2 miles of C.T.S. cable of various sizes.

"—— Co., Ltd., Trafford Park, Manchester.—A lard refinery. About 500 lights and some motors wired with approximately 4 miles of C.T.S. cable.

"From our experience of C.T.S., we have certainly found it quite satisfactory on these jobs up to the present. The method of running the cables has been fixing of same with suitable metal saddles, and in each instance we have only used single cable.

"With reference to the —— Co., we have run a considerable amount of the cable in the outbuildings there on cleats, and we find it very satisfactory from the *water-proof point of view*. The reason for using these cables in most instances has been that they are *waterproof*, and, as a consequence, we are getting little trouble from earthing or short circuits."

It is interesting to note that this report emphasises the waterproof qualities of C.T.S.

Messrs. Chas. Richardson & Sons, Romily, near Stockport, give an interesting description of power jobs, and they emphasise the great saving of labour over other wiring systems and the facility with which alterations and rearrangements can be carried out. Their report states :—

"We have pleasure in giving a rough outline of one or two of the installations we have carried out in C.T.S., viz. :—

"In a dye works, under particularly bad conditions, *V.I.R. cables both on cleats and in conduit had completely failed* on account of damp and acid fumes. We have wired some 200 lights and several motors of 1 to 6 h.p. in C.T.S. on 220 volts—the major part of it dating back some three or four years—and up to the present it has been a *complete success*. The *saving in labour* was found to be a very important consideration.

"In another case of a large felt works we recently cabled two motors of respectively 100 H.P. and 53 H.P. on a 400-volt three-phase supply, with three-core 600-megohm C.T.S., and it made a *very neat installation* saddled up with metal saddles. Here again was shown a considerable saving of labour when compared with other systems.

"In another instance we installed C.T.S. cables on a 250-volt D.C. installation in an asbestos process works. Some 250 lights, with a number of motors varying from 2 H.P. to 15 H.P. The saving of labour greatly influenced the use of C.T.S. in this work. We might mention another feature of this job, viz., that a considerable amount of alteration and re-arrangement has been done from time to time, and the open C.T.S. system has lent itself very well to work of this kind.

"Among other jobs we have used C.T.S. extensively in a leather works and tan yard for cabling to a large number of motors from 5 H.P. to 100 H.P., and it has given great satisfaction."

Messrs. P. Allman & Co., of 5, Queen Street, Manchester, have carried out many important installations with C.T.S. in situations of an extremely destructive nature, as shown in the following survey :—

"As you are aware, we have applied this under various conditions, and in almost every case without any other protection than its own sheathing, excepting where it might be subject to severe mechanical damage, in which case a short length of tube has been used, and, in our opinion, there are only three points to bear in mind, and if they have consideration, it is, without doubt, *the most perfect class of electrical cable ever installed*.

"No. 1.—Always use stranded cable.

"No. 2.—See that the cleats are of correct size for the diameter of the cable.

"No. 3.—Make sure that the ends of the cables are finished into the right type of fitting, and properly finished off.

"The following are details of a few of the contracts we have carried out in C.T.S. :—

"Ministry of Munitions : Steel Billet Breaking Plant.—1,400 B.H.P. In this instance, 50 per cent. of the wires were *installed in the ground*, and with no other protection than being surrounded by sand before filling in, and we have not had one fault on this job for 12 months.

"Messrs. Watson & Todd.—Underground main supplying

all light sheds, protected as above, installed *three years ago*, in perfect condition at present.

"Cresol-Pieric Acid Works.—300 lights and 200 B.H.P. All neat wiring on surface with switches outside of buildings. Carbolic, nitric, and sulphuric acid used in process, *without any detriment to the wiring*."

"Courtaulds Acid Plant.—300 lights and 180 B.H.P. All wiring on surface, protected from mechanical damage where necessary. Perfect test after nine months' running. Sulphuric manufactured at these works.

"We could, of course, go on with a longer list."

There is little doubt that the above experiences will be appreciated by those contractors who desire proof of the suitability of C.T.S. for hard service, and who require practical demonstrations before they venture to introduce new systems of wiring to their clients.

In conclusion, it is well to point out that the various classes of ironclad switchgear may be installed with C.T.S., using suitable brushes or nipples where the cables enter.

DIRECT-CURRENT BALANCERS.

By W. A. E. M.

It is well known that in approximating the maximum current rating of each machine composing a three-wire balancer set, we take rather more than half the maximum out-of-balance current to be passed through the middle wire.

In the case of balancer-booster combinations where the balancing unit is also required to act as prime mover to a pair of booster dynamos, such calculations are a little more complicated when something better than a rough approximation is desired. The following notes and formulae may provide information of some use to many who handle inquiries and estimates for plant of this kind.

When the boosters of a balancer-booster set are to give an output calling for a motoring current exceeding the out-of-balance current in the middle wire, both machines forming the balancing unit will operate as motors and will take between them all the current called for by such conditions from the bus-bars, the motor connected across the heavily loaded side of the system taking half the difference between the middle wire and booster-motoring currents, and the other balancer machine taking half the sum of the mid-wire and booster-motoring currents.

When the out-of-balance amperes in the middle wire exceed the booster driving current, the balancer machine on the heavier loaded side will act as a generating unit giving a current rather less than half the difference between the out-of-balance and booster-motoring currents and the other balancer machine will work as a motor, taking rather more than half the sum of the out-of-balance amperes and the driving current called for by the boosters.

The two machines forming the balancing unit will, of course, as in the case of the plain balancer arrangement, be identical, each being liable to act in its maximum current capacity, according to the specified conditions of out-of-balance and booster loads.

Neglecting balancer efficiency we get for the current values—

$$c_n = (c_b + c_m)/2, \\ c_o = (c_b - c_m)/2, \text{ or } (c_m - c_b)/2.$$

These are actual values when c_b is greater than c_m , under which conditions both sides of the balancer are motoring, but when c_m is greater than c_b , the actual current values are—

$$c_n = (100 c_m + c_b E)/(100 + E), \\ c_o = (c_m - c_b) E/(100 + E),$$

when—

- c_n = amperes in balancer machine on normally loaded side of neutral wire ;
- c_o = amperes in balancer on overloaded side of neutral wire ;
- c_b = motoring amperes in balancer absorbed by booster load ;
- c_m = out-of-balance amperes in neutral wire ; and
- E = efficiency of balancer $(100 c_o/c_n - c_b)$.

The value of c_b is, of course, $w_b/E_b E_m V_m \cdot 0001$, when—

- w_b = watts output of boosters ;
- E_b = per cent. booster efficiency ;
- E_m = per cent. balancer motor efficiency ; and
- V_m = voltage across balancer motor ;

and may be taken as approximately 5 to 6 amperes per kilowatt of booster output when the voltage either way of the middle wire is, say, 220 ; thus the motoring current in a balancer working across a 440-volt three-wire system will be for a booster load of 10 kw. about 50 to 60 amperes.

When the middle-wire and booster-motoring currents are respectively, say, 50 and 60 amperes, the currents in the balancer will be as shown in fig. 1, and, neglecting efficiency, the same current values exist with an out-of-balance of 60 amperes and a booster-motoring current of 50 amperes, the machine on the side carrying the out-of-balance load in this case acting as a dynamo, as shown in fig. 2.

FIG. 1.

FIG. 2.

When the balancer principle is employed in motor-generator or auto-converter voltage reducer sets, as shown in the diagram, fig. 3, in which system of connection the secondary current is the sum of the motor and generator amperes, the input current through the motor from the high-voltage side will be—

$$c_m = 100 c_s v_d/v_p E_c \text{ or } 100 c_s v_d/(100 v_d + v_m E),$$

and the amperes given to the secondary circuit by the generator will be—

$$c_d = c_s (1 - 100 v_d/v_p E_c), \text{ or } c_s v_m E/(100 v_d + v_m E),$$

when—

- c_m = amperes in motor ;
- c_d = amperes in dynamo ;
- v_m = volts across motor ;
- v_d = volts across dynamo ;
- v_p = primary supply voltage $(v_m + v_d)$;
- c_s = secondary current $(c_m + c_d)$;
- E = combined machine efficiency $(100 c_d v_d/c_m v_m)$; and
- E_c = conversion efficiency $(100 c_s v_d/c_m v_p)$.

Neglecting efficiency, it will be seen that the current through the motor equals $c_s v_d/v_p$ and that the dynamo current is $c_s v_m/v_p$; thus, in the case of a motor-generator working off a 220-volt supply and giving out 50 amperes at 100 volts, the machine currents will be as shown in fig. 3.

FIG. 3.

And if we assume a combined machine efficiency of 70 per cent., the motor current will be—

$$\frac{100 \times 50 \times 100}{(100 \times 100) + (120 \times 70)} \text{ equals } 27.2 \text{ amperes,}$$

and the dynamo current will be—

$$\frac{50 \times 120 \times 70}{(100 \times 100) + (120 \times 70)} \text{ equals } 22.8 \text{ amperes.}$$

It will be found that the actual commercial efficiency—i.e., the efficiency of conversion—works out in the example taken as 83½ per cent.

The balancer system of connection of course offers an advantage only when the voltage reduction ratio is a low one (the advantage being that smaller machines may be used than with the ordinary arrangement of motor-generator having independent high and low voltage circuits) as, on the higher ratios of voltage, the conversion efficiency is low and the current supplied through the motor to the secondary circuit is too small to be of any value.

CURIOSITIES OF EARLY MAINS WORK.

By G. W. STUBBINGS.

MAINS work was not always carried out with the thoroughness that obtains at the present time. This was due not so much, perhaps, to a desire to cut down prices, or necessarily to careless workmanship, but rather, it would seem, to the lack of a general understanding of the reasons that make the various precautions required with paper-insulated and lead-covered cables necessary. As from time to time ancient specimens of cable work are unearthed in the course of renewals or fault repairs, the modern mains engineer gets some little amusement: but the pioneers should not, perhaps, be unduly criticised, for, after all, they were pioneers, and had not the accumulated experience of years to guide them.

Curiosities of early bonding are familiar to all: the prevailing ignorance of the principles underlying this precaution was really remarkable, and has only of late years been dispelled. The most noteworthy case of this kind in the writer's experience occurred at a straight-through box on a .75 C.C. L.T. feeder. The bond was composed of a single strand of 18 s.w.g. copper wire, which had originally been stuck on to the lead of the cable by means of a drop of hard solder. On a fault occurring at another box on the feeder the bond-wire of the box referred to had burnt away, and the fault current burnt a large hole in the lead of the cable in the gland of the box. It is remarkable that this incipient fault never really developed, and it was discovered some four years afterwards during a systematic inspection of the boxes on the feeder in question.

The principle underlying the use of sealing chambers and pot ends does not seem to have been very thoroughly grasped by certain of the old school of jointers. The writer has in mind several examples of lamp services which terminate in a large lead pot end at the top of the post near the cut-outs. It was intended that the two cores of the twin cable should be sweated solid above the compound level, covered with a short length of rubber tube, and taken direct into the cut-outs, to save the jointing of rubber tails. In the particular cases which the writer has in mind, not only had the jointer neglected to sweat the cores solid, but he had allowed the paper insulation to protrude some $\frac{1}{2}$ in. above the level of the compound in the pot end. The most amusing case of this kind, however, occurred in connection with quite a modern job. An underground cable was laid by the supply company for the consumer to connect a subsidiary building with the main building at a certain factory. To supply a single light in a small shed situated between these two buildings, a tapping was taken off the main, the branch cable being a twin $\frac{3}{8}$ in. rubber, lead-covered and armoured. The job was inspected some weeks after completion, and it was found that the end of the V.I.R. cable in the shed had been adorned by the addition of a very large sealing chamber filled with compound. This must have been the gratuitous work of the wiring contractor. The finest feature of the job, however, was the fact that the end of the lead sheathing was a good $\frac{1}{2}$ in. above the compound level in the sealing chamber.

The necessity of a thorough system of cable records, like that of bonding, was not always recognised as well as at the present time. It is certainly a fact that many of the early mains foremen had a remarkable memory, and the early tendency was to rely unduly on this memory, very much as if it were a standard barometer or current balance that could be retained and preserved by the undertaking. A case occurred in the experience of the writer that shows that even an excellent memory is not infallible. In a certain road the east side was cabled throughout and the west side only partly. It became necessary to examine the service box for a house on the west side, past which the distributors were running. Considerable trouble was experienced in locating the service box, which was ultimately found on the east side of the street. It was thought that, as the east-side mains were known to have been laid before those on the west side, the service was connected before the latter mains were laid. A subsequent search through the old stores records revealed the fact that the service had been connected after the west-side mains had

been laid, and the service cable had actually been laid over the west-side distributors, across the road to the east side. The only explanation of so remarkable a piece of work is that no record had been kept of the termination of the distributor on the west side, and that the person then in charge had, relying on his memory, thought that the west-side mains did not extend as far as the house in question. It may be added that subsequently a further similar example was found in the same road.

The fusing of distributors in disconnecting boxes is a matter requiring careful study and consideration in each particular case, and much trouble and inconvenience can be caused by the adoption of a careless and ill-thought-out system. The writer has come across more than one case of fuses, all of equal size, in the three branch distributors of a D.C. three-wire system in a T box supplying a dead end. Fortunately the fuses had never been called upon to operate.

Mention has been made of the circumstance that the defects of old mains works are not always due to a desire to reduce expenditure. This certainly applies to the early practice in a particular system for large consumers. Such practice was to lay two twin services with two service boxes, the result, of course, being that the neutral was double the cross section of the outers. It might be thought that two boxes were used because boxes for two branch cables were not manufactured by the firm supplying the cable accessories; but this was not the case, as boxes for two branch cables were in use for street lamps having both arc and incandescent lighting on the one column. It is difficult to see a reason for the costly proceeding mentioned: it may have been thought that two independent services would give a greater certainty of supply. The additional expenditure for large and long services was hardly justified. This idea calls to mind a system of distribution lately proposed, in which the live main is looped into each consumer's premises, in order that the distributor may, in case of need, be sectionised in each service cut-out box. Such a system sounds very inviting till the cost of a service—say 20 yards long—supplying a demand of 3 amperes off a .2 distributor is considered. As in this case a .2 — .2 — .012 three-core service cable would be required, the advantage of the system is rather expensive. The most futile example of supposed security occurred in the case of a 480-volt service supplying four circuits of 9.5-ampere arc lamps, fed two each way from a switch pillar. The service burnt out and the box was opened up. It was found that four $\frac{1}{8}$ in. lead-covered single cables had been run, two on each pole, and also that there were two fittings on each of the outer mains. As all the cables were taken into an unbonded piece of 1½-in. barrel, the extent of the additional security can easily be estimated. The remarks of the jointer who removed the compound from the service box, and gradually discovered four fittings when he expected to find two, were not lacking in force and character, and, had they not been unsuitable in certain other particulars, they might have been recorded here.

A further curious piece of work occurred in connection with several circuits of street lamps originally intended to work two in series across 440 volts. There was one switch wire only, and each pair of lamps was connected to the switch wire and one outer main. The original idea of the 440-volt system was, presumably, to assist to preserve the balance. Some two years after these lamps had been connected it was decided that a 220-volt system would be more suitable—mainly, the writer believes, on account of the fact that with the original system the lamp and wiring in the bracket were always alive. The change-over was in one or two cases accomplished by altering the polarity of the switch wire from negative to neutral. The original objection, of course, remained, and the lamps were always alive, and the further curious circumstance arose that a fault on the switch wire would not, as a rule, blow the fuse, but would light the whole circuit of lamps.

The foregoing list of curiosities could, doubtless, be supplemented by scores of others that have been observed by various mains engineers. Indeed, it is singular how short a time ago the general ignorance of the principles of cable laying and maintenance began to be dispelled. It is only fairly recently that scientific methods of fault localisation became general, and there are still undertakings in which

such methods are not used, presumably because they are not understood. Such ignorance is, happily, fast dying out, and the average mains engineer of to-day is well equipped with the knowledge necessary for carrying out his duties with efficiency and thoroughness.

A FAULT IN ELECTRIC FURNACE CONTROL WIRING.

In the *Electrical World* of August 18th an account is given of an unsuitable system of control connections and of the method adopted for rectifying it. When the first of a recently-installed battery of Héroult steel furnaces was placed in service, great difficulties were experienced in its regulation, and the maintenance of a balanced current, either by hand or automatic regulation, was found almost

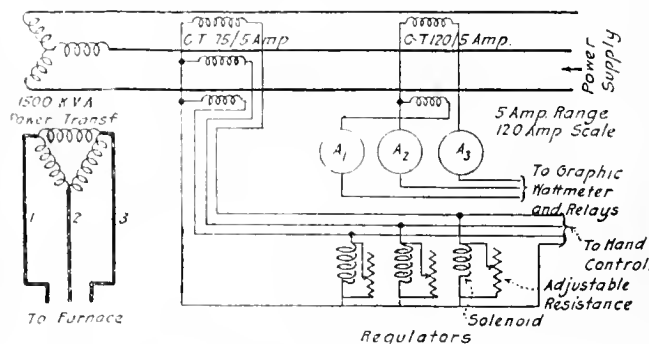

FIG. 1.—WIRING BEFORE CHANGE WAS MADE.

impossible. A balanced reading being obtained on the ammeter, the condition was most unstable, and an increase of current in one line was as likely as not to be further increased by raising the corresponding electrode out of the bath.

The arrangement of the wiring was as shown in fig. 1. The ammeter readings were found to be proportional to the currents in the regulator coils, and the graphic wattmeter circuits were

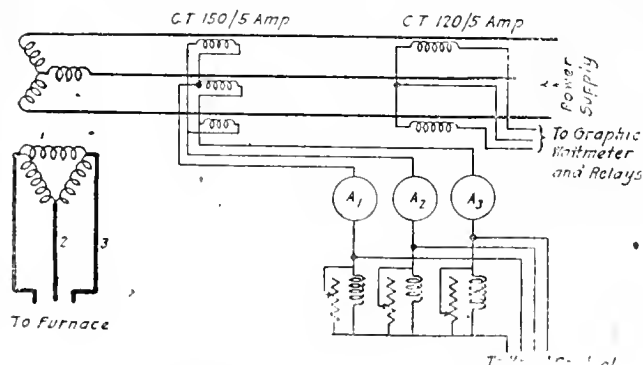

FIG. 2.—WIRING AFTER CHANGE WAS MADE.

normal. The connections of the 1,500-K.V.A., three-phase transformer were found to be star-delta. With such an arrangement the currents in the ammeters and regulators will not of necessity be proportional to those in the electrodes, for the current in each electrode is the resultant of the currents in two secondary windings of the transformer, which are in turn proportional to those in two of the primary lines.

A reconnection of the power transformers was out of the question. Series transformers for the secondaries were suggested, but such transformers suitable for 10,000 amperes could not be purchased or made at short notice.

The problem had a simple solution: The three 75/5 current transformers on the regulator circuits were replaced by 120/5; the secondaries of these were connected in delta, thus duplicating the power wiring; the ammeters were placed in series with the regulators, and the wiring was left as in fig. 2. With these changes made, the furnace was found to operate normally, whether on hand or automatic regulation, and the arrangement was adopted for the other furnaces which were being installed, though it was found desirable to replace the 120/5 current transformers by 150/5 ratio, to get more suitable currents in the ammeter and regulator windings.

Coal Production.—Last year, 998,063 persons were employed in the coal mines of the United Kingdom, as compared with 953,612 in the previous year. The output of coal was 256,318,999 tons, as compared with 253,179,000 tons.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Prospects of the Central-Station Engineer.

It would be illuminating to prospective electrical engineers if you would open your columns to a discussion of the remuneration offered to, and the technical education expected of, a much-exploited profession.

Your article on "The Staff," I feel sure, ventilates the opinions of many excellent junior engineers who have been given the go-by for money and influence.

Staff Electrician.

[Our correspondent is, perhaps, not aware that this subject has on many occasions been discussed at length in our "Correspondence" columns. Its importance cannot be denied, but the obstacles in the way of reform are many and great. Under existing circumstances we cannot recommend young men of ability and ambition to join the staffs of power stations unless it be for the purpose of acquiring a first-hand knowledge of the organisation and working conditions of such stations, as part of their technical training, and not as a career. Of course, in war-time they have no choice in the matter.—EDS. ELEC. REV.]

A "European Concert."

Although I am afraid you will be unable to be present, I venture to send you an invitation and card of the first (pessimistic) anniversary dinner of the "Somewhere in France" electricity supply department.

We complete the 12 months' running this week, so thought it a reasonable excuse for forming a local branch of the Electro-Harmonic Society, for, in the words of George Robey, the restoration of "convivial nights."

I am not quite sure that the Censor will pass the "drawing" of the generating station, which may be considered of military importance to the enemy, for, as someone suggested, it might be identified from the cloud in the background.

It is getting quite an interesting little installation, consisting of slow-speed horizontal paraffin and high-speed vertical petrol sets,

at 2,000 volts, with aerial distribution. At present there are three stations turning out about 150,000 units per year, comparable, I suppose, with Exmouth, Falmouth, Sandown, Ventnor, and undertakings of that size. Of course, our working costs are hopeless, owing to the cost of fuel—portability, simplicity, and ease of erection being the principal factors. Still, we feel that we are keeping our hand in for "after the war" and the return to civil life—whenever that may come.

Ronald Grlerson,

Captain (356 E. and M. Co.), R.E., D.O.E.S.

France, September 16th, 1917.

The City Guilds' Subject—"Electrical Installation Work."

This fundamentally important subject, which, until a year ago, suffered from the entirely inadequate name of electric wiremen's work, is once more under a cloud; and we wonder what the newly-appointed examiner, Mr. W. R. Rawlings, thinks of the matter.

In the new session's "Programme" of the City and Guilds of London Institute there is a prefatory red-ink notice to the effect

that the 1918 Exams. in the above subject will not be held if the war continues. A few non-electrical subjects are in the same boat, and there is a final threat that other Exams. may have to be suspended or modified.

Right up to the present time the fundamental electrical subject has suffered from neglect at the hands of principals of Institutes and heads of electrical engineering departments, who have consistently starved it, while spending money lavishly in other directions. In some Institutions the subject is considered an outside one, and its teacher a temporary member of the staff.

To make matters worse, the C. G. Examination authorities fenced the subject round with absurd barriers tending to discourage or render impossible attendance at the Exams. The various kinds of people who are concerned with electrical installation work cannot, by reason of their employment, always make the stipulated number of attendances; while no provision at all exists for private students to sit for examination. The introduction of this concession would have had surprising results in past years. Our own Exams. make us feel certain on this point.

The final blow, the threat of "no Exam.," is the more serious, as other classes will promptly be dropped. We say "other classes," because right at the beginning of the war some authorities straightway "put the lid on."

To discourage this particular Exam., at a time when recruits to the ranks of electrical workers are badly wanted, seems excessively feeble. It can hardly be a question of expense, for the latter must be very nearly proportional to the number of examinees.

We notice that the subject of gas fitting has not received a similar set-back. What have the I.E.E. and the E.C.A. to say to this?

Up to the session 1915-16 the prizes offered for "Electric Wiremen's (now Installation) Work," depended on the generosity of the Goldsmiths' Company. Now there are none at all. Should this discontinuance of prizes be permanent, so far as the Goldsmiths' Company is concerned, an excellent opportunity will be afforded the I.E.E., the B.E.A.M.A., or the E.C.A. of stepping into the breach.

The Society of British Gas Industries, the Institute of Builders, the Institute of Plumbers, &c., do their best to foster their respective industries in this way.

While the war is bringing home to millions of people the indispensability of electricity in various directions at the Front and in munitions works, it would almost seem that the authorities were bent on discouraging the study of fundamental electrical work otherwise "electrical installation work."

A. P. Lundberg & Sons.

London, N., September 20th, 1917.

The Fusing of an Electric Wire.

As wiring contractors, may we have the opportunity of supplementing your contributor's remarks after criticising the concluding paragraph.

Your contributor: "An electrical installation should be so good that after completion it can be left entirely to itself and almost forgotten."

I.E.E. Wiring Rules 1916, 130: "The value of systematically inspecting and testing apparatus and circuits cannot be too strongly urged. Records should be kept of all tests, so that any gradual deterioration of the system may be detected. Cleanliness of all parts of the apparatus and fittings is essential."

We think you will find that wiring contractors would like the latter rule to read as follows:—"Systematic inspection and tests must be carried out periodically by qualified electrical engineers."

Before an installation is connected up, the authorities and the insurance companies concerned will, perhaps, be most exacting; but afterwards the "budding" electrical engineer fuses up with door keys and wire nails. In large installations, before the contractor has completed his work, invariably one of his wiremen or a labourer is approached, and in due course installed as the firm's electrical engineer; a good man no doubt under supervision, but not fitted for the post.

Whilst the authorities assume their present attitude, this method is of more advantage to the customer until an accident or a fire occurs which calls in an Inspector. He is able to buy electrical material at a cheaper rate than the contractor can sell it to him, and, therefore, the customer receives the support and advice of travellers of some wholesale house, who, in turn, have had no experience of installation work.

This, we submit, is the root of the evil which brings the industry into disgrace, and a remedy should be adopted.

L. E. Wilson.

Manchester, September 18th, 1917.

The E.T.U. and the A.E.S.E.

I should feel obliged if you could find space for the following correspondence that has passed between Sir Geo. Askwith and myself in reference to the Association known as the A.E.S.E.

This Association, as the readers of your valuable paper well know, decided, at the outbreak of hostilities, to suspend operations during the period of the war. They, forsooth, were going to make no effort to benefit the men employed in central and sub-stations: as a consequence, the great bulk of their membership left them and joined the E.T.U. Now that our efforts are beginning to fructify, certain men want to resurrect this dead concern, and, of course, want to be represented before Sir Geo. Askwith. If they were so anxious for the welfare of this section of the industry, why did not they prepare working rules and conditions, and get into communication with Sir Geo. Askwith, &c.? Oh, no. But now that the

spade work has been done, now that an effort is being made by the E.T.U. to improve, not only the status of these men, but also to improve them materially, the A.E.S.E. suddenly appears on the scene, and one can see the hand of the capitalist behind it all.

The E.T.U. recognises no other body as catering for these men. In London alone we have over 700 of them in our ranks to-day, with an ever-increasing membership, and we are not going to rest content until every central-station engineer, be he chief or switchboard attendant, is within our ranks.

W. J. Webb.

London, September 24th, 1917.

"September 20th, 1917.

"Dear Sir,—A large number of replies are being received from borough and supply companies, intimating that they are consulting their Committees or directors, &c.

"Can you give me any information as to the Association of Electrical Station Engineers, 26, Little Park Gardens, Enfield (W. J. Ebben, hon. general secretary), claiming to write on behalf of the executive staff of the central electrical and sub-stations—that is, the charge engineers—and requesting that facilities be given them to be represented at any conference?"

"I am.

"Yours faithfully,

"(Signed) G. R. ASKWITH.

"W. J. Webb, Esq.,

"Electrical Trades Union."

"September 21st, 1917.

"Sir Geo. Askwith.

"Dear Sir,—Your letter of the 20th to hand; and in reply, my Committee would like the result of consultations as rapidly as possible. My Committee are aware that most of the Councils are in recess at the present moment, but the matter from our members' point of view is very urgent.

In respect to the Society you mention, my Committee do not recognise the Association as catering for the men concerned. They are not a Trade Union, and, until a fortnight ago, were dead, but evidently have been resurrected, either for the sake of kudos for certain individuals, or the benefit of the employers.

"Yours faithfully,

"(Signed) W. J. WEBB,

"London District Secretary."

[In our opinion, no investigation made by Sir George Askwith can be complete without a hearing being given to the A.E.S.E. The suggestion that the "capitalist" has anything to do with the A.E.S.E. is grotesque; in suspending its campaign at the outbreak of war, the Association adopted the same patriotic policy as the E.T.U., which, with equal loyalty, abandoned the fight with the wiring contractors which was then in progress, and to misrepresent its motives at this time is unfair and in bad taste.—EDS. ELEC. REV.]

A Static Electricity Phenomenon.

The correspondence on this subject reminds me of a similar experience I had some years ago, when long sparks were drawn from a steam leak at a joint on a Lancashire boiler stop-valve.

The phenomenon is explained in the text-books of electricity and magnetism.

By friction the particles of condensed water in the jet become charged, and, as Sir W. Armstrong found in his investigation with his hydro-electrical machine, he could produce sparks 5 ft. long.

Wm. Frisby.

Electricity Supply Department, Colchester.

September 24th, 1917.

Magnets and Magnetos.

Will any reader kindly answer the following inquiries?—

1. Permanent magnets: Where to obtain best steel for same, average value of B_{residual} and max. value of B (sq. in.) when under process of magnetisation.

Also given B (sq. in.) = 1,000 for a certain steel, what will be value of flux in a path of reluctance Z ?

2. Publisher's name of a book on magnetos dealing fully with theory from a scientific standpoint, and giving all types, past and present.

3. Details of most instructive works dealing with wireless telegraphy and telephony.

B. E. F.

Electrical Rain-Making in Australia.

—In the course of his tour of the east-west railway the Minister of Works and Railways, Mr. Watt, inspected the rain-making device set up by Mr. J. G. Balsillie, late Commonwealth wireless expert, at Bookaloo, and, upon the evidence placed before him, decided that the experiments should be continued. Comparisons made and data collected over some 15 or 16 years indicated that Mr. Balsillie's scheme had induced an increased rainfall of between 50 and 70 per cent. in the Bookaloo area, about 50 miles west of Port Augusta. The Bookaloo apparatus had been shifted to Wynbrong for further trials, which would be continued for a considerable period. The Government proposed to obtain two more plants from Mr. Balsillie, and, after consultation with the Government Meteorologist, use one in New South Wales, and, possibly, one in Victoria, in grazing and wheat growing areas respectively. The cost of each plant, with a full year's upkeep, was about £800.—*Melbourne Age*.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

The Stansiphon.

During the Christmas meetings of the American Association for the Advancement of Science a self-starting siphon was shown, the trade name for which is the Stansiphon.

The self-starting device is shown in fig. 1, and consists of a bulb (1) sealed into the lower end of the tube (2) and an inner tube (5) sealed into the base of the bulb and reaching into the opening of the bulb at the top. Here the end is somewhat constricted, and its size and position with respect to the top of the bulb are so adjusted that an "air trap" is produced at (6). A small opening (7) is made at the lower part of the bulb.

FIG. 1.—A SELF-STARTING SIPHON.

If the bulb be inserted to a considerable depth into the liquid to be siphoned, the liquid flows into the bulb through (7) and displaces the air, which with the water passing through the inner tube (5) rises in a broken column in tube (2) and flows out through the delivery tube (1).

To operate successfully on ordinary liquids the Stansiphon should be immersed to a depth at least two or three times the length of the bulb.

A design has been made which successfully siphons acids from carboys, but owing to the heavy density of these acids it works relatively slowly as compared with water. Light oils such as kerosene and gasoline are readily siphoned by this method, but as yet a suitable design depending on this principle has not been found for the heavier oils.

The wide application of the Stansiphon is apparent especially in chemical laboratories, drug stores, manufacturing and other establishments where liquids and various solutions are in constant use. In transferring corrosive poisons or valuable liquids it obviates liability to accident or waste. It should also have a wide application in the filling and emptying of all sizes of storage-battery jars. When a solution is to be kept "on tap" for instant use, a stopcock may be provided. These siphons in addition to glass are being made of brass, copper, zinc, lead, iron, hard rubber, &c.

Application for patent rights has been made in the name of the inventor, GUSTAVUS A. STORM, but all rights, title and interest in the same have been assigned to the Standard Scientific Co. of New York.—P. B. Perkins, in *Science*.

The "Autofrigor" Small Refrigerating Machine.

Hitherto, the equipment available for producing cold—or rather, extracting heat—on a small scale by mechanical means has involved a good deal of skilled supervision and attendance in respect of belt drives, valves, manometers, and stuffing boxes, &c. A set designed to eliminate the necessity for any skilled attention, and hence to be suitable for use in private houses, has been placed on the market by the Elektrofrigor Gesell. (Berlin), and is described in a recent issue of *E.T.Z.* The working parts are extremely simple, and are assembled in the form of a vertical cylindrical unit. On top there is a squirrel-cage, three-phase, induction motor with vertical spindle and ventilated stator housing. This machine is mounted on, and coupled directly to, a compressor, the cylindrical casing of which is mounted on top and at one end of the refrigerator chamber. The latter is in the form of a rectangular chest, and access to it is obtained by a lid in the remainder of the top. Below the compressor, and entirely within the refrigerator chest, is the vaporising chamber, which is cylindrical in form but of corrugated metal, in order to give maximum cooling surface. The condenser is placed round the compressor housing, and is itself surrounded by a water jacket, through which water is circulated continuously.

Methyl chloride is used as the cooling medium. Vapour is drawn from the vaporising chamber by the compressor, and forced into the condenser. Thence, the now liquid refrigerant passes into the vaporising chamber through a reducing nozzle, and by its evaporation and expansion extracts heat from the surroundings. The expanded vapour is again drawn into the compressor and the cycle repeated. The whole vapour circuit is said to be sealed hermetically, so that the cooling medium needs no replenishing. The cold box can, of course, be used for cold storage or for ice making. No particulars are available as to the power of the motor used, or the

heat-extracting capabilities of the machine beyond the statement that "a temperature of -5° is reached after a few hours' working." The only manipulation required is to open the cooling-water valve and close the motor switch when it is desired to start the machine. The advantage of the squirrel-cage motor in point of simplicity and absence of brush gear is obvious, but one fails to see the point of the recommendation (made by *E.T.Z.*) that a converter be installed to secure this advantage in the refrigerator motor, if three-phase supply be not already available.

A Highly Sensitive Electrometer.

Mr. A. L. PARSON, Chemical Laboratory, University of California, has devised an instrument in which the principle of working in a condition approaching instability is used to increase greatly the sensitiveness of the quadrant electrometer. The box-shaped quadrants are replaced by flat sectors subtending about 70° each at the centre and arranged as shown in fig. 2. Because of the two large gaps between A and B', and between A' and B, the needle hangs stably, as shown by the dotted lines, by virtue of electric forces quite apart from the torsion of the suspension. (Incidentally, this makes it possible to use a torsionless suspension or a float for the needle, which latter has been tried with some success.) If now a potential difference is set up between A and B, the needle is deflected, at first nearly proportionately to the potential difference, and then less and less as the large gaps are approached.

The approach to instability, and hence an increase in sensitiveness, is brought about by means of a mechanical device, which on turning a micrometer screw can be made to widen the small gaps between A and B and between A' and B', thus making the needle

FIG. 2.—QUADRANTS AND NEEDLE OF SENSITIVE ELECTROMETER.

less and less stable in its central symmetrical position. In this way the sensitivity, which in the least sensitive condition is about 3 mm. per millivolt at a scale distance of 5 metres, can be raised to as much as 60 mm. per millivolt easily, and with some care even to 150 mm. per millivolt.

A most important feature of the instrument is that, on account of the relative unimportance of the thickness of the quartz suspension, the sensitivity to potential differences is practically independent of the size of the instrument. The last model made, with a needle 1.8 cm. long, has a capacity of 9 cm., but this could without difficulty be halved by reducing the size of the instrument; and it might be halved again by omitting one end of the needle and the pair of sectors below it.

Although the sensitivity of the electrometer (with the very efficient optical system used) is theoretically great enough to detect 10^{-6} volt, it has not as yet been made steady enough to detect an isolated potential difference of less than about 3×10^{-5} volt. The device was described in a paper presented to the National Academy of Sciences.—*Scientific American Suppl.*

A New British Magneto.

THE BRITISH LIGHTING AND IGNITION CO., LTD., of Tottenham Court Road, London, W.C., have lately brought out a new type of ignition magneto, the B.L.I.C. H.L.S type, specially designed for 8-cylinder engines. Instead of being of the usual rotary armature pattern, the armature has a stationary winding, and an iron sleeve, the latter revolving between the armature core and the pole shoes. Among the advantages claimed for the new machine are that it gives four sparks per revolution as compared with only two in machines with rotating armatures, and that the windings, being stationary, are not subjected to any centrifugal strains.

New Accumulator Plate Separator.

A new accumulator plate separator, which is claimed to be a great advance on wooden separators, has lately been adopted in the batteries made by the WILLARD STORAGE BATTERY CO., of Cleveland, O., U.S.A. The new separator is stated to consist of a rubber composition containing a very large number of threads, which act as wicks. The threads are about $\frac{1}{32}$ in. long, and when wetted by the acid offer, it is claimed, little resistance to the passage of current.

Emergency Storage of Coal.—In the *Electrical World*

of August 18th, a simple and inexpensive method of unloading coal on open ground is described. The railway wagons, with hopper bottoms, are run on to a track, and the coal is deposited on the track and between the sleepers by opening the doors. The coal is pushed off the rails when the wagon is withdrawn by a balk of timber inserted in front of the rear wheels. When the whole length of track has thus been covered with coal, the track is jacked up and rests on the coal, and the process is repeated until the pile is 10 or 15 ft. high, when the track is relaid on the ground and a second pile is begun. To remove the coal, the track is laid on the ground alongside of the pile, and the coal is loaded into wagons by a locomotive crane.

THE MUNICIPAL TRAMWAYS ASSOCIATION (INCORPORATED).—II.

THE decision of the Executive Council to hold the 16th annual conference of the MUNICIPAL TRAMWAYS ASSOCIATION (INCORPORATED) at Blackpool, on Thursday and Friday of last week, was justified by an excellent attendance. Nearly 100 delegates, principally tramway managers, and chairmen and vice-chairmen of tramway committees, were present from all parts of the Kingdom. In addition, there were present as guests, amongst others, Mr. H. E. Blain, of the London General Omnibus Co., Ltd., and Mr. W. G. T. Goodman, general manager of the Adelaide Municipal Tramway Trust, and President of the Tramways Association of Australia.

Mr. Henry Mozley (general manager, Burnley Corporation Tramways), the President, was in the chair, and he was supported by Ald. S. Flint, J.P. (Leicester), the Vice-President, past presidents in Mr. P. Fisher (Dundee), Ald. H. Linsley, J.P. (Salford), and Mr. A. R. Fearnley (Sheffield), the hon. treasurer and secretary *pro tem.*, and by Sir J. W. Courtis, J.P. (Cardiff), and Ald. C. F. Spencer (Halifax), Members of the Council.

The Mayor of Blackpool, Coun. A. L. PARKINSON, J.P., extended a civic welcome to the conference, and remarked that the time had arrived when the tramway committees of the country would have to take into consideration the question of obtaining powers for the revision of fares. The railway companies and gas and electrical undertakings had had that power, and it was necessary in their case, when he found that 16 tramway systems in the country were not able to turn the corner financially, and when 20 systems only made a profit equal to no more than 6d. per 100 passengers. In Blackpool they had a good surplus profit, due to the large number of visitors, but their position was exceptional. One route, Marton, which they opened out some years ago, resulted in a big loss for several years, but the development of property and the increased rateable value had repaid the town many times over.

Thanks to the Mayor were heartily given, after which Mr. MOZLEY gave the presidential address, reported in our last issue.

Tramway Finance.

Mr. G. W. HOLFORD (Salford) read a synopsis of the paper on "Notes on Tramway Finance," of which we gave an abstract last week.

Ald. C. F. SPENCER (Halifax), who opened the discussion in a lengthy speech, said the paper was of a more provocative character than usual, and he welcomed it on that account. He thought the question might be summed up under eight heads: (1) The question of national finance and its effect on municipal finance, (2) the rising cost of wages, (3) the increase in the cost of materials, (4) the increase in fare revenue, (5) the reduction of electrical power consumption, (6) the costliness of Parliamentary procedure, (7) the weakness and strength of municipal administration, and (8) a new adoptive policy. The question of finance was an exceedingly complex one to-day. Before the war, local authorities in Lancashire and Yorkshire were able to borrow at about 3½ per cent. Now, owing to the great cost of the war and other causes, the money rate had advanced, and as, after the war, the demands were likely to be very heavy, the rate of interest would mount still higher. They did not want the local authorities to be competing with the Government afterwards, thus forcing up the rate, and he thought the municipal authorities ought to go as a united body to the Chancellor of the Exchequer, and suggest that it would be far better if the Government borrowed for the whole lot, and then lent the money to the local authorities at a uniform rate. He was sorry to see the reference to the suspension of sinking funds. The suggestion was made in a Manchester paper some time ago, and within 10 days he received 500 letters in reference to the matter. The popular idea of suspension was repudiation, and it would be better if they asked Parliament to remove restrictions, and to enable tramway authorities to raise the fares. He did not believe in local authorities saddling their undertakings with the heavy incubus of rate relief, and he thought that not more than 1 per cent. on its capitalisation should be paid by the undertaking to the local authority. Wages had got to the breaking-point, and he thought there ought to be a uniform adjustment on this question, whilst their workmen ought not to be treated as if they were automatic machines. Regarding fares, they were hide-bound by Parliamentary precedent, and he was inclined to say, with Lord Milner, "Abolish precedents and damn the consequences." Everything had gone up in price except rain, fresh air, and tramway fares. Ald. Spencer advocated the establishment of power stations near the sources of coal and water supplies, the current to be distributed to the local authorities, and condemned the present method of generation as most wasteful. He also urged that the tramways committee should have such statutory powers that its decisions could not be upset by the mere caprice of the Council as a whole. They should have a more commercial administration, and a greater continuity of policy.

Mr. ARTHUR ELLIS (engineer and manager, Cardiff Corporation Tramways) said that many municipalities, including his own, were inclined to regard the Board of Trade Departmental Committee on Electricity Supply with great suspicion. Local authorities ought to have more representation upon it. He was the chairman of the Linking-up Committee for South Wales and Monmouthshire District, and they, like Lancashire and Cheshire, were going to try and show that the Board of Trade Committee was not likely to be required in settling this question. As to increased fares, he believed that the working classes, who did not know how to spend their surplus wealth, would pay them willingly. He condemned the present method of settling disputes through the Committee on Production, as it seemed that the employees had only to threaten the Committee to get what they wanted. They had every desire to be fair to the employees, but they did not like their hands being forced. At Cardiff they carried their own insurance, with the result that after paying one-half of the premium which a company would require they had saved £20,000 in 14 years, and had a good reserve.

Ald. R. T. FLETCHER (chairman, Wigan Tramways Committee), referring to the rise in interest, asked why they should pay interest at all on borrowed money. He suggested that municipalities could issue notes, to be repaid at a certain period, but bearing no interest, and there need be no repudiation of the sinking fund.

Baillie M. W. MONTGOMERY (chairman, Glasgow Corporation Tramways) said that their experience had been that as they had reduced the fares or increased the stages the traffic had gone up by leaps and bounds. Their halfpenny fares were very profitable, but their conditions might not apply to other localities. If all fare restrictions were removed, private companies would have monopolies that would be prejudicial to the public interest.

Mr. R. J. BISHOP (vice-chairman, Walthamstow District Council Tramways Committee) said his Council sat from 7 p.m. to 5 a.m. next morning before it decided to abolish halfpenny fares, but the step had proved a thorough success, and had been the means of turning a deficit into a profit. It set an example which had been followed throughout the London area.

Mr. W. MURRAY (general manager, Walthamstow) said that their experience of car meters to check the consumption of electrical current had been very successful, and had been the means of saving thousands of pounds.

Coun. DAN IRVING (vice-chairman, Burnley Corporation Tramways) said that anyone who had listened to the discussion would be justified in assuming that they were an association of privately-owned tramway companies, the sole object of their existence being the making of profits for shareholders. The principle of municipal ownership was public utility, without thought of profit. Public utility was altogether superior to profit, or ought to be so, and he thought the time would come when tramways would be free to all who required to use them, just as roads and bridges, over which a toll had once to be paid, were now free to the public.

Mr. W. G. T. GOODMAN, at the request of the President, gave an interesting statement on tramway matters in South Australia. There, he said, they had not adopted workmen's fares, but they had special fares for children, and they found that it brought traffic from other sources. On the question of power consumption, it would be impracticable to adopt car meters as, owing to labour conditions, they often had to change their car crews seven times a day. They had a properly constituted authority to settle matters in dispute between employers and employed, and the system worked very well, as it relieved the management of a great deal of responsibility. If, however, there was an authority to fix wages, there ought also to be one to fix fares in accordance with the increased expenses.

Coun. FRYER (Birmingham) said there was danger in the suggestion that a tramways committee should be regarded as separate and distinct from other municipal undertakings. It was an integral part of the municipal organisation, and he disliked the term "trading departments" when they performed a great public service. If a tramway undertaking, maintained on a sound and stable financial basis, with its management properly remunerated, and its employees working under decent conditions, made profits, then it was assuredly worth while to deflect some of those profits to helping on the prosperity of the town.

THE PRESIDENT defended workmen's fare traffic, which he considered to be very profitable, and said that at Burnley they found no difficulty in differentiating between those who were entitled to reduced fares and those who were not. Parcels traffic was highly profitable—75 per cent. of the receipts were profits—if it was properly managed.

Mr. HOLFORD, in replying to the discussion, said the question of finance was one over which the tramway committees had little control. The local authorities were seeking increased representation on the Board of Trade Committee on Electricity Supply. He did not think they were out to make profits, but they wished to avoid losses, and if profits were made on tramways he did not care how they were applied, so long as the systems were maintained in a sound financial condition. He thought it would be a long time before tramways became free, and, personally, he would not like to have

to manage such a system. He thought free food and free water ought to precede free travelling.

The Rule of the Footpath.

Mr. J. DALRYMPLE (general manager, Glasgow Corporation Tramways), who should have opened a discussion on "The Rule of the Footpath," was unable to be present owing to the Royal visit to the Clyde, and his notes on the subject were read by Bailie MONTGOMERY. The point raised was as to whether or not it was time that the rule of the road regarding pedestrians to "keep to the right" should be altered so as to be the same as for vehicular traffic, "keep to the left." From a tramway point of view, it was an important question, as uniformity would tend to prevent confusion, and so avoid accidents. Of 87 tramway authorities circularised, however, 39 had not given the matter consideration, 15 had come to no decision, and a like number had expressed approval. In one case the change had been made, and only three had put forward objections.

Coun. T. CANBY (vice-chairman, Huddersfield Tramways) said his Council had discussed the matter, but felt that it was more of a national than a local one. If adopted, however, it would be of great benefit.

Mr. H. E. BLAIN (London General Omnibus Co.) said this was a matter of much greater importance to traction people than they might imagine. In the Metropolitan area they had 46,000 street accidents in a year, of which 800 were fatal. When he joined his company the accident record and the amount paid in claims were phenomenal, but at the end of four years they had reduced their claims costs by £50,000 per year. In analysing the claims, it was found that if the rule of the footpath had been reversed three-fourths of the fatal accidents could have been avoided. In the London district 38 authorities were in favour of the change, and only eight against. Mr. Blain also referred to the success of the "safety first" campaign.

Sir J. W. COURTIS (chairman, Cardiff Corporation Tramways) suggested that the Home Office should be approached by a deputation on the matter, and this was supported by Mr. A. H. SCOTT, J.P., L.C.C., and Ald. SPENCER, Halifax. Other speakers, however, pointed out that the present rules of the road were largely ignored both by pedestrians and by drivers of vehicles.

It was decided that the Home Office and the various local authorities should be communicated with on the subject.

Differentiation in Fares.

Mr. W. MURRAY (general manager, Walthamstow) then presented his paper on "Differentiation in Fares," which was reported last week.

Coun. J. MOON (deputy-chairman, Plymouth Corporation Tramways Committee), who opened the discussion, said he thought the present concessions were largely the result of weak-kneed management in the past. If concessions had to be made to workmen, blind people, &c., by tramway committees, then other committees should do the same. Tramways were business undertakings, and not philanthropic undertakings.

Ald. BROADLEY (Halifax) contended that workmen's cars paid, and said that if they could have the same loads throughout the day they could afford to run at workmen's fares.

Mr. W. J. MCCOMBE (tramway manager, Hull) said they carried the workman there two miles and seven-eighths for a halfpenny, and the traffic was a profitable one, but this was a question which every municipality must decide for itself, having regard to its own conditions.

Mr. WM. CLOUGH (general manager, Bury Corporation Tramways) pointed out that Mr. Murray, in instancing the success of a halfpenny fare over the High Level Bridge at Newcastle, did not mention that this was a case where it was as cheap to ride as to walk, as, though the distance was only a quarter of a mile, every foot passenger had to pay a halfpenny toll.

Mr. A. ELLIS (Cardiff) said that owing to the whole of their industries centring at the docks, workmen's cars, at four and four and a half miles for a penny, were a distinct loss, as the cars had to run back empty, whilst in the evening, at the busiest time, they had to put aside 33 cars for the purpose of taking the men home again, with the result that often people who would have paid 2½d. for the journey had to walk.

Mr. R. J. BISHOP (vice-chairman, Walthamstow) said their cars were running practically empty from 10 a.m. to 5 p.m., and he did not think that Mr. Murray should have saddled the whole cost upon the workmen's cars. The probability was that if the workmen's cars were taken alone it would be found that they paid.

Mr. P. FISHER (general manager, Dundee) spoke of the great success of cheap fares there, where the maximum was one penny, but Mr. W. J. SCOTT'S (vice-chairman, L.C.C.) said he did not think the halfpenny fare would come back in London.

Mr. MURRAY, in reply, said he was satisfied that workmen's fares were not of much use, and that since they had abolished halfpenny fares and increased workmen's fares by 50 per cent. their traffic receipts had risen fully 4d. per mile.

Mr. ARTHUR ELLIS (Cardiff) read a paper on "The Development of Tramways," but the discussion was adjourned until the following day.

The Development of Tramways.

In opening the discussion on Friday morning, Coun. C. RAINE, J.P. (vice-chairman, Hull Tramways Committee), said that although Mr. Ellis had entered upon the somewhat dangerous sphere of prophecy, he was perfectly justified, for they all recognised that great changes would be made in the future in every phase of life, and probably in none more than tramway traction. The possibilities of development of passenger and goods traffic seemed to be overwhelming. The great difficulty was in joining up the urban and the suburban districts for the benefit of both. A point to which attention might be given was the provision of transit facilities for the people who lived in congested areas off the main thoroughfares of our cities, and who were entitled to have such facilities equally with those who lived on the principal roads. He thought that railless trolley cars might be used here with advantage. The present system, by which they had to go to Parliament when they wished to extend their systems, should be relaxed.

Mr. A. R. FEARNLEY (general manager, Sheffield) suggested that Mr. Ellis held the motor 'bus, as a factor in development of traffic, much too lightly. For the past four and a half years Sheffield had been largely developing rural traffic by motor 'buses, with most satisfactory results, for they had built up a traffic carrying 6,000,000 passengers per annum, with receipts amounting to £40,000. He suggested that there was a great deal to be done in developing the riding habit, seeing that out of a number of towns of which he had details there were only eight in which there was an average of over 200 rides per head of population per annum, whilst there were 58 between 100 and 200, and 37 below 100. Through-running and linking-up of systems were great features in the development of the riding habit.

Mr. N. J. YOUNG (general manager, Newport Tramways) said the time was ripe for the consideration of housing, town-planning, and tramway development as part of one combined scheme, and he thought there ought to be some measure of national assistance in the matter. Why should not Great Britain be divided into representative districts, worked under Government control, and grants be made to assist tramways extension where necessary?

Ald. W. C. FENTON (vice-chairman, Sheffield) objected to the idea, as tramways were a local, not a national, question, and Government control might mean interference with local authorities as to where extensions should take place. He believed in the American idea, that the provision of tramways made for population, and he advocated a bold policy in this matter.

Mr. A. BAKER (general manager, Birmingham) said the present method of Parliamentary control over the schemes of local authorities regarding tramways was simply monstrous. If a Council wished to extend its system in its own area it should have the power to do so, and though some form of control might be necessary where the interests of two or more authorities were concerned, some less costly procedure than the present one ought to be possible.

Ald. SPENCER (Halifax) referred to the question of goods traffic by trams as being one of vital importance, both from a departmental and from a national point of view. He instanced the case of a company with which he was connected, and which had made arrangements with the Leeds Corporation Tramways Committee for the carriage of the raw material in the industry from its source to the manufactory. Of 100 horse-carts and wagons, 80 had been taken off the roads, and the Leeds Corporation would be carrying goods to the extent of 50,000 tons per annum by the end of the year. It had paid his company, and he believed it had paid the Leeds Corporation. The development of this idea would prove of great national value. As to railways, he believed their great extension in the future would be towards electrification.

Mr. A. H. SCOTT (London) suggested that something very tangible might be done towards the reduction of food prices if municipalities were able to provide facilities for bringing agricultural produce direct from the urban districts to their own public markets.

Mr. ELLIS, in reply to the points raised, pointed out that at Leeds the Corporation Tramways Committee had been able to do much in the way of developing goods traffic for war work through the present system, by which it was only necessary to convince the responsible Minister that the extension was a desirable one in the national interest, for not only permission to be given to go on, but valuable wayleaves and privileges to be obtained. It would be a pity if something of this sort did not continue after the war. In considering the extension of tramways into outlying areas, it was very necessary that something should be done to protect the public against the enhanced value of the land along the route. When there was any suspicion of a tramway being extended the land was bought up, so that future development was retarded by exorbitant prices.

Business Meeting.

The annual business meeting followed, at which the report and balance-sheet were adopted. The President made reference to the loss which the Association had sustained by the deaths of Ald. J. Brodie, J.P. (chairman of the Blackpool Tramways and Electricity Committee), and of Ald. J. Miles, J.P. (chairman of the Bolton Corporation Tramways Committee, and a former vice-president).

Ald. S. FLINT, J.P. (chairman, Leicester Tramways Committee), the Vice-President, was unanimously elected President, and Mr. T. B. GOODYER (manager, Croydon Tramways) was elected Vice-President.

Mr. A. BAKER (Birmingham) and Mr. J. M. McELROY (Manchester) were re-elected members of the Executive Council. For three vacancies for councillors or aldermen there were nominated Ald. Spencer (Halifax), a retiring member, Ald. R. Wood (Stalybridge), Coun. R. Mayne, J.P. (Newcastle), Coun. J. Timpson (Portsmouth), and Ald. W. G. Wylie (South Shields). The three first-named were elected.

Mr. J. F. Simpson (Preston) was re-appointed auditor, and Messrs. E. R. Pickmere (town clerk, Liverpool) and Mr. S. F. James (town clerk, Ilkeston) hon. solicitors.

On the proposition of Mr. Baker, the Association placed on record its appreciation of the valuable services rendered as hon. secretary and treasurer by Mr. C. J. Spencer, of Bradford, who had resigned his office, after five and a half years' successful work, in order to take up duties under the Admiralty. It was decided that Mr. Spencer be elected hon. treasurer.

Mr. A. R. Fearnley (Sheffield) was elected hon. secretary, and was heartily thanked for his services.

The new President, Ald. Flint, moved, and Ald. Wylie (South Shields) seconded, a vote to Mr. Mozley for his services in the chair, and thanks to the Mayor and Corporation of Blackpool for the welcome and facilities given for the conference were heartily accorded on the proposition of Ald. F. A. Dunsford, J.P. (Southampton), seconded by Coun. Fryer (Birmingham). Mr. Charles Furness, Blackpool's borough electrical engineer and tramway manager, fittingly replied. Later the delegates were entertained to luncheon by the Blackpool Tramways Committee. Coun. R. Holt, J.P., the Deputy-Mayor, and chairman of the Committee, presided.

From every point of view the conference was distinctly successful, and the view was expressed that in future, as before the war, it ought to extend over three days in view of the many important tramway questions which call for discussion and decision.

WAR ITEMS.

Glass Order.—In the "London Gazette" for September 21st will be found a copy of the Glass and Glassware Order of the Ministry of Munitions, prohibiting the manufacture, supply, or delivery of any chemical or electric lamp glass, &c., except under specified conditions. Full explanatory notes are given.

The Cockerill Works.—"Les Nouvelles," of Maastricht, states that the Germans are completely destroying the Cockerill ironworks at Seraing-sur-Meuse. The iron girders have been removed, and all the blast furnaces are being blown up.—*Times*.

War-time Wages in Germany.—The "Labour Gazette" in an article on "The Course of Industrial Wages in Germany during the War," gives the following figures relating to wages in the metal, engineering, electrical, chemical, and pottery groups of industries:—

Trade group.	Average earnings per day.					
	Men.			Women.		
	March, 1914.	Sept., 1916.	Inc. %	March, 1914.	Sept., 1916.	Inc. %
Metal.. ..	s. d.	s. d.		s. d.	s. d.	
Engineering ..	5 5	7 11	44.5	2 0	4 0	99.5
Electrical ..	5 3	7 11	48.0	2 3	3 10	70.2
Chemical ..	4 5	7 4	64.6	2 8	4 9	74.5
Stoneworking and pottery	5 1	6 9	34.2	2 4	3 6	50.4
	4 5	5 4	21.3	1 8	2 2	31.1

Owing to the limited number of industrial concerns covered by the inquiry, as well as to disturbing influences resulting from war conditions, the German Department of Labour Statistics are of opinion that any conclusions drawn from the foregoing figures as to the movement of the level of wages in German industry during the war must necessarily be subject to certain reservations. No reference is made in the source to the question as to how far increased earnings may be due to the working of overtime.

Protected Trades Certificates.—At Bermondsey, attention was again drawn to the indiscriminate granting of certificates under the Protected Trades Schedule, when a warehouseman, employed by a firm of Lancashire cotton waste manufacturers, stated he had received a certificate, although no application was made for it either by his manager in London or by himself. It was sent to him from Lancashire. The Military Representative said he had to draw attention to the granting of four certificates under the Trade Protection Schedule. Three men were described as unskilled labourers, two 20 years old, both single men, and the other 28 years old, whilst the fourth was an unskilled millhand, 18 years old, all having obtained certificates. Coun. W. Shearring said the granting of these certificates in this indiscriminate way was most unfair to traders and large em-

ployers of labour, and also to the Tribunal, who were called upon to send married men with large families into the Army. The Military Representative said if a firm was on the Government list they automatically received protection cards for all their employes over 19 years of age classified B1 (garrison duty abroad), or in the lower medical categories, no matter what the men did. The Tribunal decided to ask the Badges and Protected Trades Department to receive a deputation on the question within the next fortnight. If no reply was received or a satisfactory solution arrived at in the meantime, the Tribunal decided that they would suspend the hearing of all further applications for exemption.

Municipal Tramwaymen in the War.—A return submitted to the members of the Municipal Tramways Association, at their meeting last week, showed that of 84 municipal authorities replying to the queries, the number of tramway employes at normal times was 55,208, and that 29,268, representing a percentage of 53, had joined the Forces. The amount paid to dependents of employes serving with the Forces totalled £1,437,603, or an average allowance per man of 11s. 4½d. per week. The amount collected on the cars for various national and other objects was £81,509, and tramway employes had contributed £38,170 to various relief funds. On 76 systems women conductors were employed, the number totalling 11,757, and on 18 systems there were women drivers numbering 611. Twenty-six undertakings employed auxiliary drivers, male, these totalling 564.

A French Advisory Council.—According to the "Board of Trade Journal," there has just been published in a French journal the text of a Presidential Decree of September 9th, creating a Conseil Supérieur des Travaux Publics ("Superior Council of Public Works") to examine and advise on the chief technical, economic, and financial questions coming within the province of the Ministry of Public Works (Under-Secretariat of State for Transports). The Council is to consist of (1) the members of the existing Conseil Général des Ponts et Chaussées; (2) members of Parliament and of certain important public and quasi-public administrative bodies; and (3) 21 members appointed by the Minister of Public Works from professional associations concerned in the execution and the development of public works. The Council is to be divided into four sections, of which the first will deal with matters relating to roads, traffic regulation, motor vehicles, and the distribution of electric energy; the second will deal with questions affecting navigation, the management and utilisation of water and water-power (floods, hydraulic works, &c.); the third, with matters relating to ports (works, the regulation of harbours and lighthouses, the provision of buoys and beacons, and coast erosions); and the fourth with matters affecting railways.

After the War.—Dr. Addison, Minister of Reconstruction, addressing a meeting at Huddersfield, said that whatever steps were taken to deal with the problems of reconstruction, we must rely in the main on people helping themselves. The Germans had been busy at the work of reconstruction for some time, and they had been endeavouring in different parts of the world to secure the supply of raw materials that our people would need. They were still making extensive efforts to acquire control of great mineral deposits. They had even tried to buy them in England during the war! Dr. Addison said that the unemployment problem ought not to be so formidable as it looked, but we must prepare to cope with the difficulties that might arise. Over a million men who were fighting would have their places kept open; another large class would be immediately required on shipbuilding and the railways at home and abroad. There would be big demands in many trades, but the provision of raw materials was essential. Shortage of ships had aggravated the shortage of some materials. The more the traders did for themselves to remedy this the better he would be pleased, and he proposed to consult the traders themselves as to how best to do it. It was of great national importance that the manufacturers should overcome their differences and co-operate. The Government had had as one of their chief difficulties the securing of such co-operation. In the past we had not made enough use of brains. Highly trained scientific men who had overcome the difficulties of supplying our armies, had in the past been paid salaries which were a disgrace. Increased productivity was the only way to overcome war's devastation. To secure such increased productivity we needed:—Co-operation between Capital and Labour; better conditions of life; better training; and better industrial methods. One of the chief reasons why Germany had invaded our markets was by organisation in buying and in selling; we must do the same. As a result of his examination of the results in factories where efficiency prevailed, he was able to mention one case where although wages had increased by 20 per cent., production costs had fallen by 20 per cent.

Mr. G. H. Roberts, Minister of Labour, speaking in London on Sunday, referred to plans for the return of soldiers to civil life. He recognised that public opinion would not tolerate procrastination in this matter. The men were recruited for the duration of the war, and they were formulating plans for carrying out that undertaking; but, of course, it would take some time. They might have to enjoin patience, but everything practicable would be done to expedite demobili-

sation. The men for whom situations were waiting would be returned earliest. Every man would have a month's holiday with full pay and full allowances. The men would have the right of unemployment benefit at the rate of at least 10s. per week. They were going to increase the number of Labour Exchanges and extend their functions. In regard to munition workers, the plans were not so complete, but they would be dealt with on very similar lines.

To be Wound Up.—The following company is to be wound up under the Trading with the Enemy Amendment Act, 1916 :—

The Chicago Raw Hide Co., Ltd., Hythe Road, Willesden, London, N.W., machine belting manufacturers. Controller. A. P. Ford, 41, Frederick's Place, Old Jewry, London, E.C.

Exemption Applications.—At the Marylebone Tribunal, Mr. V. J. Malton, aged 29, married, C.2, electrical contractor, of St. John's Wood, applied for further extension. He had been given four weeks' extension to enable him to find work of national importance, but, being offered as a substitute, had refused to take a job because he was offered 9½d. an hour instead of 1s. 1d., the Trade Union rate. The Military Representative said that Malton would be an exceedingly useful man in the Army. The Tribunal thought the man would have been wise to accept 9½d. The Army wanted men who could do the work that he could do. The application was refused.

Bexhill-on-Sea Tribunal, after a review, has granted six months' conditional exemption to W. H. Wakefield (38, B.3), clerk at the Corporation electric light works.

The Hull Tribunal has granted exemption until January 1st to a brake adjuster appealed for by the Corporation tramway department. The man is the only adjuster left for 100 cars.

At Lewes, on a review, conditional exemption held by a shift engineer (26, Class A) at the electric light works was cancelled, and three months substituted. The man stated that he joined the Army two years ago, but was sent back to civil work.

At Buxton, an electrical engineer who appealed stated that he was in poor health, and would break down if he had to join up. He was exempted until March 13th. Similar time was given to two other electricians, and a third had his appeal respite for a month to enable him to secure a Trade Protection Certificate.

Before the West Kent Appeal Court, renewed exemption was sought by F. Butcher (34), electrician, of Bexley Heath. The appeal was dismissed, and time to enable him to wind up his business affairs was refused.

At Deptford, four months' exemption was allowed to E. Brown (39), who is in sole charge of the electrical machinery at a local cattle food works.

At Brighton, a firm of electrical engineers, appealing for an electrician (39, B.2), stated that he was the only man left out of a staff of 18. He was employed on hospital and Government work, and the absolutely necessary installations for business people. Three months were conceded.

At Folkestone, a review was made of the case of A. H. Jenkins (31), chief clerk to the Electricity Supply Co., Ltd. Col. Daniel said that a suitable substitute in the person of a clerk from a bank had been found, but the company would not accept him. The substitution authorities considered that the substitute could have been given a month's trial. On behalf of the company, it was stated that the man sent as a substitute was not fitted for this particular work, and was evidently inefficient. Exemption was continued until a suitable substitute is found. The same decision was arrived at in the case of Mr. Dixon (21), switchboard attendant. In this instance, the substitute offered was 48 years of age, and had left the Twickenham sub-station on the ground of ill-health, and was not fit for any position needing experience and initiative. Other substitutes refused were a man recommended for direct-current work only, and a telephone fitter and jobbing electrician.

Dartford Rural Tribunal has granted six months' exemption to F. H. Luff (30), electrician, of Stone.

At Tring, the Grand Junction Canal Co. applied for exemption for J. Mead (24, Class A), charge hand of the electrical plant at Tring Ford. Exemption until October 7th was allowed.

At Bath, Military appeals were made against E. J. Cooke (35, C.1), electric tram driver, and H. Shrubsole (32, Class A), fitter and spare driver, employed by the Electric Tramways Co. The manager said that Shrubsole, although an inspector, had been doing fitting, &c., owing to the number of men released for the Army. In the case of Cooke, conditional exemption was continued, and in respect of Shrubsole the appeal was allowed, and the certificate of exemption cancelled.

At Southwark, Messrs. Hutton & Hodgson, electrical engineers, applied for the further exemption of F. W. Hutton, son of one of the principals, 26 years old, fit for garrison duty at home (C.1). He was described as an engineer, but Mr. Hutton, sen., claimed that his son was in a certified occupation, as he was a tool setter, having served his apprenticeship to tool making and setting. He was solely employed now on this work. He was granted conditional exemption as being in a certified occupation, on condition that his indentures of apprenticeship were produced for inspection.

BUSINESS NOTES.

The Trade of Guatemala.—The U.S. Consul in Guatemala reports that in manufactures of iron, copper, tin, and lead, and their compounds, the United States supplied during 1916 over 93 per cent. of the import trade, the increase in electrical goods more than equalling Germany's loss; but, he adds, after the war American manufacturers may have to meet vigorous competition in these lines, especially as Germans control the largest electrical installation in Guatemala, and their concession is practically a monopoly. The further development of electric lighting and power in small units on the larger coffee, cane, and other plantations, offers an opportunity that can be safely sought. "Ninety-five per cent. of Guatemala's industrial and agricultural machinery was imported from the United States in 1916. There is a decided preference for American industrial machinery, but as the country is purely agricultural there is little demand for other than repair machinery and small power plants for sawing lumber and cleaning coffee. As the most progressive 'finca's' or plantations are owned or managed by Germans, machinery of German make was preferred before the war. This handicap has been largely overcome, and, with careful handling, the trade can be held by the United States. All the railway material imported in 1916 was of American manufacture, as the railroads of Guatemala are owned by American capital. Other lines are projected, and the market for their supplies will be competitive."

Electrical Affairs in Jamaica.—According to an American Consular report, American manufacturers furnish most of the electrical supplies and equipment used in Jamaica. The imports are grouped separately under two headings, as follows :—(1) Apparatus necessary for generating, storing, conducting, converting into power or light, and measuring electricity; and (2) telegraph and telephonic wire and apparatus. The imports of both groups fall under the list of articles admitted duty free. During 1914 the imports of the first group amounted to £10,250, and in 1915 to £6,804, and the second group to £1,393 and £1,318 respectively. The reason why American equipment represents a large percentage of the imports is that in many instances the original installations consisted of American equipment. In Port Antonio district, embracing the parishes of Portland and St. Mary, there is one electric light plant and one telephone exchange, both located in Port Antonio. Both plants are relatively small, but well equipped. The Port Antonio Electric Light Co. has a capacity of 190 kW., and furnishes electricity for lighting purposes only at the rate of 1s. per kW. There is no demand for electricity for power purposes. The Port Antonio Telephone Co. has 52 instruments installed in the town. Practically all the supplies required by the local trade are handled by the operating company. In general, the equipment is much the same as that in use in the United States, although somewhat antiquated. This applies particularly to lamps, switches, telephone instruments, &c. Electrical accessories such as irons, fans, vibrators, and cooking utensils have no sale, owing to the fact that the local electric light plant operates at night only.

Trade Inquiries.—RUSSIA.—An engineer at Ekaterinodar, who proposes to open, after the war, an office and dépôt for the sale of machinery, &c., desires to receive catalogues, placards, illustrations, photographs for lectures and for lantern slide advertisements from United Kingdom electrical and engineering firms and works manufacturing electrical goods, &c. Name and address can be obtained from the *Department of Commercial Intelligence, 73, Basinghall Street, E.C. 2 (Reference No. 333).

DENMARK.—A Copenhagen firm which intends to inaugurate a commission business wants to get into touch with United Kingdom manufacturers of electric cable, various kinds of wires and wire rope, brass, copper, chinaware, &c. British goods only are to be dealt in to replace German goods, which are still prominent. Activities will be extended to cover Scandinavia, and eventually Russia. Name and address from the Department*, as above (Reference No. 334).

Auction Sales.—MR. T. H. GRIFFITHS will sell by auction on October 3rd, at Longton, Stoke-on-Trent, the premises, machinery, and effects recently in the occupation of Messrs. Adams Bros., electrical engineers, Longton. For particulars see our advertising pages to-day.

THE ASSETS AUCTION CO. will sell by auction on October 3rd, at 129, Newington Causeway, London, the stock of an electrical goods factor. For particulars see our advertising pages to-day.

France.—Under the style of Société Franco-Américaine Scholak, Varda et Cie, there has been formed in Paris, at 6, Avenue Perrichont, a company with a capital of 52,000 fr., for the manufacture of electrical apparatus.

The Société N. Husehard et Cie., of 10, Rue Nouvelle, Paris, electric suppliers, has been dissolved.

There has just been established at Nanterre (Seine), 18, Route de Cherbourg, a company with a capital of 1,500,000 fr., whose objects are the manufacture of all kinds of electric accumulators and their accessory apparatus.

Bankruptcy Proceedings.—OXLEY, H. H. (otherwise Oliver Huxley), consulting engineer, Ealing.—Trustee released September 11th.

Liquidation.—COLSTON ELECTRICAL WORKS, LTD., Bristol.—Liquidator (C. H. King) released September 14th.

Trade Announcements.—MESSRS. L. W. WILD & E. P. BARFIELD have disposed of their rights governing the Wild-Barfield process of steel hardening to Automatic and Electric Furnaces, of 6, Old Queen Street, Westminster, S.W. 1, who are manufacturing and installing complete equipments (furnaces, quenching apparatus, instruments, &c.) for carrying out precision hardening. Mr. Barfield is managing director. An illustrated booklet has been issued describing the equipment.

MESSRS. CREED & CO., LTD., announce that by the mutual agreement of the parties concerned, the arrangements for the acquisition by them of the wireless interests of the Indo-European Telegraph Co. and of the printing telegraph business belonging to Mr. Donald Murray, have been cancelled. The board of Creed and Co., Ltd., now consists of Mr. F. G. Creed (chairman), Mr. W. Arthur Coulson, and Mr. Nicol Paton Brown.

Electrical Trade in the Transvaal.—The Johannesburg Chamber of Commerce, in its review of trade conditions in 1916 in Johannesburg and the Province of the Transvaal, stated that the general feeling in the electrical trade was that, 1916 being the third year of the war, business had been exceptionally well maintained. Indent orders for the heavier electrical goods suffered, but the volume of business was satisfactory, and the increased costs due to manufacturing difficulties, extra freight rates, and insurance had not had an appreciable detrimental effect upon the demand for the smaller lines of electrical machinery, cable and wires, and electrical supplies. The total imports of electrical material into the Union of South Africa, of which about 40 per cent. was shipped to the Transvaal, were £472,287 in 1915 and £715,898 in 1916, divided as follows:—Electric cables and wires, £111,789 and £237,341; electrical fittings, including posts, £182,192 and £298,064; and electrical machinery, £178,306 and £180,493.

These figures include imports from neutral countries. The year was sharply divided into two well-defined periods as regards competition. During the first six months, when there were also considerable stocks available, the competition was quite keen; in the latter portion of the year, with the mining groups once more buying heavily and local stocks becoming gradually depleted, trade was brisk and prices attractive. During 1916, owing to the several causes previously suggested, there was an increase in the price of megohm wires, 30 per cent.; armoured cables, 50 per cent.; and motors, 25 to 30 per cent. There was hardly any difference in the prices quoted for metal filament lamps during 1916, but every indication of a sharp rise in 1917.

Hackney Carbon Contract.—The Hackney Electricity Committee has agreed to relieve the General Electric Co., Ltd., from the obligation of completing the balance of arc lamp carbons due under a contract of 1914, on the condition that the company guarantees to supply the Council with 600 240-volt half-watt type lamps at the list price in force on the date on which delivery may be effected after the removal of the Public Lighting Restrictions, subject to a preferential discount of 28 per cent., and to give such order priority. The company has accepted the condition. The contract for the carbons of different dimensions was at 60s. and 70s. per 1,000 pairs in 1914, but owing to increased cost of material, wages, &c., the ruling prices per 1,000 pairs are now £12 4s. 6d. and £10 respectively, which would mean a very serious loss to the company under the original terms.

Book Notices.—"Tramways and Light Railways Association Journal," September. Contains a copy of the Munitions of War Act, 1917.

Catalogues and Lists.—BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—List No. 2,255 A (eight pages), containing an illustrated description, with tabulated dimensions, of their type DQ continuous-current motors.

MR. GEORGE ELLISON, Wellhead Lane Works, Perry Barr, Birmingham.—Two catalogue lists detailing apparatus recently developed to meet a definite demand; No. 27 (10 pages), gives full description, with illustrations, diagrams, weights and dimensions, and prices in shillings, of disconnectors for A.C. and C.C. circuits up to 750 volts; No. 28 (eight pages) deals similarly with trailing cable sockets and plugs for oil-break gate-end boxes for the same circuits and voltages.

LIGHTING AND POWER NOTES.

Australia.—As terms could not be agreed upon between the Kerang (Vic.) Electric Supply Co. and the local Shire Council for the purchase of the company's electric lighting plant for £5,580, the Council has decided to accept the offer of the Falkner Electric Co. for the supply of a plant at £3,685.—*Tenders.*

Bray (Co. Wicklow).—PRICE INCREASE.—The Council has decided to increase the charge for electrical energy by 10 per cent. to meet the advance in cost of fuel oil.

Bury (Lancs.).—PRICE INCREASE.—The Electricity Committee has decided to advance the charges for electricity for lighting, power, heating, and tramways by the addition of 5 per cent. to each account. The advance comes into operation on October 1st, and the charges will then be 20 per cent. over the pre-war standard for lighting, heating, and tramways and 30 per cent. for power.

Cavan.—The Board of Guardians have communicated with Mr. J. P. Tierney, electrical engineer, Dublin, with regard to the proposed introduction of electric lighting in the workhouse buildings, and the question whether suction gas or oil plant should be used.

Continental.—NORWAY.—The city of Stavanger has decided to take a 10 years' lease of the 12,000 h.p. that is being developed by a private Norwegian company at Florli, on one of the neighbouring fjords, commencing in January, 1918, when the scheme is expected to be in working order. The price is \$12'06 per h.p.-year. Similar leases were effected in 1911, at \$7'50 per h.p., but it is necessary that the municipality should have as much electricity as possible at its disposal, owing to a possible shortage of fuel during the coming winter, as the city's present supply of hydro-electric power is insufficient and the plans for further utilising the available falls which the city owns cannot be carried through for some time. The company's power will be transmitted over very difficult country to the lake where the city's power station is situated, the line being carried on wooden poles straight up over the steep mountain side to a height of about 2,500 ft. above the fjord; one span alone will be a mile long, crossing the Hogsfjord, and saving a distance of 18 miles. The scheme will finally be built for 50,000 volts, but for the present about 30,000 volts will be utilised.—*U.S. Commerce Reports.*

NETHERLANDS.—The increased cost of coal has made it necessary to raise the prices of gas and electricity supplied by the Amsterdam municipal works. Electricity has been supplied, according to the quantity used, at 12 to 15 Dutch cents for light and 8 to 10 for power per kW.-hour. These charges it is now proposed to increase by 5 Dutch cents for light and 1½ cents for power.

Faversham.—PRICE INCREASE.—The T.C. has decided to increase the charges for electricity by ¼d. per unit.

India.—An application has been made to the Madras Government by Messrs. Best & Co., of Madras, for authority to establish an electric lighting and power installation in Madurai, 344 miles from Madras.

Launceston.—PRICE INCREASE.—The T.C. has decided not to oppose the application of the Launceston Electric Supply Co. to the B. of T. for power to charge a maximum of 8d. per unit for the supply of electricity.

Monasterevan (Co. Kildare).—STREET LIGHTING.—The Athy No. 1 District Council has accepted the tender of Mr. R. Griffin for the lighting of this town by electricity, 200-c.p. lamps to be used. A supply of current will be available also for business people and private residents. Hitherto Monasterevan has been lighted by oil lamps.

Morley.—BULK SUPPLY.—Owing to the heavy loss on the Corporation electricity works, several members of the Corporation are of opinion that the time has arrived when the question of purchasing energy in bulk should be considered, instead of generating it as at present.

Newport (I. of W.).—STREET LIGHTING.—The T.C. has accepted the offer of the Electric Light Co. for public lighting until further notice, at a charge of £30 per quarter.

Nuneaton.—PRICE INCREASE.—The T.C. has decided to increase the pre-war charges for electricity by 3¼ per cent. for the quarter commencing September 30th, and to apply for sanction to a loan for money expended on plant, mains, and services.

Oban.—PRICE INCREASE.—The rate for electric lighting has been raised from 7d. to 8d. per unit; for power to ordinary consumers, from 4d. to 4½d. per unit, and to large consumers, from 1½d. to 2½d. per unit; and for heating, from £1 per kW. plus 1d. per unit to £1 per kW. plus 1½d. per unit.

Rochdale.—STREET LIGHTING.—The Electricity Committee is suggesting that the problem of street lighting during the winter shall be partly met by the provision of arc lamps, supplied with current from the tramway overhead wires, on the main tramway routes. In the event of an alarm the lights would be extinguished when the current was switched off from the cars.

Salford.—DOCK EQUIPMENT.—The Manchester Ship Canal Co. proposes to carry out improvements at the Salford Docks, including the putting down of electrical plant for various purposes.

South Africa.—CAPE TOWN EXTENSIONS.—The City Council proposes to erect additional stores, workshops and offices for the E.L. department, at a cost of £16,940, and to install additional plant sufficient for the estimated requirements of the next 25 years, including the electrification of the suburban railway from Cape Town to Simons Town, and the energy required for tramway purposes. The plant that the power station will accommodate, with the alterations and additions now contemplated, it is estimated will deal with a demand of 24,000 kW., being five times the maximum present load. The purchase of the following new plant is recommended:—Additional 3,000-KW. turbo-alternator, £20,000; 1,000-KW. motor-generator for town and dock supply, £5,500; 400-KW. converter for supply of docks, £2,500; one boiler (35,000 lb. of steam per hour), £14,000; one boiler (17,500 lb. of steam per hour), £9,500; steam piping, £2,000; two turbo boiler feed-pumps, £900; wet air filters, £500; extra-high-tension and low-tension switchgear and protective devices, £30,000; additional bank of transformers of 11,000 volts, £2,000; and one of 2,200 volts,

£250; contingencies, £8,460; making a total of £95,610. It is also proposed to spend £68,000 on distribution cables.

JOHANNESBURG: COMPULSORY UNIONISM.—Recently the Amalgamated Society of Engineers notified the T.C. that unless the non-unionists employed at the municipal power station joined the Union or were dismissed, there would be a strike; there were about 200 mechanics employed at the station, of whom all but 14 were members of the Union. The general manager, on the instructions of the Tramway and Lighting Committee, issued a notice calling on all non-union men in the gas and electricity departments to join their respective Unions by July 31st last, or their services would be dispensed with. At a meeting of the T.C., the action of the Committee was discussed, and after a long debate a motion was carried disapproving of the Committee's action, and ordering the immediate withdrawal of the notice. It is reported that the non-union employees have now joined the A.S.E.

DURBAN: YEAR'S WORKING.—At a recent meeting of the Municipal Council, the Mayor (Councillor J. H. Nicolson) said that the electrical department had had another successful year, the revenue totalling £125,000, being £11,000 in excess of the estimates, while it was not likely that the expenditure would be more than the estimated figure, and, after contributing largely to the borough fund and making adequate provision for renewals, sinking fund, &c., a handsome surplus would accrue as a result of the year's working. The units sold would be 22,000,000, as compared with 20,000,000 for the preceding year and 15,000,000 units for the year immediately preceding the war; the figures demonstrated the wisdom of the T.C. in deciding early this year to adopt the borough electrical engineer's recommendation to take steps to increase the power station plant by installing a 3,000-kw. turbine and generator, at an estimated cost of about £20,000, including all accessories. The tender of the British Westinghouse Co. was accepted for this plant, but, unfortunately, the company found they were unable to execute the contract owing to the rapid advance in the cost of materials and labour, and the order was finally placed with the B.T.H. Co. at £14,500, about £150 more than the Westinghouse original price. It was anticipated that the machinery would be installed in such good time that the usual development of the undertaking would not be interfered with.

During the year some difficulty had been experienced in obtaining the necessary supplies on account of the irregularity of shipments, but fortunately last November the present shortage of materials was foreseen by the borough electrical engineer, and heavy stocks of all kinds were bought in, with the result that they were still able to meet all demands both from existing and new customers. For a long time past the only other large municipal electrical undertakings in the country—viz., Johannesburg and Cape Town—had not only had to refuse to make any new connections, but had to restrain customers already connected in their consumption of electricity: one satisfactory aspect of the situation, however, was that the department had been thrown more upon local resources than ever before, and expedients had been adopted bringing into use local productions, which would be of permanent benefit even after the war.

During the year the Council decided to obtain opinions from its consulting electrical engineers in England (Messrs. Merz and McLellan) on a number of points. In the course of their replies, the engineers stated that, in order to arrive annually at the minimum amount which should be set aside out of revenue on account of obsolescence, the following percentages should be taken:—Power station plant, 5 per cent.; power station buildings, 2½ per cent.; underground mains, 1½ per cent.; overhead mains, 2 per cent.; services, nil; sub-station and transformer equipments, 3 per cent.; sub-station buildings, 1½ per cent.; public lighting, electrical instruments and tools, and electric vehicles, nil.

THE RAND.—The chief engineer of the Rand Water Board, in his annual report, states that the policy of shutting down the electrical plant at Swartkoppies and Zuurbekom pumping stations during thunderstorms, as a precautionary measure against damage to the plant and machinery by lightning, has again been followed during the year under review. The plant was shut down on 71 occasions, aggregating a total of 257 hours, and damage to a total amount of £145 was done to the plant. During the previous year the plant was shut down on 100 occasions for a total duration of 230 hours, and damage amounting to £146 was done.

Southend-on-Sea: L.G.B. INQUIRY.—The L.G.B. has informed the T.C. that a local inquiry will be held relative to the application for sanction to a loan of £45,520 for additional generating plant.

Tonbridge: OVERHEAD MAINS.—The U.D.C. has applied to the B. of T. for consent to supply electricity by means of overhead lines outside the present area of supply. The Ministry of Munitions has advanced a loan of £18,130 for electricity extensions.

Walsall: WAR BONUS.—The Committee of Production has decided that the war bonus to male employees of the Corporation gas and electric supply departments shall be increased to 12s. per week for those aged 18 and over, and that in the case of youths and boys under 18 there shall be a further advance of 1s. 6d. a week.

Wharfedale: ELECTRICITY SUPPLY.—At a meeting of the Council, last week, the clerk reported that the Electrical Distribution of Yorkshire, Ltd., was again urging the Council to agree to the company's application for powers for lighting the district. A little while ago the Council was approached, and decided to adopt

a neutral attitude. The clerk had suggested to the Finance Committee that he might meet the company's officers to see whether any new facts could be advanced, and the Council approved of the suggestion.

Willesden: BULK SUPPLY.—The U.D.C. has received a letter from the North Metropolitan Electric Power Supply Co., stating the terms upon which it would be prepared to afford a supply of electricity in bulk for a minimum period of 15 years. The Electricity Committee is not satisfied with the offer, and the company is to be asked to supply energy in bulk for a period of three years from March 31st next at the prices now being paid under the agreement dated March 31st, 1910.

TRAMWAY AND RAILWAY NOTES.

Australia: TRAMWAY STATISTICS.—The progress of electric traction in the Commonwealth during the year 1915-16 is shown in recent figures of transportation issued by the Statistical Branch of the Commonwealth. The advance has been greatest in Victoria, where the mileage route open for traffic increased from 70½ in 1914-15 to 85. Queensland increased its mileage by about two, Western Australia by three, and Tasmania by two miles. The total capital cost of all the systems increased by £926,928, from £12,784,130 to £13,721,058. The energy generated totalled 120,206,835 kw.-hours, compared with 117,127,000 kw.-hours the previous year. The car-miles covered increased from 42,576,000 to 43,335,672; the gross revenue advanced from £2,939,703 to £3,047,736, while the working expenses increased from £2,178,142 to £2,240,611. The number of cars, motors, and trailers increased from 2,120 to 2,165. There are now 13,214 men employed in the service, against 12,223 for the year 1914-15. The total route mileage is 406.

TRAMCAR LIGHTING.—The Melbourne Tramways Board, after investigation of various car-lighting systems over a period of 12 months, has decided to light the cable tramcars by electricity, and tenders have been invited for the equipment of cars, &c., with a storage-battery system, the batteries being charged during the day by dynamos installed at the various car-sheds.

The Prahran and Malvern Tramway Trust reports that the total revenue from passenger fares for the 16 weeks ended June 27th last, amounted to £51,890, car-mileage 869,332, passengers carried 8,009,963, and revenue per car-mile 14'411d.; average operating costs per car-mile 10'619d. The report adds that the equipment of the cars with excess-speed alarms has had the effect of regulating the speed at which cars travel, and of reducing the cost of maintenance of armatures of the electrical equipment.—*Melbourne Age*.

Bradford: WAGES.—The women employees of the Corporation, to the number of 1,400, have applied, through the Council of Municipal Women Employees, for an early revision of the scale of bonus, and ask that the present and any future scale shall apply equally to men and women, contending that the cost of living is as high to women as to men, but that the women's bonus is only 6s. as against the men's 12s. They have secured the support of the local Trades and Labour Council.

Brighouse: WAGES AWARD.—The B. of T. arbitrator's award in a recent application for increased pay by the Corporation employees is not satisfactory to the latter. The award was that the standard rates should stand as they were. Within a fortnight the workers, through their Union, have put in a demand for an increase of 15s. per week. The Corporation, in view of the circumstances, has decided to forward the correspondence to the Chief Industrial Commissioner.

Continental: ITALY.—The Italian Government has made an inspection of the water courses in proximity to the Italian railway lines, and decided that sufficient water power exists for the electrification of numerous lines, thus economising fuel.

Doncaster: WAR BONUS.—The award of the Committee on Production, arbitrating between the Corporation and its employees in all departments in respect of the demand by the latter for an addition of 1s. per day to their wages, grants 4s. per week extra to all men and women over 18 years of age, and 2s. per week to those under that age. Any females whose work brings them under the Munitions Acts are not affected, as they are dealt with under those measures. It is understood that their pay is to be increased to a minimum of 27s. per week.

Edinburgh: NEW TRAMWAY.—The Tramway Committee has had under consideration the proposed electric tramway to Queensferry, and the burgh engineer has been instructed to prepare plans of the proposed routes, and to submit a report to a later meeting of the Committee.

Halifax: FARES.—Tramway fares are again under consideration, a special Sub-Committee having been appointed last week to inquire into and report upon the advisability or otherwise of increasing the fares. The Committee proposed higher fares some time ago, but the T.C. did not agree.

Morecambe.—ELECTRIC TRACTION.—After controversial debates in meetings during several years past, on the subject of the change of the old horse tramway system to some form of mechanical traction (electricity being the most favoured), the T.C. last week, decided in Committee to promote a Bill in Parliament for powers to adopt mechanical traction on the Front and in other parts of the town. In the meantime, as no wholesale transfer from horse to electric power can be made until after the war, the Council further decided to meet present needs by purchasing two electric buses as soon as sanction could be obtained. The vehicles will probably be on the Edison accumulator principle.

Newcastle-on-Tyne.—ELECTRIC VEHICLE.—At a meeting of the Town Improvement Committee of the Corporation, on the 19th inst., it was decided to purchase an electrical wagon for the removal of house refuse, at a cost of £1,123. A statement submitted by the acting city engineer showed that on 41 weeks' working of the present wagon there was a saving of £195 as compared with the cost of horse haulage.

Salford.—YEAR'S WORKING.—The annual report of the Corporation tramways for the year ended March 31st shows gross income 284,443; working expenses, £187,515; allowance to men on service, £16,711; gross profit, £80,217. After deducting payments to local authorities, interest and sinking fund, &c., totalling £79,250, there remains a net profit of £967, which has been carried to the renewals fund. During the year 58,801,870 passengers were carried, an increase of 2,343,604 on 1916; miles run, 5,673,639.

South Lancashire.—FARES.—The South Lancashire Tramways Co., whose system covers about a score of important colliery districts in Southern Lancashire, raised their fares by about 25 per cent., on the average, on Monday. Many hundreds of miners and other colliery workers are affected by the increase.

Venezuela.—La Guaira Harbour Corporation, which owns and operates the Macuto La Guaira-Marquetia Electric Railway, is considering a scheme for developing power from a stream near Galipan. The company's engineer considers that 300 H.P. can be obtained, which will be sufficient to operate the cars and the shops of the electric line and the harbour works.

West Ham.—COMPETITION.—The tramway manager (Mr. Lewis Slattery), in a report, says:—"It is inconceivable why no restriction is placed on competition with tramways; such would not be tolerated with other municipal trading departments. In my opinion, all municipalities should have statutory powers to license and define routes of all competitive services, if such are deemed requisite, and to regulate fares and fix charges for the maintenance of the roads traversed by such services."

TELEGRAPH AND TELEPHONE NOTES.

Canada.—Employés of the G.N.W. Telegraph Co. are striking for equal terms with the Canadian Pacific Co., and 70,000 operators are affected, in offices from the Atlantic to the Pacific.—*Daily Telegraph*.

Postal Servants.—Employés of the Post Office are to present a demand for the raising of their war bonus to 15s. a week for every full-time servant, male or female, and also for its conversion into wages. Up to the present the Post Office Associations have secured war bonuses ranging from 3s. 6d. to 8s.

Wireless Telegraph School.—A school for training wireless operators was opened in Leeds on Monday, in connection with the general campaign for the production of operators for the merchant fleet. It is hoped that Leeds will supply about 200 of them. The school is in an upper storey of premises adjoining the Education Committee's premises. The class numbered 30 at the opening, but further applications are being received daily, and a larger lecture-room is being equipped, containing a complete installation. Mr. R. E. Barnett, head of the Leeds Technical Schools, estimates that the Leeds quota in the present emergency demand will have been supplied to the service in nine months.

CONTRACTS OPEN AND CLOSED.

OPEN.

Kirkcaldy.—October 2nd. Corporation. Converting plant and switchgear. See "Official Notices" September 14th.

CLOSED.

Aylesbury.—U.D.C. Extensions to electricity works: Messrs. Webster & Cannon.

Tonbridge.—U.D.C. :—

Western Electric Co.—Cables.
Bennis & Co.—Stokers, &c.
Willans & Robinson.—Diesel engine and dynamo.
Veritys, Ltd.—Switchboard extensions.

NOTES.

Industrial Development and Research in South Africa.

The honorary committee of scientific and technical men appointed recently by the Government, to advise upon matters concerning the industrial development of the natural resources of the country, of which Mr. Bernard Price is chairman, is taking active measures to ascertain the present extent of knowledge regarding these resources, and to extend and accelerate the work of surveying them. Reports on more than 50 separate subjects have been requested from scientists and others throughout the country, many of whom are Government officials. Advertisements have also been inserted in the public Press, requesting information bearing on the subjects of these reports from all persons who have special knowledge thereon. The reports and data thus obtained will provide a basis on which to initiate further investigation, but without waiting for such information, the committee is already satisfied that an acceleration of certain survey work is urgently needed, and steps are being taken to hasten the completion of the survey of the mineral resources of the country and of water power. In order that the information and data collected by the committee may be widely disseminated for the benefit of the country, and with the object of stimulating industrial development, the committee has recommended to Government that a Journal of Industries should be established. Reports and statistics on various subjects, after publication in this journal, would be abstracted and reprinted in bulletin form, and these bulletins would be obtainable at a nominal price by everyone interested in the subject concerned. The committee is also dealing specially with specific questions referred to it as urgent matters by the Minister of Mines and Industries.—*S.A. Mining Journal*.

Electric Vehicles: A New Zealand Forecast.—The City electrical engineer of Christchurch is reported to have stated that the advent of the storage-battery for vehicular propulsion has opened a new era in that town, where there are already a number of electrically-propelled trucks and vehicles in use. He is of opinion that within five years after the close of the war, the town will have a fleet of five hundred electrically-propelled vehicles.—*Board of Trade Journal*.

Women's Work in Engineering.—There was opened on Wednesday afternoon at the Mappin Art Gallery, Sheffield, by the Lord Mayor of Sheffield, an exhibition of official photographs and samples of women's work in engineering and other industries of munitions of war. The exhibition, which is arranged by the Ministry of Munitions, remains open until October 9th. The collection, which it will be remembered was first exhibited in London and later in several provincial centres, has been considerably enlarged since it was shown at Newcastle. We are sure that our engineering readers in the Sheffield district would find a half-hour or more devoted to a study of these photographs and samples to be time very profitably and educatively spent.

Wages of Central-station Workers.—After considering a report of the proceedings at a Conference held on September 5th at the Ministry of Labour, presided over by Sir George Asquith, between representatives of the Associated Municipal Electrical Engineers (Greater London) and the Electrical Trades Union and the National Union of General Workers, the Hackney Borough Council Electricity Committee reports that there appears to be serious unrest prevailing throughout the electricity undertakings of Greater London at the present time, which is alleged to be mainly due to the delay on the part of various authorities in paying war wages awarded to the shipbuilding and engineering trades by the Committee on Production. "Workmen and junior officers appear to have joined up in the Electrical Trades Union to a very large extent, and this Union, with the National Union of General Workers, is bringing great pressure to bear upon the Ministry of Labour with a view to securing (1) a 48-hour week; (2) increased normal pay equal to what is claimed to be paid in the Post Office, dockyards and other Government works; (3) the Committee on Production's awards in the engineering trades as war wages."

The Committee states that the whole question was carefully considered at a meeting of the Associated Municipal Electrical Engineers (Greater London) held recently, when it was decided that steps should be taken to secure an agreement between the authorities and the Unions as to (a) hours of work, (b) minimum rates of pay, (c) war wages, and that there should as far as possible be uniformity throughout the London area. It was also recommended that each municipal authority in Greater London owning an electricity undertaking should appoint two (municipal) representatives and its chief electrical engineer to form a body which will be authorised (a) to treat with (1) the Electrical Trades Union in respect of uniform payment and conditions for electricians at power stations on the basis of the Union trade-card and in respect of the settlement of the war wages to be added to the wages which may be agreed; (2) the National Union of General Workers (and possibly the Bricklayers' Union and the Workers' Union) for consideration of the wages of the semi-skilled and unskilled men employed at power stations controlled by Councils in the Greater Metropolitan area, having special regard to the possible principle of uniform payments; and (b) to have power to refer points, failing agreement, to conciliation or arbitration.

The Hackney Electricity Committee recommends its Council to appoint two councillors, together with the borough electrical engineer, to act as delegates of and on behalf of the Borough Council upon the proposed body to be formed to treat with employes' representatives.

A Lady Electrician.—According to the *Staffordshire Sentinel*, Miss H. M. Pickston, a lady clerk employed in the chief electrical engineer's office at Stoke, was recently enrolled as the first lady member of the Stoke-on-Trent Engineers' and Engineering Students' Association. Miss Pickston qualified for admission under a recent rule, which requires success in an engineering examination in the case of women applying for membership, by obtaining a pass in the City and Guilds of London Institute examination in electrical engineering.

Calcium Carbide: Ministry of Munitions Order.—The Minister of Munitions has issued an Order taking possession as from September 24th of all calcium carbide in the United Kingdom except individual half-cwt. stocks. Nobody is permitted to sell or supply, except for the purpose of carrying out a contract in writing existing at the above date, or enter into any transaction or negotiation in relation to the sale or purchase of calcium carbide situated outside the United Kingdom, except under special Permit. Monthly returns have to be given of all calcium carbide held by them on the last day of the preceding month, of all purchased or sold by them for future delivery, and all calcium carbide delivered to them during the preceding month. No return is required where the stocks do not exceed half-cwt. Returns have to be sent and applications made, to The Controller of Non-Ferrous Materials Supply, AM2/H, Hotel Victoria, Northumberland Avenue, London, W.C.2.

Electric Vehicles in Siam.—Mr. J. L. Hansen, of the Siam Electricity Co. of Bangkok, Siam, on a visit to the United States, informed the National Electric Light Association that his company had a fleet of five electric vehicles, two of which had been in use since 1901. These 13-year-old veterans are used for lamp delivery, while the larger trucks are used by wiremen, and for various other purposes. They are successfully operated by un-

Russian Grant for Coal-Saving Electric Plant.—At a recent meeting of the Russian Provisional Government, a proposal of the Ministry of Ways and Communication was approved, granting 32,000,000 roubles for the construction of plant for using the water power of the River Volchoff. The installation of an electrical plant on the Volchoff will make it possible to economise 10,000,000 poods of coal a year, by which quantity the national trade balance will be improved.

American Copper Prices.—The *Daily Telegraph* correspondent in New York states that the agreement reached between the producers and the Government fixes the price of copper for the next four months at 23½ cents per lb., this price to be available to the United States and the Allied Governments and the public alike. "It is stipulated further that the producers will not reduce the wages of the miners, that they pledge themselves to maintain the maximum production, and prevent copper falling into the hands of speculators. Copper at 23½ cents is 3 cents below the existing market, more than 10 cents per lb. under the prevailing prices when the Government first undertook to fix the price, and about 10 cents above the pre-war average price. Generally speaking, the price is considered to be a fairly workable one, especially for large producers. Above all, the terms of the announcement indicate that the Government does not intend to reduce prices indiscriminately, but will endeavour to secure satisfactory agreements with the producers of raw materials, rather than enforce arbitrary price reductions by legal or administrative action."

Industry and Education.—A meeting will be held at the Institution of Civil Engineers on October 25th, at 3.30 p.m., for the purpose of considering the establishment of a central organisation for improvement in, and better co-ordination of, engineering training and the appointment of a representative Committee of engineering and educational interests to initiate action. Sir Maurice Fitzmaurice, C.M.G., president of the Institution of Civil Engineers, will preside, and representative engineers and educationalists have signified their intention to be present. Those interested are requested to obtain invitations from Mr. A. P. M. Fleming, British Westinghouse Co., Trafford Park, Manchester, or Mr. A. E. Berriman, chief engineer, Daimler Co., Coventry, who are acting as honorary organisers for the Committee responsible for arranging this meeting.

Engineering is one of England's most important staple industries, and it is of the greatest national consequence that all who are engaged therein from bottom to top should be representative of their highest respective types; this can only be secured when the proper purpose and value of education are not only recognised, but achieved, in the widest sense of the term.

Although engineering training has made great strides in the last 20 years, largely owing to the growth of provincial Universities and technical schools, and to the good influence of some of the more important engineering Institutions, it is a fact that the link between industry and education is not forged as closely as it should be in the interests of the State, and a strong nucleus of opinion has grown in favour of forming a central organisation for the purpose of promoting co-ordination as the best means to secure the improvement that is desired.

Household Coal.—All registered coal merchants in the metropolitan area have a stock of requisition forms, under the Household Coal Distribution Order, for every kind of house or premises. Application should be made by consumers to their usual merchant for these forms and further explanatory information. Any information which cannot be obtained in this way, can be afforded by the local coal overseer for the district in which the consumer resides. Each local authority in the metropolitan area has appointed a coal overseer, whose address can be obtained from the coal merchants. This address is usually at the Council Offices. It is not necessary that applications for forms and routine information should be addressed to the Metropolitan Coal Distribution Branch of the Coal Mines Department.

A Remarkable Defence.—Our correspondent at Cape Town writes:—"Charged with the theft of a motor from his employers, a respectably-dressed European youth made rather a remarkable defence. He explained to the magistrate that the motor used to catch fire when switched on, and a friend of his who was an electrician told him that it was a direct-current motor, and that 'we had turned on the alternating current'; he took the motor home for repairs, and it was now in perfect working order. Accused was reprimanded and discharged. The point is, however, that the building from which the motor was taken has no alternating-current supply, and no evidence appears to have been called as to this."

Sub-Station Attendants.—The twelfth course at the Northampton Polytechnic Institute for giving a preliminary training to disabled sailors and soldiers as sub-station attendants has just been completed, and a number of the men are awaiting vacancies. Engineers of supply undertakings having vacancies are invited to communicate immediately with Dr. R. M. Walmsley, Principal of the Northampton Polytechnic Institute, Clerkenwell, London, E.C. 1.

THE SIAM ELECTRICITY COMPANY'S ELECTRIC VEHICLES.

skilled natives, and are found to be as economical a means of transportation in Siam as they are in this country. This electricity supply company is especially interesting, since it is not dependent on coal as fuel, but uses rice husks in its place, which is obtainable in almost unlimited quantities at a small cost. To provide against a shortage of rice husks the company keeps an oil tank for reserve fuel, but it is rarely needed.

Electro-Harmonic Society.—The first smoking concert for the 1917-18 session of this Society is to be held on October 12th, at 8 p.m. The concerts are to take place in the Venetian Chamber of the Holborn Restaurant, on Fridays, as follows:—

October 12th. Smoking concert.
November 16th. Ladies' night.
December 11th. Smoking concert.
January 11th, 1918. Smoking concert.
February 15th. Ladies' night.
March 15th. Smoking concert.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel Clay, V.D., commanding:—

Officer for the Week.—Lieut. W. J. A. Watkins.

Monday, October 1st.—Drill and Elementary Bridge Construction for No. 3 Company, Right Half Company, 6.30. Signalling Class, 6.30. Recruits' Drill, 6.30.

Tuesday, October 2nd.—Physical drill and bayonet fighting, 7.30.

Wednesday, October 3rd.—Drill and Elementary Bridge Construction for No. 1 Company, 6.30.

Thursday, October 4th.—Drill and Elementary Bridge Construction for No. 2 Company, 6. Signalling Class, 6.30. Ambulance Class, 6.30.

Friday, October 5th.—Drill and Elementary Bridge Construction for No. 3 Company, Left Half Company, 6.30. Recruits' Drill, 6.30.

Saturday, October 6th.—Commandant's Parade for Route March and Drill. Parade at Headquarters, 2.15 p.m. Uniform. Recruits' drill, 2.30, with Corps Parade for Route March.

Musketry.—The Range at Belvedere Road will be open on Tuesdays, Wednesdays, and Thursdays, every evening between 5.30 and 7 p.m. All N.C.O.'s and men who have signed the "A" and "B" agreements are required to attend during this month to re-classify in order to enable the Corps to obtain the Capitulation Grant. Preference will be given to those N.C.O.'s and men in firing. This does not apply to those who hold the proficiency badge.

By order: MACLEOD YEARSLEY, Capt. and Adjutant.

Russian Prices for Electrical Energy: Increase Authorised.—The Board of the Russian Electricity Department has prepared a project for varying the conditions for the delivery of electric current by central stations for public use, owing to the increased cost of raw materials, &c. Central stations, both private and municipal, are authorised to increase their prices according to a scale and conditions published along with this announcement. A certain proportion of increased profits consequent on this widening of price limits is to go to the Government.

Hydro-Electric Power in New Zealand.—The development of hydro-electric power was discussed by Mr. E. Parry, chief electrical engineer to the Public Works Department, at a Conference of the Council of Agriculture at Wellington. He held that the cost of any system of electric power distribution would be recovered within four or five years. In other words, the coal saved would be sufficient in that time to pay for the establishment of the plant. He supported his statements by showing what was being done on the Lake Coleridge system as applied to rural requirements for light and power, and said that this was only an example on a limited scale of what should, and he believed would, apply to the whole of the Dominion. He did not mean that less coal would require to be mined. On the contrary, the demand would be increased, and the collieries would be much more readily developed. Low-grade, refuse coal could be gasified at low expense, and so used through the agency of electricity. From peat, ammonia and oils could be extracted in connection with a system of electrical distribution. With a general system of electricity supply it would be a simple matter to develop and utilise the smaller and more uncertain water courses. With respect to electricity in agriculture, Mr. Parry showed that production could be greatly increased. Its application already had proved a paying proposition for the Government in the Taitapu district. In fact, the country was a better customer for electricity than the town, applying it to so many and various purposes, apart from lighting. Electricity as a motive power for all farm purposes was undoubtedly suitable. He hoped trials would be made at Lincoln College of electric ploughing. Milk could be sterilised by electricity, although at the moment it was in the nature of an experiment. A trial was being made of checking frost in orchards by electricity, with good prospects.—*Auch. Weekly News.*

An Electrical Canteen.—*La Nature* for September 8th prints some particulars of a type of canteen which is the most original of its kind in France. This electrical canteen has been equipped on most modern lines at the works of M. Citroën, a manufacturer engaged on Government contracts. Everything that can be done by means of electricity is so carried out in this model mess-room. The food is cooked in electric ovens, kept hot on a series of electrically-heated hot tables, and served by waitresses on electrically-driven trolleys.

Electric fans and ozonisers are installed in the dining rooms, thus adding to the comfort of the workpeople. It is claimed that it is possible to serve 2,700 meals in less than half an hour, and by having three sittings some 8,000 breakfasts or dinners can be provided. The kitchen staff numbers only 18 persons. The cost per meal—even with the high prices at present ruling in France—works out at 1.50 franc (say 1s.). Details are not given of the actual electric equipment.

Germany and Raw Materials for After-War Trade.—In its column "Through German Eyes," the *Times*, on August 28th, referred to Germany's discussion of the problem of raw materials in connection with reconstruction schemes, as follows:—"The German industrial and commercial interests are never tired of discussing plans for resuming operations with the utmost possible speed when the war is ended and the blockade is raised. Such discussions are especially lively when German 'peace offensives' are in progress. The Association of German Chambers of Commerce has now published a long resolution on the much-disputed question of the importation and distribution of raw materials. It appears that German traders are all very anxious to escape as soon as possible from Government control, but it is universally recognised, on the other hand, that, owing to the depreciation in the value of the mark, uncontrolled trading with foreign countries will be impossible. There are also disputes between traders who have concluded bargains for the supply of raw materials from foreign countries and traders who want all available supplies to be divided by the State. The compromise recommended by the Chambers of Commerce may be summarised as follows:—The removal of restrictions on trade is of the greatest importance for Germany's international trade. Restrictions upon the importation of raw materials should be confined to measures which are necessary for economising the resources of German shipping and German railways, and for raising the value of the mark. Where restrictions are necessary, they should be applied to any other goods rather than to important raw materials. The State should not attempt to control individual bargains by refusing means of payment, but should do everything possible to facilitate payments by means of foreign loans and credits and foreign money. During the period after the conclusion of peace, during which scarcity of raw materials continues, it is necessary, 'for social reasons,' to distribute raw materials as equally as possible, according to the capacity of particular concerns and the extent of their activities immediately before the war. The various industries should establish their own distribution centres, but these centres should not be given any monopoly of freight space and foreign money; they should 'leave the importation of raw materials as much as possible to free trading'; care must be taken to guard the respective

interests of industry and trade. It is insisted that the compulsory fusions of businesses which have been effected under the Auxiliary Service Law should be abandoned immediately after the end of the war. The Chambers of Commerce are holding out against legislation which would compel employers to take back former employes on their return from the war. They express general approval of the Government proposals for demobilisation, and say that, in particular, it is much better to retain men with the Colours for a maximum period of four months, or until they have obtained definite employment, than to attempt any ambitious scheme of support for the unemployed."

Lighting Restrictions.—At Colne, on Monday, Mr. Alfred George Cooper, the borough electrical engineer, was fined 6s. for a breach of the Restriction of Lighting Order.

Appointments Vacant.—Testing assistant (45s.), for the Islington B.C. Electricity Department; book-keeper and invoice clerk (€110), for the Walthamstow U.D.C. Electricity Department; charge engineer for the North Metropolitan Electric Power Supply Co.'s Power Station, Willesden; general clerk for the Aberdare U.D.C. Electricity and Tramway Department; senior clerk (€160) for the Borough of Salford Electricity Department; switchboard assistant for the Stepney B.C. Electricity Department. See our advertisement pages to-day.

Fleetwood Council proposes to appoint an assistant electrical engineer at €150 per annum, rising to €175 in six months.

Organisation of Power Station Engineers.—We are informed that on Friday last, at a meeting of electric power engineers in the Birmingham district, it was decided that the Midland Electric Power Supply Engineers' Association be formed. It is proposed that the Association shall embrace the whole of the Midlands, and, later, join with similar organisations in other parts of the country. A further meeting will be held at Queen's Chambers, Snow Hill, Birmingham, on Friday, October 5th. Full particulars can be obtained from the hon. sec., Mr. P. J. Burgess, 21, Geraldine Road, South Yardley, Birmingham.

The C.A.V. New Electric Starter.—On Tuesday last a demonstration was given at the works of Messrs. C. A. Vandervell and Co., Ltd., Acon, of their new geared type of electric starter for motor-cars. The starter embodies an ingenious combination of two main principles with which the motor world is familiar—namely, the axial pull upon an armature which is not symmetrically situated with regard to the field magnets, and the use of a pinion working on a screw thread cut on the armature spindle; when the current is switched on, the armature moves axially and draws the pinion into contact with a gear on the fly-wheel, and as the armature revolves the pinion drops into mesh, and moves along the thread until fully meshed, when it is positively driven by the armature, and accelerates the fly-wheel. Directly the engine starts, the fly-wheel overtakes the pinion, and causes it to run back and disengage the gears. The starter is controlled by a plunger switch with two positions; the first starts the motor slowly and engages the gears, and when the plunger is pressed home the full power of the motor is applied. In the first position a momentary "dwell" is caused by a ball, backed by a spring, entering a recess in the spindle of the plunger. The whole operation is automatic and noiseless; the full power of the motor cannot be applied until the gears are fully meshed; no damage can possibly result from backfires, and the disengagement of the pinion when the engine starts is automatic and certain—once the engine is running it is impossible for the gears to remain in mesh. We are informed that the current consumption is extremely low; the starter is very light, strong, and simple, and no adjustment is required. It is made in three sizes, for cars and engines, ranging up to 150 H.P., and judging by the samples which we saw, it is extremely well designed and constructed.

On the same occasion we were privileged to make a tour of Messrs. Vandervell's works, which have been greatly extended, and are occupied with a variety of very important work; the completeness and efficiency of the organisation of the establishment were conspicuous features, and reflected the greatest credit on the staff of the company.

A descriptive pamphlet relating to the new machine appropriately bears the title, "Electric Starters—C.A.V."; as pioneers of the electric lighting of motor-cars in 1900 and of the variable-speed dynamo in 1904, the firm undoubtedly are "electric starters," and we may add that they are making the running and are certain winners.

Patents and Alien Enemies.—A list of some 24 German patents, mainly owned by the firm of Robert Bosch, is given in the *Illustrated Official Journal (Patents)* for September 26th, in respect of which application has been made to the Board of Trade by the British Lighting and Ignition Co., Ltd.

Electric Voting Machine.—The Argentine Government has been inviting tenders for the designing, manufacture, and installation of an electrical voting machine for the Chamber of Deputies of Argentina.

A Swansea Strike.—The *Times* says that a strike of steel workers at Briton Ferry, near Swansea, which arose over the dismissal of a foreman electrician, over 1,000 men being affected, has been settled, the men, after a conference with representatives of the Ministry of Munitions, deciding to resume the matters in dispute to be referred to arbitration.

The Belfast Strike.—When the case of the 32 employes of the Belfast Electricity Department was again before the Belfast Munitions Tribunal on September 18th, it was stated that since the order adjourning the cases was made, the men, in accordance with their undertaking, had returned to work, and there had been no cause of complaint against them since. The President adjourned the case for another six months, to see if they would keep their undertaking. He said he hoped that the men would remember that for the offence they had committed they were liable to heavy penalties, and the question of whether or not those penalties would be imposed would depend largely on how they conducted themselves in the meantime.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The Rochdale Tramways Committee has unanimously recommended that the salary of MR. G. WEBSTER, the general manager, shall be increased from £450 to £500. A return submitted showed that the existing remuneration was below the average paid in towns similar to Rochdale, and warm appreciation of Mr. Webster's services was expressed by members of the Committee.

MR. J. WILKINSON, tramway electrical engineer, Hull, has returned to business after a serious illness of several weeks' duration, and will be glad if his business friends will note his new address:—Tramway Power Station Buildings, Osborne Street, Hull.

MR. J. A. RAYNER, manager, Galway Electric Light Co., has been presented with a gold watch by the employes, and with a smoking cabinet by the Galway Rowing Club, on his leaving for Hereford. His successor in the Galway managership is Mr. Collins, of Dublin.

MR. HAROLD WM. SANDERS, A.M.I.Mech.E., chief draughtsman, Manchester Corporation Electricity Department, has been appointed assistant constructional engineer to the City of Birmingham Electric Supply Department, Dale End, Birmingham.

MR. C. J. TURNER, chief engineer and manager of the Hoylake and West Kirby U.D.C. electricity department, was recently granted a commission as lieutenant, R.N.V.R., and on the occasion of his leaving to take up his duties as electrical officer in the R.N.A.S. he was presented with a case of pipes and a cigarette case by the staff.

General.—MR. JOSEPH FLANAGAN has been appointed electrical engineer to the Tees-Side Bridge and Engineering Works, Ltd., Middlesbrough.

GOLDEN WEDDING.—The many friends of ALD. BRUCE, chairman of the Sunderland Electricity and Lighting Committee, will be pleased to learn that on Monday next, October 1st, he will celebrate his golden wedding, and will join us in congratulating him on that happy occasion. Ald. Bruce was elected a member of the Sunderland Council in 1879, and was elected an Alderman in 1896. He was Mayor of the borough for two years (1897-8), and has been chairman of the Electricity and Lighting Committee since its formation, about 23 years ago (which is probably the longest record for a chairman of an Electricity Committee, unless Ald. Pearson, of Bristol, can claim to beat it). He was a member of the I.M.E.A. Council from 1905 to 1914, when he retired under the new rule that requires a member to retire for at least one year; he is also a director of the Municipal Mutual Insurance Association. Two of his sons are serving in France, both being lance-corporals, and the younger has been awarded the Military Medal. Under his wise guidance the Sunderland undertaking has been developed into a large and prosperous concern, and we trust for many years to come it will have the benefit of his matured experience and sound judgment.

Roll of Honour.—SAPPER ALBERT PENNY, R.E., who has died of wounds, was employed at the Salford Corporation electricity department.

PRIVATE S. D. DALBY, A.S.C., M.T., who has died from appendicitis in South Africa, was employed by Mr. George Newby, electrical engineer, Bradford.

MR. W. J. LARKE, assistant chief engineer at the Rugby Works of the B.T.H. Co., and lately engaged at the Ministry of Munitions, has been appointed an officer of the Order of the British Empire.

PRIVATE CECIL R. GIBBONS, Lancashire Fusiliers, killed in action, aged 20, was employed at the British Westinghouse Works, Trafford Park.

CORPORAL ARTHUR HALLIWELL, R.F.A., who was recently awarded the Military Medal, is in hospital in France, wounded. He was employed by the Lancashire Electric Power Co.

DRUMMER W. KIRKMAN, Royal Welsh Fusiliers, who has died of wounds, aged 32, was employed at the Bolton Corporation electricity works.

PRIVATE THOMAS TURNER, Duke of Wellington's Regiment, who has been killed, was employed at the Phoenix Dynamo Works, Bradford.

On Thursday, last week, at the Ediswan Works, LANCE-CORPORAL W. A. PRIME, of the 11th Batt., Middlesex Regiment, who was formerly employed in the Ediswan glasshouse, stamping and furnishing shops, was presented with an illuminated address, a gold watch, and a sum of money by Mr. J. W. Elliott, on behalf of the staff. Lance-Corporal Prime is only 18 years of age, but

won the Military Medal on February 26th, 1917, and was wounded at Arras on April 10th, losing his right foot.

SECOND LIEUT. WM. H. PALMER, R.F.C., who met his death at Lincoln while flying, owing to the petrol-tank igniting, was an electrical engineer, trained at Finsbury College. He was the only son of Councillor W. H. G. Palmer, of Kingston-on-Thames.

SIGNALLER P. O. MEARS, London Regiment, aged 19, who has been killed in action, was a draughtsman with the Western Electric Co., Ltd., at North Woolwich.

CAPT. R. J. ROONEY, R.E., who was wounded by a bomb at the Front, and whose death has just been announced, was an electrical engineer practising in Scotland.

Obituary.—We regret to learn that Mr. C. M. Dorman, of Whitehall, Brooklands, Cheshire, chairman of Messrs. Dorman and Smith, Ltd., electrical engineers, Salford, has lost his only son, SAPPER HAROLD MARK DORMAN, R.E. Sapper Dorman, who was 19 years of age, and was stationed at Marlow-on-Thames, was accidentally drowned near Boulter's Lock, on September 9th.

The death has taken place, at the age of 64, of MR. WILLIAM ROBSON, of Messrs. Wm. Robson & Sons, electric lighting engineers, of Kirkdale, Liverpool.

The death has occurred of MR. ARCHIBALD WILSON, one of the partners of the firm of Messrs. King & Co., Leith Electric Works, Edinburgh, as the result of an accident on Saturday evening. Mr. Wilson was riding his motor bicycle, and collided with a commercial motor lorry. He joined the firm 26 years ago.

CITY NOTES.

German Companies.

The directors of the *Deutsche Elektrizitäts Werke Garbe, Lahmeyer & Co., of Aix-la-Chapelle*, recommend a dividend of 6 per cent. for 1916-17, this comparing with 5 per cent. in the previous year.

The Kabel Werk Rheymdt, A.G., of Rheymdt, proposes to pay a dividend of 20 per cent. for 1916-17 on share capital of £250,000, as contrasted with 30 per cent. in the preceding year. At the same time the share capital is to be increased to £350,000.

The Internationale Stickstoff A.G., of Wiesbaden, which has had a nominal share capital of £103,000 since reconstruction in 1913, and had a debit balance of £46,000 at the end of 1915, is again to be reorganised by the reduction of the capital to £27,000.

The Hamburgische Elektrizitäts Werke A.G., of Hamburg, reports a large increase in working expenses in 1916-17, and a decline in the net profits from £88,000 in 1915-16 to £52,000 last year. The dividend on the ordinary capital of £1,100,000 is proposed at 3 per cent., as contrasted with 6 per cent. in 1915-16, 11½ per cent. in 1914-15, and 8½ per cent. in 1913-14.

The Fabrik Isolierter Drähte (late C. J. Vogel), of Berlin, has decided to increase the share capital by £112,000 to £375,000, for the purpose of defraying the cost of additional machinery for the new works at Köpenick. The new shares are to be offered to present shareholders at the price of 148 per cent., they having already been taken over firm by a banking syndicate at 140 per cent.

The Akkumulatoren Fabrik A.G., of Berlin and Hagen, reports that the undertaking at Milan has been disposed of, and the value of the other interests in enemy countries has been entered in the accounts for 1916-17 at figures which exclude any risks. After allocating £4,000 to depreciation, as against £3,400 in 1915-16, the net profits are returned at £193,000, as compared with £138,000, permitting of the payment of 25 per cent., as contrasted with a dividend of 20 per cent. in the previous year.

The Isaria Zähler Werke A.G., of Munich, which belongs to the Brown-Boveri group, reports that in addition to the army orders received in 1916-17, the company endeavoured to increase the output of peace products as far as possible, these still forming the greater portion of the production. It was, however, impossible for sale prices of meters to keep pace with the growth in the cost of raw materials and of wages. After setting aside £11,000 for depreciation, as against £6,000 in 1915-16, the accounts show net profits of £24,000, as compared with £21,000. It is proposed to pay a dividend of 12 per cent., as contrasted with 10 per cent. in the preceding year.

Victoria Falls and Transvaal Power Co.

Mr. A. E. HADLEY presided at the annual meeting, held in London last Friday. He said that the net earnings were £70,000 higher than last year, enabling them to pay 5 per cent. on the ordinary shares, and to raise the dividend on the participating preference shares to the full amount to which they could become entitled, namely, 10 per cent. They had transferred from the balance standing to the credit of the profit and loss account as at December last £150,000 to a reserve fund, which was available to meet contingencies that might arise, to improve the property, to equalise dividends, or for any purpose conducive to the interests of the company. For the first time there was a reduction in the amount of the first debentures; the amortisation at the rate of 5 per cent. per annum fixed by the trust deed had now come into operation, and the amount of the first debentures drawn or purchased was £152,100. Dur-

ing the year a further £75,680 of second debentures had been redeemed by purchase. The position with regard to excess profits in the United Kingdom was clearer than last year, the pre-war percentage on capital having meanwhile been settled, and it had not been considered necessary to make any provision under that head in the 1916 accounts. Since the close of the accounts the financial legislation in South Africa had been greatly modified, throwing a heavier burden on the taxpayer. The modifications, while involving a reduction in the rate of the old income-tax, imposed a dividend tax, together with an excess profits duty at the rate of 25 per cent., calculated on the same general principles as adopted by this country. The taxation was retrospective, so as to apply partly to 1916, and a provision had been made to meet the charge in the accounts now submitted. In regard to engineering matters, the station generating plant for electric power and compressed air had run successfully and been well maintained during this period. The overhead transmission and distributing lines, and the consumers' sub-station plant, together with the compressed air pipe line, had been operated satisfactorily, and had been kept in a good state of repair. There had been no extension to the generating or distributing plant, other than a small pole line extension to a new consumer in the Brakpan area, the Sub-Nigel Co., the capacity of the generating plant being 270,680 h.p. The quantity of water for condensing purposes accumulated in the dams at the various generating stations remained normal, and showed no sign of shortage. The supply of engineering spare parts had presented difficulties, owing to the shortage of supply from this country, but this had been overcome in some cases by the increased output from the company's engineering workshops, while the provision of general engineering stores had, in spite of the difficulties of supply, been maintained. The prosperity of the company being so closely interwoven with that of the gold mining industry on the Rand, they had reason to follow with feelings of admiration the successful manner in which, in spite of the difficulties created by the war, the output of gold and the general activity of the mines had been maintained. The extra cost of materials, increased wages, taxation, and fluctuations in the supply of native labour impose heavy burdens both on their consumers and themselves, while neither of them was in a position to raise the price of its product. The foresight and energy displayed by those responsible for the conduct of the mines, assisted by the sympathetic attitude of the Imperial and Union Governments, had enabled these difficulties of obtaining the necessary materials to be overcome, and had prevented the supply of gold from the reef, so essential to the conduct of the war, from falling away. Naturally, these war conditions were reflected in the working costs, and were felt most severely by those mines working low-grade ore; but, nevertheless, by good management these mines had been kept working, and such mines as had been shut down during the period under review had either come to an end of their ore, or had closed through causes normally incidental to mining. The developments in the Far Eastern Rand, where several of their largest consumers were situated, continued to be satisfactory, and during the year the Union Government had leased two further areas in this part of the Rand, both of which were acquired by existing mining houses. The chairman expressed appreciation of the work of the company's staff and their associates.

In replying to shareholders' questions, the chairman said he could not at present make any statement about the prospect of an increased ordinary dividend. The profits for the present year had been going practically the same as last year.

To be Struck Off the Register.—The following companies will be struck off the register in three months unless cause is shown to the contrary:—

Absorbent Engine Cloth Co.
Eastern Electric Co.
Electrical Engineering & Motor Co. (Carlisle).
Marine & General Oil Engines.
Standard Bolt & Nut Co.
Transport Development & Power Syndicate.
Vanadium, Ltd.
X.L. Electric Co.

Stock Exchange Notice.—Application has been made to the Committee to allow the following to be quoted in the Official List:—

Electro-Bleach & By-Products, Ltd.—120,000 ordinary shares of 10s. each, fully-paid, Nos. 1 to 120,000.

Calcutta Electric Supply Corporation, Ltd.—The units sold to consumers during the four weeks ended July 27th were 2,307,315, compared with 2,020,562 in the corresponding four weeks of 1916.

NEW COMPANIES REGISTERED.

Abrasives, Ltd. (148,486).—Private company. Registered September 19th. Capital, £10,000 in £1 shares. To carry on the business of manufacturers and factors of, agents for, and dealers in, metals, emery, emery stone, corundum, abrasives, polishing wheels, and the like, mechanical, electrical, and general engineers, &c. Agreement between J. S. Mitchell and B. R. Rowland & Co., Ltd., of the first part, W. M. Rowland of the second part, and the company of the third part. The subscribers (each with one share) are:—J. S. Mitchell, Hyland, Hargate Drive, Hale, Altrincham, Cheshire, engineer; W. M. Rowland, 24, Lancaster Road, Birk-

dale, Southport, engineer. The first directors are:—J. S. Mitchell and W. M. Rowland. Solicitors: Matthew, Hall & Thomson, 26, Victoria Street, Manchester.

E. O. S. Engine, Ltd. (148,451).—Private company. Registered September 13th. Capital, £1,000 in 41 shares. Mechanical and electrical engineers, &c. The subscribers (each with one share) are:—G. Patteson, Pinners Hall, E.C.2, accountant; T. S. James, 16, Edith Road, Peckham, S.E.15, engineer. The first directors are to be appointed by the subscribers. Solicitors: Francis & Johnson, 19, Great Winchester Street, E.C.2.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Alfred Danks, Ltd.—Memorandum of satisfaction in full on September 3rd, 1917, of mortgage debenture dated May 6th, 1916, securing £6,000 has been filed.

Gorseion Electric Light Co., Ltd. (39,944).—Capital, £10,000 in 41 shares. Return dated August 8th, 1917. 9,350 shares taken up; £2 paid; £9,348 considered as paid. Mortgages and charges: £780.

D. Hulett & Co., Ltd. (29,163).—Capital, £35,000 in 45 shares. Return dated August 8th, 1917. 6,000 shares taken up; £9,500 paid on 1,900; £20,500 considered as paid on 4,100. Mortgages and charges: Nil.

General Electric Co., Ltd. (67,307).—Capital, £1,400,000 in 80,000 pref. and 60,000 ord. shares of £10 each. Return dated July 31st (filed September 6th), 1917. 70,000 pref. and 50,000 ord. shares taken up; £880,000 paid on 63,000 pref. and 25,000 ord.; £320,000 considered as paid on 7,000 pref. and 25,000 ord. Mortgages and charges: £200,000.

STOCKS AND SHARES.

TUESDAY EVENING.

THE City awaits with keen interest the Government's declaration with regard to more borrowing. In some quarters a new popular Loan is considered so imminent as to lead the prophets to look for its issue this week-end. In other directions, it is thought that the Loan may be postponed until after Christmas. The only effect that the discussion exercises upon current prices is in the Consol market, where the tone has softened somewhat. All other investment sections are very hard, while in some markets speculation is boisterously active.

Home Rails are enjoying one of their rare and lucid intervals, with prices firmer, and business more pronounced. The reason seems to be that other domestic investments of sober class are becoming difficult to find, while the Railway stocks of companies operating outside Great Britain are all out of favour for one reason and another. This tends to drive investment money into the Home Railway list, and the Undergrounds receive their due heed of attention. Amongst them, Central London assented stocks are noticed for their yield, and rises of 2 points have lifted the ordinary and the preferred ordinary to 60½. Metropolitan Consolidated advanced to 24½, but reacted to 23½; the company's deferred dividend stock is up 1 to 21. Underground Incomes remain at 82, from which price they will probably advance; the tide of London's traffic reminds one forcibly of the old lady who aroused the concern of the elder Mr. Weller at the famous tea-party.

The electric lighting market is firm, Bromptons holding their rise at 6½, and Metropolitans gaining 5s. at 65s. The demand for debenture stocks and preference shares is perhaps rather less insistent than it was, for which the coming of the new War Loan is doubtless responsible. People want to see what its terms will be before putting much money just at present into gilt-edged securities. But there is no pressure to sell, and the buyers of ordinary shares are as alert as ever for cheap stock. The sleepy special constable wonders where all the London searchlights draw their "juice," as he watches their beams while he is on duty; wonders too, it may be, if readers will forgive a short article as he sits down to it after the "All Clear" releases him for burning midnight oil of his own.

Marconis have developed renewed buoyancy, which arose first in the shares of the Marine Co., taking the price to 54s. before a slight reaction occurred. The parent shares rose to 66s. 3d., Americans to 19s. 3d., and Canadians to half a guinea. Business in Marconis is so spasmodic as to render an observer cautious of saying much about it, but the market view is certainly optimistic.

The telegraph group has no fresh feature this week, business being handicapped by the scarcity of supply of stock obtainable. Telegraph Constructions are 10s. better at 39, and India-Rubbers keep very firm at 13½, shares being wanted at the price. Oriental Telephones have recovered their decline of last week, but United River Plates are still a trifle dullish.

Mexicans tend to halt. The dramatic rise in the price of silver is a bull point. The condition of the country calls for caution in putting money into Mexicans. Amongst the Utilities, Mexico Tramways Fives relapsed 2 points to 4½, but the remainder of the group keeps steady. British Columbia Electric Railway 4½ per cent. debenture stock has gone back to 50. The deferred and preferred issues are lower. Anglo-Argentine Trams are unchanged, the fatal railway strikes not affecting any of the tramway issues. A fair amount of speculative buying keeps Pernambuco Tramways

ordinary shares prominent, the present price being 7s. 3d. The 7 per cent. preference at 13s. and the 5 per cent. first debentures at 68 are firm. These latter look cheaper than the preference, as things stand at present.

British Aluminium shares have come back rather sharply, falling $\frac{1}{2}$ to 32s. in consequence of a good deal of profit-taking. Other members of the miscellaneous group, however, are strong. Electric Constructions rose to 20s.; British Westinghouse Preference put on 5/16 at 3 1/16. British Insulated are strong at 14 $\frac{1}{2}$. Babcock Ordinary advanced to 3 $\frac{1}{4}$ buyers. Victoria Falls & Power shares are very quiet at 19s. 3d. for the ordinary and 23s. 9d. for the preference, the price being unaffected by the meeting at the end of last week. The chairman spoke in a vein of cautious optimism, and his remarks formed an appropriate corollary to the recent report. There has been a little business just lately in the 6 per cent. preference shares of the Madras Electric Supply Corporation, the price being about 17s. 6d. Vera Cruz ordinary are changing hands on the basis of 7s. 6d. Crompton preference at 11s. 3d. are a trifle harder; the ordinary remain in the neighbourhood of 10s. 3d.

The rubber market is animated, with prices strong. A large volume of business is in progress, interfered with to some extent, in the early part of the week, by the moonlight raiders. The price of the material fluctuates a little from day to day, keeping very close to the neighbourhood of 2s. 10d. per lb. More activity has come about in armament shares. Armstrongs and Vickers both being firmer. A good deal of trade, too, is passing in the shares of the companies connected with base metals, those of the tin group being especially prominent.

Handling Coal with an Electric Truck.—Since the first of this year the Canton (Ill.) Gas and Electric Co. has been hauling coal to its electric and gas plants in an electric truck. The results, according to E. H. Negley, secretary and manager of the company, indicate that the investment was a good one, and that a considerable saving in coal-hauling costs is being made.

The haul from the railroad track to the company's electric plant is about three blocks long, and to its gas plant about 1 $\frac{1}{2}$ miles (2 $\frac{1}{2}$ km.). Over this distance this truck makes a round trip to the electric plant in about seven minutes, and can convey the contents of a 50-ton (45 $\frac{1}{2}$ -t.) ear of screenings to the station in about three hours. The round-trip haul to the gas plant requires about 30 minutes.

The speed of the truck loaded is about 7 miles (11 $\frac{1}{3}$ km.) an hour, and in ordinary operation it will cover from 15 to 25 miles (24 km. to 40 km.) a day, depending on how many trips are made. The truck is a Walker Vehicle Co.'s design with 44 cells of 31-plate Philadelphia storage batteries. It is said to be the first electric truck to be equipped with a Lee Loader Co.'s dump body; the dumping feature of this body has demonstrated its value at Canton, since the driver alone through the use of it can unload 10,000 lb. (4,536 kg.) of coal into the hopper in two minutes. The driver, who operates this truck exclusively, is responsible for its entire care, both as to charging and maintenance.—*Electrical World*.

Railway Electrification in South Africa.—In view of the attention which has been devoted of late to the possibility of certain portions of the S.A. Union Railways being electrified, and the general and increasing utility of electrical power, a large gathering assembled at the Durban Technical College on July 27th to hear a lecture on "Railway Electrification," by Mr. J. W. Kirkland, of Johannesburg, arranged by the Engineering Section of the Natal Society for the Advancement of Science and Art. The author told a graphic story of the Chicago, Milwaukee, and St. Paul Railway, which is the most important and largest instance of the application of electricity to railway operation, and which he has recently visited and inspected. He gave a summary of the advantages to be gained by the electrification of main line traffic, and in allusion to the practicability of adopting the system, so far as certain lines in South Africa were concerned, stated that the carrying capacity of the Natal line could be greatly increased by the electrification.—*Natal Mercury*.

ELECTRODES FOR ELECTRIC FURNACES: THEIR MANUFACTURE, PROPERTIES, AND UTILISATION.

(Concluded from page 286.)

Metallic and Compound Electrodes.—The use of vertical—or sole—electrodes of metal, or with a base of metal or secondary conductor, offers greater difficulties than the use of carbon electrodes, but it is essential in certain manufactures which necessitate the exclusion of carbonising materials to as great an extent as possible. On the other hand, it is sometimes desirable to incorporate certain ingredients of the final product with the electrodes to be used in its manufacture. Metallic electrodes facilitate cooling of pieces between which the arc plays; and compound electrodes are used where a conducting or semi-conducting medium is needed for special purposes.

Metallic Electrodes.—Tubular metal electrodes are used in several types of furnaces for the manufacture of nitric acid. In the Schonherr furnace, for instance, one electrode consists of a vertical steel tube of length proportioned to the power of the apparatus. The other electrode is a water-cooled tube of copper. At the centre of the second electrode there is an iron core which may be replaced

FIG. 21.

FIGS. 22 AND 23.

easily; its working life is about 2,000 hours, and replacement occupies only 15 minutes. The arc plays between the tube and the copper electrode.

The Moscicki furnace uses concentric electrodes, the external one being a copper cylinder 15 cm. in diameter, mounted in a clay base. The central electrode is a water-cooled tube 6 cm. in diameter, and

FIG. 24.

FIG. 25.

held at the top in a porcelain support. The arc plays between the two tubes, and is made to rotate by a magnetic device.

In the Birkeland-Eyde furnace the two electrodes are set in line. Each consists of a simple copper tube bent to U shape and water cooled. The electrodes wear very slowly, and are easily accessible and renewable.

Horn electrodes are used in the Guye & Pauling (fig. 21) for the synthetic manufacture of nitric acid. The electrodes E E' are of cast steel, and are made hollow to permit of water circulation. The arc is struck at A, where the electrodes are nearest together, but at once rises and spreads itself between the two horns. An air blast is maintained from m to n, and carries out with it the nitric products made by the action of the arc.

Massive metal electrodes are used in certain furnaces for the manufacture or fusion of metals. Such electrodes are preferably of the same nature as the metal to be melted, e.g., iron electrodes in iron or steel furnaces, and copper electrodes in furnaces handling copper, bronze, or brass. In the simple type of melting furnace, illustrated in fig. 22, a large iron or copper electrode is embedded in packing M of carbon pisé, which forms the working bed of the furnace.

In the Gin "channel and basin" furnace which utilises the

resistance of the molten steel itself, each electrode is formed of a block of soft steel A (fig. 23), terminating in the channel B of metal under treatment. The electrode is let into the refractory body R of the furnace itself, and has a circular cavity of the section shown at m, and through this circulates cold water. The cooling effected is sufficient to keep practically stationary the plane a of transition from the solid to the liquid steel of the same composition. A similar arrangement is employed in the Gired steel furnace, where a steel electrode M (fig. 21) is mounted laterally in the refractory body of the furnace. Fragments of the same grade of metal as it is desired to produce in the furnace are placed at A, and these, after solidification, protect the pole M, which is also water cooled. The space B forms the useful reducing and melting portion of the furnace.

Sole Electrodes.—Metallic bottom electrodes embedded in refractory, non-conducting material may be used in a number of ways differing more or less in detail. One of the first furnaces of this type was brought out by Siemens in 1880; two vertical electrodes were used, the upper one being of carbon and the lower one an iron rod fed forward by a screw mechanism in proportion to its consumption. In the Borchers furnace (1896) the steel bottom M (fig. 25) of the furnace chamber is mounted on a copper support R, which is cooled by water supplied through E.

The latest Gired furnaces employ electrodes which are either of graphite covered with metal or else entirely metallic. In the former arrangement (fig. 26), the object of the metal covering over the graphite is to protect the furnace charge against carbonisation. The poles R are embedded in the refractory brickwork of the furnace.

FIG. 26.

FIG. 27.

and the path of current flow from them to the upper electrode E is as shown by the dotted lines fig. 26—i.e., such as to traverse the entire thickness of metal in the furnace. The alternative arrangement (fig. 27) employs several steel poles P set in canals in the masonry of the furnace and water cooled at their lower extremity. As in the furnace illustrated by fig. 24, the canals c (fig. 27) are filled with pieces of metal which melt and then form a protection to the actual pole pieces. The latter are connected in parallel outside the furnace, and the masonry is naturally of such material and construction as not to be rendered conducting by the heat to which it is exposed.

Compound Electrodes.—A furnace bottom of pure carbon often presents serious inconveniences, particularly in the electrometallurgy of steel. In the latter case, the carbon combines with the charge to such an extent as to make impossible the production of low-carbon metal. This difficulty may be overcome by using a magnesia bottom, but it is then necessary to allow for the fact

FIG. 28.

that magnesia is not an electrical conductor. A satisfactory compromise is to use a mixture of refractory non-conducting material (magnesia, dolomite, silica, &c.) with a carbonaceous, electrically-conducting binder of pitch, graphite and tar in various combinations.

No metallic conductor is used in this case, and the composition of the pisé may be varied so that the surface layers, in contact with the steel, contain insufficient carbon to carbonise appreciably the molten charge. This construction has been used successfully in the

Firming steel works. Numerous mixtures have been tested, and it is found that the ingredients do not cohere well with less than 2½ per cent. of tar, whilst with more than 10 per cent. the mixture becomes too liquid. The mixtures most used are cast-iron turnings, tar and calcined dolomite, and graphite, tar and calcined dolomite. From these ingredients it is easy to make refractory floors containing 10 to 20 per cent. of carbon, which become very good conductors at high temperature after a preliminary heating, and then remain sufficiently good conductors for regular working to be commenced without further preliminary heating. Similar results are obtained if the dolomite be replaced by magnesia or siliceous sand.

The first melt from such a bottom naturally contains some excess of carbon, due principally to tar driven off during the early stages of heating. Analyses of consecutive melts of steel turnings, containing 0·16 per cent. of carbon, 0·36 per cent. of manganese, and 0·349 per cent. of silicon, gave the following results:—

	First melt. Per cent.	Second melt. Per cent.	Third melt. Per cent.
Carbon ...	0·226	0·102	0·140
Manganese ...	0·161	trace	0·073
Silicon ...	0·060	0·027	0·069

The second and third melts are normal, the carbon content being inappreciably affected by the electrode. The latter requires very little repair in service.

Compound Melting Electrodes.—This name is used to describe a type of upper electrodes due to Gin and containing the metal (or a compound of the metal), which it is desired to alloy with the molten material in the furnace. For instance, in the manufacture of ferro-tungsten there is used a furnace with two vertical electrodes in series composed of cast tungsten or of tungsten carbide. The furnace charge consists of iron oxide and tungsten dioxide. When the furnace is in action, the electrodes of tungsten carbide melt and their carbon burns at the expense of the oxides in the charge, which is thus reduced. The alloy obtained contains not more than 0·15 to 0·25 per cent. of carbon. Similar compound electrodes may be used in the manufacture of ferro-molybdenum.

Reinforced Electrodes.—Metal "reinforcement" is sometimes used in carbon electrodes with the double aim of increasing their electrical conductivity and their mechanical strength. Héroult, for instance, bores a hole through the electrode (axially) and fills it with an alloy of aluminium and silicon. The Plania Works (Ratisbon) introduces bands of copper or iron into the electrode before or after baking, this process being especially recommended for long electrodes, which are thereby much strengthened. Use is made sometimes of composite electrodes consisting of a tube of carbon or iron filled with lime, iron oxide, or other scorifier, which is thus carried, during the operation of the furnace, to the hottest part of the charge.

Keller Steel-Magnesia Electrode.—A bottom electrode which is absolutely non-carbonising and at the same time very strong and durable and of high electrical conductivity is shown in fig. 28. Iron bars A from 1 to 1½ in. square are set vertically and close together in a metal base plate P. A secondary conductor, such as magnesia, is made hot and rammed very tightly between these bars, thus providing an "armoured" block of refractory material which is very durable and of exceptional mechanical strength, whilst it has the advantage of permanent through conductors to secure low electrical resistance and easy starting from cold. The upper layers at least of the secondary conductor have appreciable conductivity when the furnace is working, and owing to this and to the distribution of the bars A in close spacing over the whole base of the furnace, current flow through the charge is exceptionally uniformly distributed. In spite of the large proportion of magnesia which gives the base its durability, the electrical resistance is almost nil. The metallic portion of the electrode is cooled by water circulation at i. The refractory material between the steel bars hardens in service, so that the whole is remarkably durable. Operation is certain and simple, electrically and mechanically, and it is unobjectionable from the chemical point of view. There is no appreciable industrial loss.

The author of the articles from which the foregoing abstract has been made is M. JEAN ESCARD, Civil Engineer, Lauréat de l'Institut de France and of the Société d'Encouragement pour l'Industrie Nationale.

THE HIGH-TENSION MAGNETO.

At a meeting of the AERONAUTICAL SOCIETY OF GREAT BRITAIN, on April 14th, Mr. A. P. YOUNG, A.M.I.E.E., read a paper on "The High-tension Magneto, with Special Reference to the Ignition of Aeroplane Engines," which was printed in the *Aeronautical Journal* for April-June, 1917.

The paper is a lengthy one, dealing comprehensively with the various aspects of the subject, on which, as the author remarks, the amount of technical literature available at the present moment is very meagre. He points out that the degree of success achieved in the development of the combustion motor has at all stages been primarily dependent upon the efficiency of the ignition system used, and claims that the rapid strides which have, during recent years, been made in the construction of the petrol motor, *per se*, have mainly resulted from the very satisfactory high-tension ignition system that has been available. Without the high-tension magneto it is almost certain that the aeroplane would

never have reached its present high state of development, and the whole course of the present disastrous war would have been different, and much less in our favour.

Prior to the outbreak of war, the number of high-tension magnetos being produced in this country formed a negligible proportion of the total number being used for a variety of purposes. Through laxity on our part, this most vital "key" industry was allowed to develop in Germany, but the war has taught us a lesson in this respect; during the period of the war the magneto industry in this country has developed at a really wonderful rate, and all those participating are to be congratulated on the present healthy and hopeful state of the industry.

The British Ignition Apparatus Association is at the moment supported by 10 British magneto manufacturers who have, during the period of the war, supplied to the Government for war purposes, and chiefly for aeroplanes, no fewer than 200,000 magnetos. The British magneto as at present constructed is the equal of the pre-war Bosch magneto emanating from Stuttgart, and certain developments now taking place will result in the British manufacturers producing new types of magnetos that will prove to be vastly superior to anything turned out of Germany in the past.

The author urges that when the war is over, British magneto manufacturers should be encouraged and supported by Government and public alike, so that there may be established on a solid foundation a British industry producing magnetos and ignition apparatus unsurpassed in quality and design.

After tracing the history of electrical systems of ignition from Faraday's discovery of electromagnetic induction in 1831 to recent times, Mr. Young turns to the technical aspect of the subject, and states that any form of high-tension magneto consists of four

FIG. 1.—DIAGRAM OF CONNECTIONS OF MAGNETO WITH SIX-CYLINDER DISTRIBUTOR.

essential parts:—(1) A magnet system; (2) an iron core wound with primary and secondary; (3) a contact-breaker to interrupt the primary circuit at predetermined intervals; (4) a high-tension distributor.

The arrangement of connections generally adopted is illustrated in fig. 1. The earthed primary contact (B) is actuated by some form of cam, so that the primary circuit is continually being closed and opened.

The iron core which carries the armature windings may either revolve or be fixed. In the latter case, the rotor comprises certain iron masses so disposed that every 90° or 180° (depending upon whether the magneto is a two-spark or a four-spark), the flux flowing from the N pole of the magnet to the S pole, through the armature core, is suddenly reversed. When the armature rotates the flux reversal occurs—except when specially-shaped poles are fitted—every 180°, and the magneto gives two sparks per revolution. Magnetos provided with stationary armatures are said to be of the inductor type. The cycle of operations is as follows:—

FIG. 2.—TYPICAL FLUX, VOLTAGE, AND PRIMARY CURRENT WAVES FOR H.T. MAGNETO.

FIG. 3.

(a) The rapid reversals of flux in the armature core induce in both primary and secondary an alternating E.M.F., the maximum E.M.F. being reached for any given speed, when the actual flux in the armature core is substantially zero.

(b) The cam operating the contact breaker lever is so designed that the primary circuit is closed during the period when the induced voltage is growing from zero to its maximum value, and for some little while afterwards, but not until the voltage has become zero again.

(c) During the period of closure of the primary circuit the induced current will steadily increase in value. Then at a certain instant the contacts are suddenly separated by the cam. The condenser in parallel with them ensures that there is no sparking at this instant, consequently the rupture of the primary current is remarkably sudden.

(d) The sudden rupture of the primary current causes an instantaneous collapse of the magnetic field associated with it, and as this field is linked with the secondary turns, an enormous voltage is induced in the secondary winding at this instant. This voltage is sufficient to initiate a spark between the electrodes of the spark plug, and this spark is maintained, to some extent, by the voltage induced in the secondary by virtue of the continual flux change in the armature core produced by rotation during the period that the contacts remain open.

(e) After a certain short interval of time the cam allows the contacts to close again, and the cycle of operations (b), (c), (d) is repeated.

Theoretically, the whole of the energy stored up in the primary winding during the periods when the contacts are closed, and the primary current is creating a magnetic field, should re-appear in the secondary spark at "break" if there were no losses.

Actually, certain losses occur during the transfer, and only a portion of the energy stored magnetically appears in the H.T. spark. Generally speaking, about 80 per cent. of this energy is available for ignition in a well-designed magneto.

The maximum primary current for any given design is, within limits, proportional to the maximum armature core flux, this in turn being dependent on the magnetic characteristics and design of the magnets used. As the energy in the high-tension spark is proportional to the square of the primary current, the energy liberated at each discharge (that is, the intensity of the spark, but not necessarily the power of the spark to produce ignition) is proportional to the square of the maximum value of the flux produced in the armature core on open circuit by the system of magnets used. It is therefore evident that the magnet flux is one of the controlling factors in the design of any magneto, and very careful attention has been given to the magnetic quality of the magnets and the design of the whole magnetic system to ensure that the best results are obtained.

The rate at which the secondary voltage rises, and the value of the maximum reached, are dependent on the primary current broken; on the self-induction of the primary at "break"; on the ratio of secondary to primary turns; and on the characteristics of the magnetic circuit. It is necessary that the magnetic field created by the primary current shall instantly collapse at "break." A magnetic circuit which is totally laminated will ensure a more rapid dying-away of the magnetic field than will occur if there are in the magnetic circuit any solid masses in which eddy currents may be set up during the period of change, these eddy currents, by their reaction, tending to retard the rate at which the collapse of the magnetic lines occurs.

The character of the secondary voltage wave during the period of the high-tension discharge is of considerable importance, because the maximum value reached would seem to have some influence on the power of the spark to produce ignition. Furthermore, the shape of the wave controls, to some extent, the rate at which the energy liberated in the high-tension spark is dissipated, and the author holds the view that the rate of energy discharge is of more importance than the total amount of energy liberated, although the latter factor must be taken into consideration.

Experiments made on magnetos indicate that the voltage rise in the primary winding at the instant of "break" is very much greater than one would anticipate. It is reasonable to suppose from these experiments that a correspondingly abnormal rise of voltage occurs in the secondary at "break"—this voltage, of course, only being maintained for an infinitesimal period of time—and the curve shown in fig. 3 represents the way in which the author imagines the secondary voltage to vary during the period of the high-tension spark.

The voltage suddenly rises to a maximum and then suddenly falls again, the rise and fall occupying a time T_1 , during which period there is no actual discharge between the electrodes, but the gases in the vicinity are being ionised preparatory to a discharge which occurs at the point A, and is maintained during the subsequent period T_2 , at the end of which the voltage has dropped away to zero.

As soon as the spark is initiated at the point A the discharge is maintained to some extent by the voltage induced in the secondary winding in consequence of rotation, and this voltage is virtually superimposed upon the voltage induced as a result of the collapsing of the magnetic field stored in the primary prior to break.

Unfortunately, the present state of our knowledge concerning the process of ignition by means of a high-tension spark is by no means complete, but Mr. Young suspects that the maximum value of the secondary voltage reached is a controlling factor, and it is even within the bounds of possibility that the ionisation occurring as a result of the sudden application of an enormous voltage during the extremely small interval of time T_1 may in itself be sufficient to initiate the explosion. It has been demonstrated that ionisation in itself will produce an explosion, even though no spark occurs, and the apparent superiority of the polar inductor type of magneto over the rotating-armature type may be due to the fact that the secondary voltage wave is steeper and reaches a higher maximum during the interval T_1 , in consequence of the armature circuit being more thoroughly laminated, and therefore allowing of a more rapid flux change.

A common trouble experienced with the ordinary type of dis-

tributor in which a carbon brush is used is that the carbon dust generated is liable to be ground into the brush track of the distributor, thus producing a path of low resistance between the segments, this disease being known as "tracking." In certain cases, and particularly when two six-cylinder magnetos are used in conjunction on a 12-cylinder engine, tracking of this kind is very liable to cause misfiring, because the spark, rather than discharge between the electrodes of the spark plug in the cylinder under compression, will leap along the surface of the brush track in the direction of rotation to the next segment which is connected to a spark plug in a cylinder at practically zero pressure, the resistance of this alternative path being extremely low.

Experiments have shown that even with a distributor that is badly tracked, misfiring can be entirely eliminated if, instead of the ordinary carbon brush, a metal brush be used, this being so arranged that there is a very small air gap (about 0.01 in.) between the face of the rotating metal brush and the distributor segment. The superiority of this arrangement over the distributor and carbon brush combination would seem to be due to the fact that the introduction of a small air gap in the high-tension circuit, such as is interposed between the end of the secondary winding and the outside circuit, completely insulates the secondary during the small interval of time T_1 , and thus allows the voltage to rise to a very much higher maximum value than would be the case if there were any leakage paths of low resistance. This is a further confirmation of the view that the value of the maximum value of the secondary voltage at "break" is of vital importance. The spark-gap form of distributor has been tried with considerable success on aeroplane magnetos both in this country and in France, and is used generally on all the battery-ignition systems designed for automobile work in use in America. In the author's opinion it seems to be an advance in the right direction, provided that sufficient care is given to the design of the brush-holder and proper precautions are taken to ventilate the distributor, so that the products of ionisation resulting from the minute spark between metal brush and segments have easy means of escape.

The function of the magnets is to produce and maintain, in spite of the very severe conditions under which a magneto has to operate—including severe vibration and cyclic changes in temperature—a practically constant flux in the armature core. In comparing permanent magnets of different quality, it is usual to determine the remanence (B_r) and the coercive force (C_f). These factors apply to a closed ring of the steel, which is capable of being completely and uniformly magnetised. The remanence is the flux density in the steel, after the magnetising force H_{max} (usually 400) has been removed, and the coercive force is the demagnetising force that has to be subsequently applied to reduce this flux density to zero. The B.T.H. Co. accepts only those magnets which show on test a remanence and coercive force in conformity with the following:—

1. The product of remanence and coercive force in c.g.s. units must not be less than 580,000.

2. The actual coercive force must not be less than 55.

Experiment has shown that the active armature core flux in a magneto of given design is greatly dependent on the product of remanence and coercive force, or upon what the author terms the "magnet strength," using this expression to denote the factor $(B_r \times C_f)/10^4$. The spark energy output, being proportional to the square of the armature core flux, must in consequence be dependent on the magnet strength to a much greater degree.

The product remanence and coercive force is therefore a very important factor, and, generally speaking, it is sufficient when testing magneto magnets to measure this product only, because as a general rule a magnet which shows a product of not less than 580,000 will have a coercive force not less than 55. In other words, such a relatively low coercive force as 55 is usually associated with a remanence of the order of 10,500.

Looking at a magneto magnet from a purely mechanical standpoint, it is necessary that the pole faces, and also the edges, should be finally ground, after hardening, to a fairly fine degree of accuracy. It is of great importance that the ground pole faces be parallel to each other and exactly at right angles to the ground edges. The following limits are now being worked to by Sheffield manufacturers:—

Distance between the ground pole faces—Maximum + '2 mm.

—Minimum - '2 mm.

Width of magnet—Maximum + '15 mm.

—Minimum - '15 mm.

These limits may at first sight appear to be large, but it should be remembered that a hardened tungsten-steel magnet is a very difficult thing to grind, particularly when it comes to grinding the inside pole faces, because trouble is encountered, due to the springiness of the magnet itself.

The author draws attention to the very excellent way in which the various Sheffield steel manufacturers now engaged on the manufacture of permanent magnets have carried out their work. Bearing in mind that at the outbreak of war practically no permanent magnets were produced in this country, and that this subsidiary key industry was entirely in the hands of Germans, the results so far achieved are very gratifying, and reflect great credit on the British steel manufacturers, who, by virtue of their resourcefulness and skill, have grappled so successfully with this difficult problem. His own experience is that at the present time permanent magnets for magnetos are being produced in this country which are quite equal—and in many cases superior—to anything that has been produced in Germany in the past.

(To be continued.)

LEGAL.

GLASGOW CORPORATION ELECTRICAL EMPLOYEES: ARBITRATION CASE.

WE have received a copy of arbitration proceedings between the Electrical Trades Union (on behalf of three of their members) as claimants, and the Glasgow Corporation Tramways Department as respondents. The Arbitrator repelled the respondents' plea that the arbitration was incompetent, and found that the claimants were reasonably entitled to the advance claimed of 4s. per week upon their upstanding wage of 40s. The men, who were assistants known as "improvers," were promoted to take charge of stations when certain station charge hands were called to the Colours, and they had for a long period been doing the work of charge hands. The Arbitrator stated that the claimants' training and length of experience as charge hands entitled them to the 44s., which was the recognised wage of a qualified charge hand. In addition to their upstanding wage the claimants receive war bonus additions amounting to 9s., but with that the proceedings were not concerned, as the dispute was only in regard to the upstanding wage. The money element was not the important question in the case. The respondents contested the claimants' claim for an advance upon a ground of principle which was novel, interesting, and important. The respondents' contention was that the claimants did not fall within the Arbitration Provisions of Part I of the Munitions of War Acts at all, and so the arbitration was incompetent. The provisions of Part I apply to "Any Employer" and to "persons employed" on or in connection with munitions work. The claimants were admittedly "persons employed," but the respondents contended that the expression "Persons Employed" had a limited meaning, and included only workmen who were paid on a time rate or a piece-work rate, which was subject to interruption by any cessation of work, and that it did not include men of the class to which the claimants belonged, who received an upstanding wage, which was not interrupted by their absence on holiday or through illness. All station charge hands such as the claimants, received an upstanding wage for a normal week of six shifts. If, owing to shortage of staff or other emergency, they required to work more than six shifts, they received, *pro rata*, extra pay. They were allowed a fortnight's summer holiday in the year without interruption of the upstanding wage, which also continued to be paid during absence through illness. But this domestic arrangement did not affect the question of principle which was raised in the case. It might be an element to be taken into consideration in fixing the amount of the upstanding wage, and he had taken it into consideration in finding that 44s. was a reasonable wage, but this was not an element in deciding whether the claimants fell within Part I of the Act. He was unable to accept the respondents' limited interpretation that the Arbitration privilege belonged only to what might be termed operatives, as distinguished from what were known as staff hands. The Act was not limited to operative workmen, but applied also to classes who were accustomed to be remunerated by an upstanding wage, and whose remuneration was not interrupted by absence on holiday or through illness. The leading purpose of Part I of the Act was to prevent a strike or lock-out occurring during the war. The Arbitration provisions were the counterpart of the prohibition-of-strikes provisions. Either an employer or an employé might seek the aid of the Arbitration provisions to settle a difference. It had, perhaps, not been a common practice for foremen, or clerks, or typists, or charge hands to take part in a strike so freely as operative workmen were inclined to do, but there was nothing to prevent these classes taking combined action to cease work for the purpose of compelling the adoption of working conditions, and, if they should do so, they would undoubtedly fall within Sec. 2 (1) of the 1915 Act, and become liable to prosecution. The claimants' freedom of action was restricted just in the same way as was that of a workman paid on a time or piece-work basis. The strike prohibition took no account of whether a person employed was remunerated by an upstanding wage, or otherwise. The policy of the statute was that every "person employed" who was under the restriction of Sec. 2 (1) had the corresponding privileges conferred by Sec. 1 (1). The Arbitrator held that the claimants were entitled to the increase of 4s. which they sought from the date the difference was referred to arbitration.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AGEEKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 8d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

FOREIGN AGENTS:

ADELAIDE: Messrs. Atkinson & Co., Gresham Street.

AUCKLAND N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 31A, Strand Arcade, Queen Street.

BRISBANE: Gordon & Gotch, Queen St.

CHRISTCHURCH, N.Z.: Gordon and Gotch, Manchester Street.

DUNEDIN, N.Z.: Gordon & Gotch, Princes Street.

JOHANNESBURG, CAPE TOWN, BLOEM-FONTEIN, DURBAN, PORT ELIZABETH, &c.: Central News Agency, Ltd.

LANCASTER: Gordon & Gotch, Cimitiere Street.

Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, and crossed "London City and Midland Bank, Newgate Street Branch."

MELBOURNE: The Mining & Engineering Review, 90, William Street; Gordon & Gotch, Queen Street.

THE ASSOCIATION MOVEMENT.

A FORTNIGHT ago we briefly recorded the gist of an important speech made by Mr. L. A. Paish, on behalf of the Government, to the members of the Birmingham Brassmasters' Association.

It will be recalled that Mr. Paish then announced the Government's desire to support and assist in the formation of Trade Associations to the end that British manufacturers may be more efficiently organised and equipped to combat overseas competition after the war.

This Government advocacy of the association movement is welcome evidence of the new spirit which permeates the revitalised Commercial Intelligence Branch of the Board of Trade, whose efforts on behalf of British trade deserve all possible encouragement.

The justification of, and the necessity for, the existence of trade associations has been amply demonstrated on many occasions, but never so conclusively as in the present period of national stress.

The Government in particular has appreciated the advantage of being able to get into close contact with an entire trade through the medium of a well-regulated association representative of that trade, and the individual firms engaged in trade have learned that their policy and needs can be more effectively voiced by such a body than by their unorganised individual representations.

A prominent instance of such mutual recognition was provided by the Government's recent employment of the organisation of the Cable Makers' Association as the controlling authority for the distribution of the restricted supplies of copper amongst all British cable-makers—whether members of the Association or otherwise—for the purpose of facilitating the manufacture of insulated wires and cables required for repairs and maintenance.

It is well known that these functions were faithfully performed, and that the Government, the producer, and the consumer, all derived substantial benefits from the assistance thus afforded them by an Association which, according to its early critics, could not be expected to help anyone outside its own roll of members.

The C.M.A. is thus doing work of national importance, and, as is usual when an individual or an institution achieves distinction, we are encouraged to examine its origin and policy in the hope that the path of those who follow may be illumined by the light of the experience of those ahead.

Such a review becomes an urgent duty when we realise the increased attention now being devoted to the "association movement" and industrial organisation generally.

THE "ELECTRICAL REVIEW'S"
ELECTRICAL & ALLIED TRADES DIRECTORY
(THE RED BOOK),

1917 EDITION

NOW READY.

H. ALABASTER, GATEHOUSE & KEMPE,
4, Ludgate Hill, London, E.C. 4.

Parenthetically, it may be hoped that the time is not far distant when each and every trade in the country will have its own trade association, competent and empowered to voice its opinions on the council of a Federation of such associations, to whom the Government could safely turn for guidance on all matters pertaining to industrial legislation.

It is probable that the comparatively backward state of the association movement in this country is to some extent due to the trait which, in an Englishman, is euphemistically described as "a sturdy spirit of independence." Although invaluable in pioneering and colonisation, this spirit becomes almost a handicap in a highly organised community in that it is liable to prevent the British manufacturer from co-operating with others engaged in his trade, even after such co-operation has been shown to be essential to his own welfare.

Reverting to the origin of the C.M.A., we find it was founded about 20 years ago, at a time when the public generally had no experience to guide them when buying electrical equipment, and when, accordingly, the *price* was the chief, and often the only, consideration.

Any cable-maker desirous of improving the quality of his goods was further hampered by the circumstance that in many cases his superior, and consequently more expensive goods, differed in *appearance* very slightly from those of his less scrupulous competitor, whose object was to make immediate profits rather than an enduring reputation.

The inevitable result was that the manufacturers were brought to the verge of ruin by their cut-throat competition, and the consumers slowly came to realise that the policy of accepting the lowest price was not always an unmixed blessing.

A few of the manufacturers therefore came together and formed the nucleus of the C.M.A. on the basis of their common agreement that it was vital in the interests of the entire electrical industry that their cables should conform to at least a minimum standard of quality, and the well-known "Association grades" were accordingly established.

Having set up these agreed standards of quality, the adoption of standard prices was an obvious and necessary sequel, and the public accordingly has for years been able to rely upon buying goods from any member of the C.M.A. at the same price, and of at least the same minimum and sufficient standard of quality.

As each member was at liberty to devote his profits to the betterment of his goods, there naturally arose a very keen competition in *quality*, which has been advantageous to the maker and user alike, whereas the former unrestrained competition in *price* was disastrous to both.

To-day, thanks to the initiative of the founders of the C.M.A., the goodwill of the expression "Association grade" is of an international character, and stands so high that the best recommendation those interested in the sale of non-C.M.A. cables can think of in appraising their goods is to claim that they are "equal to Association quality."

From the above, it will be seen that one of the principal ideals of each new trade association, as and when it is formed, should be the maintenance of the *quality* of their goods, or, as expressed by the late Prime Minister (Mr. Asquith), when speak-

ing on the Paris Economic Conference in the House of Commons on August 2nd, 1916, "the development of trade associations for common action at home and abroad to raise the average standard of production."

A New Electric Vehicle Maintenance Scheme.

IN the opinion of the Commonwealth Edison Co., of Chicago; the psychological moment has arrived to render particularly easy and attractive the pathway of the intending purchaser and user of electrical motor vehicles. Accordingly, the company in question has just issued details of a scheme which it has had under development for the past 18 months, whereby owners of such vehicles can secure complete maintenance of their machines, including garaging, charging of batteries, renewal of all wearing parts, periodical body painting, and the like, for a stipulated contract term at a flat rate based on an estimated daily service.

The scheme, which includes the erection of an electric vehicle garage with a capacity of about 100 machines, has been developed by Mr. Wm. P. Kennedy, a New York consulting engineer, who has had many years' experience of the electric vehicle problem, involving a complete examination of haulage methods and requirements, including the operating costs of many firms now using electromobiles. Following the example of the majority of electric light and power supply undertakings, the Commonwealth Co. does not intend to undertake the direct sale of the machines, although it is prepared to facilitate the arrangement of payments if clients so desire. Customers may select any one of the standard makes of industrial electric motor vehicles, thereafter providing only the drivers, paying the insurance charges, and making their own provision for depreciation. All other charges will be borne by the electric supply company under the terms of its contract. The latter provides for the maintenance of the vehicle in every respect, the basis charge being determined on the experience that most electric vehicles can be operated satisfactorily on a single battery charge per day. Where excess mileage is necessary, "boosting" charges will be furnished, the so-called "excess" over the standard service allowance being charged to the client at a figure which includes allowances for tire wear, renewal of worn parts, and other elements covered by the service, in addition to the cost of the extra energy put into the battery. The system throughout is based on the theory that the amount of energy taken out of the battery denotes the service the vehicle is yielding, and in that way measures its periodic requirement for maintenance.

Careful examination of performance records and maintenance outlays for large installations extending over considerable periods have enabled the company to fix upon a figure that assures it ample protection against loss, whilst at the same time affording the client a complete service guarantee at no advance over the ordinary costs for maintenance under the usual garage conditions. As a large buyer of tires, battery replacements, and other supplies, the company is naturally able to give service at a minimum of cost, figuring a safe operating margin on the basis of averages. The new maintenance system is not to be confused with the usual battery service systems which are in operation in various parts of the United States, for the reason that it comprises complete maintenance of the vehicles, including the supply of electrical energy, whereas the battery service system generally only comprises the supply of energy and battery maintenance.

AN APPROXIMATE METHOD OF CHECKING THE ACCURACY OF A DIRECT-READING INSULATION TESTING SET.

By G. W. STUBBINGS.

SUCH direct-reading instruments for the measurement of insulation resistance as the Megger and Ohmer are in very common use, owing to their convenience and portability. They enable insulation resistance to be tested at a much higher voltage than do such galvanometer and portable battery sets as the Kelvin, while they possess the important advantage over other testing sets requiring a pressure supply from the mains, of being available for use anywhere. There is, however, no direct method of checking the accuracy of direct-reading instruments except by the use of standard high resistances. The comparison of the insulation resistance of, say, a piece of defective cable, as measured by a Megger at 500 volts, with a corresponding measurement using a Paul set taking pressure from 240-volt lighting mains would give no reliable indication of the relative accuracy of the two instruments, owing to the difference of the voltages. Standard resistances even as high as one megohm are, on the other hand, costly, certainly too much so to justify purchasing them for this isolated use. The purpose of the present article is to suggest a method of checking the accuracy of direct-reading testing sets, by using a moderately high resistance in series with an E.M.F. opposed to that of the magneto generator. The apparent resistance of such a combination can be made as high as may be desired by adjusting the difference between the counter E.M.F. and the voltage of the generator.

The principle of the action of direct-reading insulation testing sets may be briefly recapitulated. They depend

FIG. 1.—DIAGRAM OF CONNECTIONS.

upon the interaction of two magnetic or electrical fields, the one proportional to the voltage of the generator, and the other proportional to the leakage current through the fault. As this leakage current will be proportional to the voltage of the generator, the fault resistance meanwhile being constant, it follows that a variation in such voltage will affect both fields to an equal extent, and will have no effect on the readings of the instrument.

If such a direct-reading set be connected up to a high resistance in series with an E.M.F. opposed to that of the generator, the current through this resistance will depend upon the difference between the counter E.M.F. and the voltage of the generator, and the apparent resistance as indicated by the instrument will be higher than the actual value. If v be the voltage at the terminals of the instrument, E be the back E.M.F., and r the value of the resistance used, the current will be $(v - E)/r$, and the apparent resistance R , will be given by $R = v r / (v - E)$. If the voltage across the resistance be e , then $e = v - E$ and $R = r(E + e)/e$.

The method can be readily adapted by using the supply mains as the counter E.M.F., and an ordinary voltmeter whose resistance is known. The value of e can then be read off directly. The instrument will then be connected up as shown in the diagram, fig. 1, the connections being such that the voltmeter reads backwards before the generator handle is turned. When the generator volts are equal to the supply voltage the voltmeter reads zero, and the testing instrument reads "infinity." On raising the generator voltage, the reading of the testing instrument diminishes, whilst that of the voltmeter increases. By taking simultaneous readings

of the testing instrument and of the voltmeter, a very complete check can be obtained.

Assuming a supply voltage of 180, and a voltmeter reading 500 across the scale, such voltmeter will have a resistance of about 50,000 ohms. By regulating the speed of the generator armature to obtain readings of 5, 10, 15 and 20 on the voltmeter, values of R , the apparent resistance of the voltmeter, will be respectively 1.85, 2.45, 1.65 and 1.00 megohms. The method will only give approximate results for high values of R , as the corresponding values of e are observed on the low part of the voltmeter scale, but the accuracy will be sufficient to be very useful.

For checking values of R below 1 megohm a lower voltage should be used. This can be readily obtained by connecting a number of lamps in series across the outer lighting mains, and taking tappings at suitable points. The testing set can then be tested over its whole range without there being any need for an excessive generator voltage.

SPECIALISING AND SPECIALISTS.

By "TRAMP ROYAL."

It was during the war that I sat in the office at Berlin and learnt from my colleagues and the daily Press that England was crushed and the British Empire a thing of the past. At that time I could hardly class myself as either a specialist or an all-round man—for it was the Boer War to which I refer. What I am now is another story; but at that time I had great ideas upon specialisation, and I was developing in the hotbed of the genuine article. I saw men who earned their meagre salary checking strains and stresses in designs of building work, others who made steam calculations, and others who handled railway track problems day in and day out. I rubbed shoulders with foremen who were thoroughly trained as foremen, and workmen who were trained to do their bit skilfully, but to leave the thinking to others. We British—yes, and our American cousins—have felt the results of these intensive methods for many years. The German, in spite of his broad elementary and secondary education, falls easily a victim to the specialist mycelium; he soon loses both adaptability and initiative. The American, as an individual, is not a specialist, but rather a mass of energy in a groove. Although, generally speaking, he is a routinist, he is ever ready to tackle a new problem in a new way, because he has an inherent sense of adaptability.

In a little over a hundred years ago it was possible to grasp all the knowledge there was to be had of modern science; but, at the present time, no individual can know all the facts that have accumulated. Science and technology have now become so much broken into sections that if one is to be a useful worker one must specialise. Driven to this conclusion, we immediately set to work to shut ourselves in watertight compartments, and, making a mental picture of ourselves as specialists, we run the risk of losing grip of the general trend of science.

It is the exceptional man who becomes the real specialist—he is the "expert" *par excellence*; but to most of us is left the choice between a superficial covering of a large area and a developing of one's strong points. For efficiency, the latter choice must be made. How pleasant it is to feel that the division of labour makes it unnecessary for us to learn how to repair boots, starch collars, weave straw hats, and drive a motor-bus before we can put in an appearance at the office. Instead of devoting our energies upon learning a multitude of things, we can concentrate upon a few particular things—such as the prices of raw material, the functions of relays, and the labour problem.

The call becomes daily more urgent for good, all-round men who can specialise. By focussing for a time upon one small subject or line of work, one can get hold of all its details, and at the same time broaden the base of general knowledge. One's line of work at a certain time might make it an advantage to specialise upon cable joints and jointing, and a few years later, perhaps, supply meters or steam traps might offer themselves for concentrated study.

It must be our strong points that we build into our specialities; there is no room for average ability. As the old adage has it, "Strike while the iron is hot." Steep oneself in a thing until it is absorbed. Waste little time over weak spots. Develop the strong points, and continually bring them to bear upon every phase of work. We shall thereby produce, as it were, peaks of maximum experience, and these peaks will coincide with our natural abilities, opportunities for advancement, and external influences. During the process of absorption a few excursions around the edges of the territory of the man higher up will prove an advantage, as they will give a broader view to one's work.

The engineer who is not a specialist, but who makes a speciality of some small item, and gets thoroughly in touch with its bearing upon general experience, not only tends to become an expert, but really increases his efficiency in his more expansive every-day line of work. The man with this broad mental scope and ability to concentrate often beats the ordinary specialist on his own ground. There is a psychological reason for this: the mind being brought to bear continually upon a subject a stage is reached which one might call the point of saturation. In economic science there is such a thing as the Law of Diminishing Returns, which applied to specialisation means that if we work at one thing several hours we progress; more hours and we gradually fall off in production; go on increasing the hours, and we reach a stage at which our subject becomes unproductive or stagnant.

On all sides we find Nature specialising: Special organs for digestion, special developments for different geological ages, and it is only by specialising that many members of the animal kingdom are able to exist. They are not specialists, but they have developed a special function or organ. The Pholas specialises in rock or timber boring, its shell being of the nature of a round file. Its activities are limited: it cannot crawl and it cannot crack nuts. The burying beetle, on the other hand, cannot bore rock, but has its body specialised into a digging machine, and its labours are limited to those of grave-digger. A bird, which is higher in the scale, can fly, use its beak as a pick, pair of pliers, or tongs; it can walk, and sometimes swim. The hand of man can be trained to the art of using the saw or gimlet, equally with that of holding a plough, using a needle, or a pair of compasses. He can travel on land, in water, and in the air. Specialising for him must mean more than a rut—it must mean a cutting edge with a solid backing.

In conclusion, I would recommend cultivating a genuine interest and a warm enthusiasm for one's work. No matter what kind of work comes our way, make it individual—give it something characteristic. Remember that the man who can adapt himself readily, but has only ordinary ability, is often found holding a good position, while our brilliant class-mate is unable to land the responsible job because he is too clever to stick at the details and drudgery.

WAR PRICES FOR ELECTRICAL ENERGY.

As in every other department of industry, one effect of the war has been to increase the cost of production of electrical energy and to necessitate increases in the prices charged to consumers. Such advances have been chronicled in our "Lighting and Power Notes" from the commencement, but necessarily are distributed over a great number of issues, as hardly a week passes without an instance arising. From inquiries which have reached us, we infer that the subject is of considerable interest to many of our readers, and have therefore thought it well to bring the data together into a compact form in which they will be readily accessible; the list is not exhaustive, but will probably be found to contain sufficient information for most purposes, and we shall be glad of the assistance of supply engineers, to enable us to bring it up to date on future occasions, if necessary.

The figures given below are additive except where otherwise stated. L. = lighting. P. = power. H. = heating. C. = cooking. T. = tramways. R.V. = rateable value; where not otherwise specified, the increases are understood to apply to all supplies. In the case of complicated tariffs, only the main features are given. The names of months indicate approximately the quarter in which the increase took place (usually following the month named). Prices in pence are per unit.

AFTER-THE-WAR ELECTRICAL PROBLEMS IN RUSSIA.

AMONGST the technico-industrial problems that will come to the front in consequence of the war a very prominent place will be occupied in the post-war era, undoubtedly, by the question of the quickest and most reasonable development of the application of electricity in Russia. Unfortunately, no country previously to the war worked so unreasonably, dearly, wastefully, and unproductively as Russia; and of the various branches of Russian industry, as will be shown below, the Russian electrotechnical industry has been marked by these negative properties to a particularly large extent, says P. Gurievitch in the *Elektrichestvo*. Whilst in Germany, in the years 1900-10, district stations were reasonably introduced, and in the last five years a further great step forward has been made in so-called "grosskraftwerke"—that is, large stations for the supply of electric current to whole provinces, and even whole Governments—the Russian electrical industry has not emerged from the stage of uneconomical local electrical stations. The large power station using water power or brown and grey coal has not yet emerged from the sphere of platonic desire and project. In this irrational and uneconomic management of Russian local electric stations we find, however, a great danger for the whole future of industrial development in Russia.

The great progress made by the electric lamp in Europe and America, which he describes, leads M. Gurievitch to say that the supersession of the kerosene lamp by the electric lamp, owing to advantages of the latter over the former from the point of view of hygienic and sanitary conditions in the houses and workmen's dwellings, and also the greater safety in regard to fire, will become intensified in Russia in the near future, the more so as with the rational installation, production, and distribution of electrical power, electric lighting, at least in the towns, can easily compete with gas, and even with kerosene lighting. Gas and kerosene have their particular spheres of application where electricity, at least in the near future, cannot compete. A great future is in store, without doubt, in the large towns for gas for cooking, and for kerosene and petroleum as fuel for internal combustion engines. In the Russian Press the need is being urged of extending gas lighting, because in Russia a great need is being experienced for by-products of gas production required for the manufacture of explosives; but no doubt such can be obtained in sufficient quantity by the transformation of all the Russian coking furnaces for the recovery of the waste or by-products. With the chronic scarcity of coal in Russia, and the urgent necessity of it for the metallurgical industry, the burning of coal for lighting purposes appears to be, from the point of view of economy, altogether inadmissible, as electrical power can be successfully obtained by the use of cheap fuel—such as brown coal, peat, and the many water courses.

The writer then points out the increasing application of electricity to power purposes, which is leaving the lighting factor in the background; and to show how year by year this is taking place, he provides the following table, which includes the figures for Petrograd and Moscow:—

Year.	Berlin, 1911-12.	Chicago, 1911.	London, 1910-11.	Moscow, 1913.	Petrograd, 1913.
Population in millions...	2.6	2.2	6.5	1.5	2
Useful kw.-hours delivered per head of population ...	170	310	110	87	62.5
Delivered for lighting, per cent. ...	24	19	61	19	39
Motors, per cent. ...	45	12	27	40	33
Tramways, per cent. ...	31	69	12	41	28

This, he urges, shows that only in London and Petrograd has the delivery of electrical energy for lighting purposes surpassed that for other forms of application. In Chicago and Moscow only a fifth and in Berlin only a quarter of the total useful energy was delivered for lighting. Chicago, true, is in a somewhat special position, as a very large quantity of its power is used for the underground railway, whilst in Berlin 45 per cent. and in Moscow 40 per cent. is used exclusively in motors.

In Berlin 35,000 motors were connected in 1913-14, including 6,900 with 24,000 kw. for working metals; 4,755, with 29,000 kw. for lifts; 3,741, with 11,000 kw. for wood working; 3,723, with 8,861 kw. for printing presses; 3,329, with 1,253 kw. for fans; 1,920, with 5,814 kw. for sausage and meat shops; 1,638, with 1,066 kw. for sewing machines, &c. All these data are very interesting, as they illustrate the immense development possible for the introduction of electric motors in the large Russian towns, of which in 1913 there were connected in Moscow (1912), 6,976 electric motors; in Petrograd (1913), 6,851; in Warsaw (1913), 3,103; and in Lodz (1912), 2,404 electric motors.

About the same movement in the development is observed in Russia, where in 1913 the four towns with the largest electric stations used only 82,000,000 kw.-hours for lighting, but 207,000,000 kw.-hours for motors, &c., and 89,700,000 kw.-hours for tramways. With a total delivery in these towns—Petrograd, Moscow, Baku, and Lodz—of 378,000,000 kw.-hours, only 21.6 per cent. was supplied for lighting purposes. In all Russia, with the exception of the eight Governments of the Kingdom of Poland, the supply of electric current for lighting purposes, and also for technical purposes and motors, is shown in the following form, in millions of kw.-hours:—

	For lighting.			For motors and industrial purposes.		
	1905.	1913.	Increase, per cent.	1905.	1913.	Increase, per cent.
Central stations	52.1	175.5	238	47.9	444.8	829
Private "	169.8	209.4	23	212.4	1,045.7	393
	221.9	384.9	73%	260.3	1,490.5	473%

We see from this table that the expenditure of electrical energy in the eight years, 1905-13, for lighting purposes only, increased by 73 per cent., whilst the expenditure for motors and other industrial purposes rose 473 per cent. In other words, the application of electricity for motors and general industrial purposes increased during that time $6\frac{1}{2}$ times quicker than for lighting purposes. But if we take Poland into account, the expenditure of electric energy in 1913 for the whole Empire amounted to about 2,000 million kw.-hours, of which only 20½ per cent. was used for lighting and 79½ per cent. for motors, whilst in 1905 the deliveries for lighting made 46 per cent. and for motors 54 per cent. only.

The figures for Lodz are particularly striking. There, in 1913, there was supplied for lighting only 3,662,000 kw.-hours, against 33,409,000 kw.-hours for motors. Thus we see that even in Russia, in the towns with a large industrial development, the supply of electric current for motors, excepting tramways, exceeds that for lighting by almost nine times.

The Moscow lighting station delivers over twice as much current for motors as for lighting—namely, 51,677,000 kw.-hours, against 24,812,000 kw.-hours. Of the large Russian industrial centres, only Petrograd is distinguished by its backwardness in the supply of current for motors. There, in 1913, only 41,490,000 kw.-hours were delivered for industrial motors, against 18,745,000 kw.-hours for lighting purposes, and 34,872,000 kw.-hours for the tramways.

In a comparison of the prices of electricity it is observed that, whereas in Berlin the normal price is 16 pfennige per kw.-hour, or 7½ coopeks; in Switzerland 16 centimes, or 5.9 coopeks, in Russia, according to figures published in the "Elektrichestvo" in 1913, most of the stations accepted normal and small consumers for motors at 15 or 16 coopeks per kw.-hour—that is, 100 to 150 per cent. more than in Switzerland or Germany. In these dear tariffs, which may properly be called prohibitive, there is great danger for the whole future of the development of the electrical industry of Russia. Losses in working power in the form of men killed and made incapable of work will make at least 5,000,000 by the end of the war; that is to say, a sixth of the productive power in workers of 19 to 15 years of age, as given in the *Torgova Promyshlennaya Gazeta* in 1916. But even if, thanks to a reduction of holidays, Saints' days, and holiday Mondays, and preserving the present obligatory sobriety, the productivity of the remaining live-sixths of the workers is raised to the average level of before the war, such a level is so low in comparison with America, and even Western Europe, that if it is maintained in the future, Russian industry cannot expect, with a whole series of unfavourable conditions of a political, economic, and civilian character, to reach rapidly that stage of development that would enable it by means of a rapid rise in the productivity of the country to recover from the blows of the war, and pass over from the intense (from the economic point of view) unproductivity and exhaustion of war-time work to the productive economy of peace time.

Besides the foregoing, if Russian industry is to operate as previously to the war, then, notwithstanding any protective tariffs whatever, it will not be in a position even on its own market to compete with other countries, whether they be Germany, Japan, or the United States, which during the war have acquired immense capital and established in many branches of industry miracles in the form of factories, the equipment of which before the war is finished will have been paid for completely owing to the large war orders.

But how will Russian industry be in a position to pass over into productive and intensive work?

If we put aside the many causes of a general character that have

prevented and will hinder Russian independence, and limit ourselves only to a review of the strictly technical causes that are intimately connected with the question we are considering—namely, the future of the electrical industry in Russia—we may confidently state that one of the chief causes of the limited productivity and dearth in Russian industry is the too limited application of mechanical power.

American industry, as is known, is distinguished by the highest productivity in the whole world, and that is explained, to a large extent, by the fact that, being always short of hands, the Americans were obliged more than in other countries to adopt the principle of attaining the largest possible result with the smallest expenditure possible of labour. After a lengthy examination of the conditions influencing the industries of foreign countries, paying particular attention to fuel, M. Gurievitch lays great stress on the use made of cheap power, as in the case of Switzerland, and adds that Russia belongs to the list of countries that enjoy such advantages, and that therefore the rational development of the production of electrical power is one of the first problems to be dealt with immediately after the war.

If we turn to the present condition of the Russian electrical industry, we shall see that with very few exceptions—for example, the Moscow station—the Russian electrical stations are equipped irrationally in technical respects, and, above all, with old machines. As the still young electrical industry is in a stage of rapid development, it has of recent years made such colossal progress that the machines installed in the Russian stations 10 or 15 years ago, perhaps at the time the very last word in technical equipment, are at this moment quite unsuitable for electric current production.

According to statistics published in 1913 in the "Elektrichestvo," there were, for example, 47 stations with steam engines of a total power of 228,562 kw., besides 70 steam turbines, and, further, 137 steam engines of an old type, about 72 vertical and 65 horizontal, that had worked at the stations in large industrial centres and consumed unprofitably an immense quantity of coal, which is particularly dear in Russia, thanks to which the stations were obliged to retain their abnormally high tariffs for electricity, corresponding to the position of the electrical industry of 10 or 15 years before. Whilst in Berlin the normal tariff for electric light was only 40 pfennige—18.4 coopeks—per kw.-hour, in Petrograd it was 30 coopeks—that is to say, 63 per cent. dearer. This high Petrograd tariff was due to a whole number of other reasons—dearth of fuel, machinery, and especially cable systems, the creation of three separate companies, with their expensive boards, &c.

But it is certain that in the year 1913 in the Petrograd stations the 25 worn out steam engines, with 15 steam turbines, had a very unfavourable influence on working expenses. If the Russian electrical stations, with their great material expenditure, were modernised, as it is proposed they shall be in Petrograd in the near future, this question of the rational organisation of the production of the electric current in Russia would still remain unsolved as to modernise the existing electrical stations, means at bottom only to limit oneself to patches.

The present basis of the Russian electrical industry rests exclusively on the principle of small local electrical stations with high quality fuel obtained literally from the world's end, and it is essentially irrational and opposed to all the tenets of economy. Every new patch on this unhealthy organism, every new large central station of a local character is only another stumbling block which, in something like ten years, will have to be got over or removed at great expense, as, without a doubt, the Russian electrical industry with the uninterrupted development of things will be obliged in ten years' time, and perhaps before, to change over to the system of large interconnected regional stations which work with water power or cheap brown or grey coal, and are recognised as the only and profitable way for the production of electric current.

That one large electrical station is, in respect to original cost of equipment and current working expenses, more profitable than a series of small stations of equal power is obvious. Here the writer quotes numerous examples of installations in other countries, particularly in the United States, where, all the same, there are many small irrationally exploited electric stations. Thus in 1912 in that country there were 5,221 central stations, of which only 161 had a power of over 5,000 kw., or 3.1 per cent. The same is the case in Germany, where, out of 4,040 stations in 1913, only 103, or 2 per cent., had a power of over 5,000 kw. In Russia, out of 220 central stations only 21, or 9.5 per cent., had a power of over 5,000 kw. This is shown more clearly in the following table:—

	Year.	Total No. of central stations.	No. of stations of 5,000 kw.	Ditto in per cent.	Power of all stations in kw.	Total power of stations of over 5,000 kw.	Ditto in per cent.
United States	1912	5,221	161	3.1	5,135,000	3,610,000	70.3
Germany	1913	1,010	103	2	2,100,000	1,560,000	74.5
Russia	1913	220	12	5.5	—	199,000	—

The Russia item is particularised as follows:—The Moscow electrical station with 35,000 kw.; the Moscow tramways 23,100 kw.; the Petrograd 1886 Co., 45,000 kw.; the Petrograd Belgian Co., 18,160 kw.; the Petrograd Electrical Equipment Co., 18,000 kw.; the Petrograd tramways, 7,500 kw.; Baku, 29,000 kw.; Warsaw, 11,500 kw.; Lodz, 15,000 kw.; Kieff lighting, 7,550 kw.; Odessa lighting, 7,500 kw.; and Riga, 7,060 kw.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Old Lamp Tops.

I note in your issue of September 21st that a correspondent is inquiring as to the best method of recovering platinum from old electric lamp tops. I do not know if he intends dealing with large quantities or only a few thousands at a time. Assuming the latter, the best method to adopt is as follows:—

First of all, break out the cement or plaster and the glass from the caps, then "rough sort" the material obtained in order to reduce the bulk as far as possible. Crush what is left with a pestle and mortar until the plaster, &c., is reduced to a powder. Put the powder on a sheet of white glazed paper, spread on a bench, sit down in front of it, draw a small portion of the powder towards you, and commence blowing it away gently. The platinum and other wire will be left behind. Having done this, sort the wire as far as possible. A magnet should be used for separating the nickel wire, but all wire should be carefully examined for any pieces of platinum which may be attached to it. Put the remainder of the wire in a good porcelain dish, pour pure nitric acid on it, and boil until all the foreign matter is dissolved. Wash well and dry off. The process is a very tedious one, and requires good eyesight. A person can, by sticking at it, recover the platinum from 1,000 lamp ends in eight or ten hours. Needless to say, the boiling should be carried out in the open air, as dense red fumes are given off.

If your correspondent intends dealing with large quantities at a time, it will be necessary to put down special machinery for it.

Harry W. Brown.

Ballycarry, September 26th, 1917.

A Static Electricity Phenomenon.

The experience of Messrs. J. O. Grant & Taylor is similar to that which I have met with in connection with a steam car fitted with rubber-tired wheels. In this case a person standing on the ground and touching the metal work of the car would receive an unpleasant shock.

I also remember another case where a steam engine was driving some printing machinery by means of a 12-in. copper-sewn leather belt. When running, sparks 1 in. to 1½ in. long could be obtained from it by bringing the fingers near the belt.

Harry W. Brown.

Ballycarry, September 20th, 1917.

[The electrification of belting is a not uncommon phenomenon, due apparently to mechanical friction, or, perhaps, more accurately, to contact followed by separation. In paper mills very long sparks can be drawn from the rolls of hot dry paper as it leaves the calendars.—EDS. ELEC. REV.]

The E.T.U. and A.E.S.E.

Being a central station engineer of many years' standing, I should like to make the following remarks in connection with the letters from the secretary of the E.T.U. (L.D.). I am not a member of the E.T.U., or of the A.E.S.E., but after reading the aforementioned letters I should certainly never join the E.T.U. if those are correct samples of their progressive industry. To hit a Society that stands aside (from purely patriotic motives, and loses a number of its unpatriotic members in so doing) is a very low and unsportsmanlike attitude to adopt, especially to a Society that before the war was slowly bringing about some very essential radical improvements in the welfare of station engineers. To my mind it smacks very much of "beer and skittles," and appears to me just why central station engineers who have the least respect for themselves have so far refrained from joining Unions of such an unsavoury nature. Let the status go to blazes if it has to be got thus.

W. G. Ritchie.

Brighton, September 28th, 1917.

Scale on Evaporative Condenser Tubes.

I would advise "Central" to try and prevent the deposit of scale on the tubes by painting the tubes with aluminium paint. It would be interesting to try the effect of this on a small section of the condenser, and I would be very glad if "Central" would let me know the result.

London, W., September 25th, 1917.

C. Orme Bastian.

Fusing of an Electric Wire.

I was interested to read your correspondent's article, but I think that he arrives at the wrong conclusion. "The whole question 'is not' one of efficiency . . . the efficiency of the electrical engineer and his workman." The bulk of his illustrations bring out the fact that the general public think they are quite competent to do electrical work. The draper's assistant and budding electrical engineer, and every other incompetent, thinks he is qualified to interfere with an electrical installation, and that a contractor is quite unnecessary.

As regards the A.C. motors in controlled establishments, these were probably supplied by a wholesale house, or the motor manufacturers, and installed by the firm's own workmen. I know of many jobs which have not been interfered with, which have been "installed and forgotten."

I quite agree with Mr. L. E. Wilson's letter *re* periodical testing, and I think that in apportioning the blame to a large extent to the wholesale house he is getting near the root of the evil.

In a large percentage of installations the following circumstances happen: The installation, as handed over by the contractor, is a sound one. The maintenance is then given to a wireman, engineer, or odd man who looks after the motors and attends to the lights. Extra work is required from time to time, and the man, in addition to his daily work, carries out the extensions, which are very often done in a temporary manner, without any regard to overloading of circuits and other questions, so that in course of time the job becomes anything but a good one; then, if trouble arises, the contractor is blamed, for you cannot expect the man to condemn his own work.

By constituting any odd man about the place as his electrician, the consumer is entitled to trade terms (thanks mainly to the Tungsten Lamp Association), and supply houses, lamp factors, motor manufacturers, and cable makers tumble over one another to supply his wants at trade terms, and assist him in robbing the contractor of his legitimate work. Why should the T.L.A. give terms which make it impossible for a contractor to retain his customers? Why should a motor maker whose motor a contractor has sent direct to a job, be justified in calling immediately on the contractor's customer and offering trade terms? Why should supply houses sell a few dozen accessories or the lamps at trade terms immediately a contractor has finished the installation, and endeavour to cut out the contractor by even going to the length of finding third-rate firms who will fix the material they supply?

Why for a paper cable should cable makers quote exactly the same price to a penny to a consumer as they do to a contractor, seeing that the consumer is only a chance customer and the contractor a regular one, and this, moreover, when the contractor is working for the consumer?

How long is this policy of grab to continue? Is there no honour in the electrical trade? Is the policy of the German firms to be perpetuated by the supply houses, many of whose nationality would not bear the strictest examination? The business policy of the present associations and others in course of being formed bids fair to out-German the German. It is time the contractor made up his mind that, without combining, he will be squeezed out. Let every contractor help those who are determined not to submit to these injustices by joining the Contractors' Association, which has already done good work, and can do much more if backed by the whole of the contractors in the kingdom.

Contractor.

Instructions to Meter Readers.

May I suggest that Mr. Stubbings, in his otherwise thoughtful article concerning the "Do's and Don'ts" of meter readers, indicates insufficient appreciation of the commercial value which may attach to a consumer's conversation. It is, of course, extremely difficult to find the valuable combination of salesmanship and ordinary ability to read meters accurately, in the type of individual available to fill posts as meter readers; but I do firmly believe that, however polite may be a request that the consumer address his or her requirements of new work to the office, such request in very many cases would be directly responsible for opportunities of extended service being unhappily lost.

However lowly as an employé the meter reader may be regarded, I think that he or she should be definitely instructed in such a way as to enable appreciation of the valuable chances of further increasing the revenue of the supply undertaking concerned.

It would appear that, to carefully note in writing, and report to the office for attention of the sales department, the requirements of consumers, could be one of the suggested instructions with which your contributor concludes his article, without the disadvantage which, by some, might be thought to result from overlapping.

P. O. Wittey,

Staff Sergeant R.E.

B.E.F., France, September 29th, 1917.

War Bonus for W.O. Station Engineers.

Reading the small column in last week's REVIEW relating to a war bonus "under consideration for W.O. engineering staffs," I feel it my duty to state a similar case, but, being under the "Southern Command," I am one of those unlucky ones still working for a low pre-war wage, and not receiving any war bonus whatever, although I have been waiting for one since 1915, when a war bonus was granted. I have made several applications since that date for it; the answers have been: "It is coming through." The last answer, received a few weeks back, was, "Under consideration." Two years have passed, and they have only got to "under consideration": will it take another two years before they make up their minds?

We work the whole week through, Sunday included, and get no extra for it, but what we cannot understand is, that some of the staff have received the war bonus since 1915, and others not.

Is it not nearly time we had "fair play"? My fellow workman has received the war bonus since 1915. I have not: for what reason none of us can tell. Cannot someone wake things up?

Married Man.

UNION OF SOUTH AFRICA MUNICIPAL ELECTRICAL UNDERTAKINGS.

By E. POOLE, A.M.I.E.E., Assistant Borough Electrical Engineer, Durban.

(Abstract of paper read before the Engineering Section of the NATAL SOCIETY FOR THE ADVANCEMENT OF SCIENCE AND ART, at Durban, on August 28th, 1917.)

A FEW years ago the municipally-owned electrical undertakings of what is now the Union of South Africa could easily be counted on one's hands, and from a list I compiled in 1904 there were then only seven, viz.: Bloemfontein, Cape Town, Durban, East London, Johannesburg, Ladysmith, and Pietermaritzburg, while there were six towns which were controlled by private companies, viz.: Claremont, Kimberley, King William's Town, Newcastle, Pretoria, and Potchefstroom.

Durban, East London, and Pietermaritzburg were supplying electric tramways as well as lighting, while Cape Town tramways were supplied by a private company, as were also Port Elizabeth and Camps Bay.

To-day there are no fewer than 35 municipalities within the Union operating electrical undertakings, representing a total capital expenditure of about £5,500,000, including expenditure on tramways, with which Durban, East London, Johannesburg, Bloemfontein, Pretoria, and Pietermaritzburg are provided, as well as electric light.

There are seven other municipalities which purchase current in bulk from company undertakings, and generally carry out their own distribution work, a capital expenditure of about £170,000 having been incurred, including the expenditure in connection with the Boksburg and Germiston tramways. Four other municipalities have granted concessions to companies which control the whole of the electric light undertakings, the capital expenditure on which amounts to about £28,000. Other concessions are at Cape Town, Camps Bay, Port Elizabeth, and Kimberley, where there are privately owned electric tramways.

The grand total of units sold last year in all the various undertakings amounts to approximately 84,500,000.

Johannesburg, with over 25 million units, and Durban, with over 20 million units, sell between them slightly more than all the other towns put together, Johannesburg's increase over Durban being practically all taken up in extra tramway units.

Unlike England, electric lighting has practically the monopoly, there being no gas works other than in Johannesburg, Port Elizabeth, Cape Town, and Grahamstown; the former is the only town having both gas and electric municipal works, and the latter the only town with a gas company holding the monopoly.

Johannesburg has the largest output, having sold last year no less than 25,057,534 units, while Ceres has the smallest output, with an estimated sale of 9,000 units. To my mind it is the smaller towns we should encourage; in fact, there are only small towns left now, and their problems need just as much consideration in proportion as do the larger towns.

There are no Board of Trade Rules in South Africa, as in England, though these regulations are in the main observed, but the various Provinces of the Union have certain Acts which the electrical undertakings are subject to.

It is unfortunate that our electrical undertakings have no uniformity of plant, for we find all sorts of boiler pressures, engine and generator speeds, voltages and frequencies, &c. Also, in statistical returns we have no standard for such compilation. Some towns go very fully into these returns in their Mayor's Minutes, whilst others are very brief. In accounts we find all sorts of styles, so much so that it is almost an impossibility to make comparisons between one town and another. It is to be hoped that some day this will be rectified.

If uniformity had been aimed at more in regard to plant, the advantages would be manifold, for situated as we are here, some thousands of miles from the manufacturers, if a breakdown happens, we may find ourselves without the necessary spares, or if we are short of the ordinary run of material we have to wait a long time for it, and it is little use expecting our local suppliers to keep spares, or even hold stocks, of all the varieties of plant in use, seeing there are so many different voltages, sizes, &c., required. On the other hand, there can be very little interchange of plant between one municipality and another, even if one municipality were fortunate enough to have plenty of spares.

The chief source of power is steam, which is likely to be retained for some time to come. Of gas plants, the failure of the Johannesburg plant has no doubt caused a set-back in the adoption of such large plants elsewhere in South Africa, but we find some successful small plants operating. Diesel engines, using crude oil, are running with great success.

In water-power plants, Worcester and Aliwal North are partly dependent, and Cape Town has still a small supplementary water plant, but Ceres, Paris, and Paarl are the only towns entirely dependent on water. Unfortunately, water power in South Africa is generally out of court on account of its varying supply, for what are at one time raging torrents are merely small trickles at other times.

Coal is worked in all the Provinces of the Union, the largest producing area being the Middleburg district of the Transvaal, where it is of an average value of 12,673 B.T.H.U. The other Transvaal producing areas are Boksburg, Springs, and Heidelberg. In the Orange Free State we have the Vereeniging district, where the coal is of an average value of 10,626 B.T.H.U.

In Cape Colony the seams worked are in the Molteno, Cyphergat, and Serkstroom districts, but the coal is of poor quality. In Natal there are several districts where coal is worked, both north and south of the Biggarsberg, the average value south of the Berg being 13,079 B.T.H.U.

The finest South African coal, however, comes from the Hatting Spruit district, being as high as 14,306 B.T.H.U.

Outside the Union, in Rhodesia, we have the Wankie Colliery, where the coal has a value of 13,039 B.T.H.U.

Steam pressures are found to vary between 120 and 200 lb. per sq. in., while the price of coal varies from 8s. to as much as 23s. 6d. per short ton, and the pounds of coal used per unit varies from as low as 3.19 to as high as 16 lb. In the larger stations the water tube boiler of the Babcock & Wilcox type is chiefly to be found. The old style of boiler house, with its long range of boilers and one or more tall chimneys, is now becoming a thing of the past.

Turning to the smaller stations, boilers of the loco. type are principally to be seen, and may be looked upon as being best suited for small outputs. They are cheap in first cost, easy to install, very efficient, and can well be left in the hands of an Indian or native to operate.

The storage of coal and handling of coal and ashes has received due attention at the larger stations; the bin at Cape Town has a capacity for 3,620 tons. The class of coal used in some towns where there are mechanical stokers is that known as dross, which at one time was looked on as waste, the price per ton at the pit mouth being from about 1s. to 3s. per ton, as compared with the previously used round coal for hand firing at about 7s. 6d.

Of engines and generators we find quite a large variety, of many sizes; where a few years ago a number of small units were to be seen, these have been superseded by a few large units.

Speeds up to 3,000 R.P.M. are now common in turbines driving alternators; the first geared turbine in South Africa is at the Durban power station, where the speed is geared down from 3,000 to 428 R.P.M. The saving in large turbines is very marked, and we are able to obtain a result as low as 14.3 lb. of steam per unit as against 20 lb. in a reciprocating set. In the smaller steam stations the reciprocating engine of the high-speed vertical type still holds sway.

In the smaller stations atmospheric exhaust is often adopted owing to the lack of a water supply, as well as the necessity of keeping down the capital expenditure, though a saving of from 20 to 25 per cent. can be effected thereby with reciprocating engines. The question of water supply for condensing purposes is one of great importance. Few towns have a natural supply, the general practice being to use water from the town mains, in conjunction with cooling arrangements, though Johannesburg is fortunate in having five bore holes from which a good supply of water is obtained.

Of the coastal towns, only Cape Town and East London have taken advantage of the sea water by building their power stations near the wharves.

The Diesel oil engine, the type in use in this country, is looked upon as the best of its class. They are generally of the four-stroke type, in sizes up to 700 or 1,000 H.P., and vary in speed from 150 to 400 R.P.M.; above this power they are of the two-stroke single-acting type.

In generation we find examples of both direct and alternating current, the latter being three, two, and single-phase at various voltages and frequencies. In the larger towns we find—with only one exception—a mixture of D.C. as well as various phases of A.C. generation, but the smaller towns generally rely on the one source.

The exception in the larger towns is at Bloemfontein, where three-phase only is generated and distributed from sub-stations, while rotary converters in the power station convert the three-phase A.C. into D.C. for the tramway supply.

At Durban generation is D.C. for tramways and motor supply to private consumers, also single-phase as well as three-phase for lighting and power, the three-phase being used for Government bulk supply, large power consumers, the supply to the suburbs of Red Hill and Greenwood Park, and also for supplying rotary converters used to supplement the D.C. supply. It is also transformed down to two-phase, 2,750 volts, through sets of special transformers (Scott-connected), from which single-phase feeders are taken off and balanced between the two phases.

At Port Elizabeth generation is D.C. and three-phase, the latter operating motor converters to supplement the D.C. supply, and also supplying the outlying districts with A.C. single-phase D.T. distribution, as well as three-phase for large power consumers.

At Pietermaritzburg generation is three phase as well as D.C. and single-phase, the three-phase supply being supplemented by a motor-generator and rotary converter from the A.C. single-phase and D.C. supply respectively.

At Johannesburg generation is chiefly by two-phase turbo-alternators, with motor-converters for the D.C. supply for

lighting and tramways in the inner area, but there are also a few reciprocating generator sets for both the A.C. and D.C. supply. The two-phase also supplies the outer area with single-phase distribution for lighting, and D.C. supply through rotary converters in sub-stations for tramways.

At Cape Town generation is D.C. and A.C. two-phase 2,200 volts, with motor-converters from the latter source of supply converting to 440 volts D.C. for the old Cape Town area. The two-phase supply is also transformed up to 11,000 volts; three-phase, for the suburban distribution, and also for the supply to the railway works at Salt River.

In the smaller towns D.C. generation is practically universal. The exceptions are at Paarl, King William's Town, and Harrismith, the former town having made a wise and unique selection in A.C. three-phase at 3,300 volts, while the two latter towns have adopted A.C. single-phase.

The largest generators are in Johannesburg and Cape Town, being 3,000 kw. each. Durban is the only place where boosters are used to compensate for the voltage drop at distant points on the tramway track, while Cape Town uses them for keeping up the pressure on the L.T. lighting network.

Durban and Cape Town are the only large stations where a battery is installed, though in a few of the smaller stations batteries are provided with the object of being able to shut down the running plant during the hours of light load.

The universal practice is to earth at the power station the negative of a D.C. supply to tramways, and also to earth the neutral point in a three-wire supply. In A.C. single-phase working the side to which the outers of the outgoing concentric feeders are connected is always earthed, while in three-phase working with star-wound generators, the neutral point is sometimes earthed through a small resistance, which in the case of Durban is 8 ohms.

The latest type of switchgear as in use at the larger stations is the remote-control oil switch in cubicle form. At Pietermaritzburg there is a separate switchroom just off the engine-room, and at Johannesburg the switchgear is arranged on three floors. At Durban the switchgear is divided, that controlling the generators being mounted on a platform a few feet above the engine-room floor, while the outgoing feeder switchgear is in an adjacent room, where also are installed the boosters, converters, three to two-phase transformers, &c.

In Durban there is installed a special time-signal device which, by throwing a choking coil in the circuit at a time arranged (8 p.m.) lowers the voltage sufficiently for the consumers to observe, and thus their clocks can be adjusted, the time signal being given by the Post and Telegraph Department.

In the smaller stations supplying lighting only, one can hardly avoid the objectionable peak; in the larger stations, however, the introduction of motor load, cooking, tramways, electric vehicle charging, &c., has helped very much to flatten out the peak, and thus improve the load factor, which is highest in Durban at 44.8 per cent.

In connection with "daylight saving," if this is adopted Durban will be affected more than any other town in South Africa, owing to its geographical position, and the fact that approximately solar time is kept. The summer load factor under ordinary conditions works out at 32.39 per cent., but with the introduction of daylight saving it is raised slightly to 32.48 per cent.; 1,260 less units are sold during the 24 hours, representing a saving of two tons of coal for the day, with a loss of revenue of £18 a day.

DISTRIBUTION.

Generally speaking, the use of bare overhead mains is the common practice in South Africa. Some towns adopt it entirely; others have underground mains as well, but Harrismith and Aliwal North are the only towns where no overhead mains of any sort are used. There is no doubt that the use of overhead mains has in a very great measure helped the progress of electricity supply in South Africa on account of the great saving in first cost, as well as the accessibility to carry out repairs. The prejudice on the score of unsightliness and danger of falling wires is now practically non-existent.

The general practice in the case of feeders both for high and low-tension mains is to lay them underground, but in a few cases extra-high-tension as well as high-tension feeders are run overhead. With distributors, the practice in the larger towns is to lay them underground in the business areas, and overhead in the residential districts, and in the smaller towns they are mostly overhead bare copper (though at Worcester, aluminium wires are partly used), three-wire distribution being generally adopted, but Cape Town in some parts has five-wire distribution, and Paarl and Bloemfontein have four-wire.

In low-tension work the Siemens and the sectional type of steel pole are common practice, varying in height from 20 to 35 ft. in most cases, but on the coast there is an opening for a pole less affected by rust, and in the reinforced concrete pole we have an excellent substitute, which, while rather heavy to handle, has its advantages in life as well as in appearance.

The cross-arms in use are wood, channel iron, and tubular steel. Johannesburg has probably the largest low-tension network of overhead mains, amounting to no less than 191½ route miles. With overhead mains many arrangements are put forward to dissipate the effects of lightning, which is

very severe, especially in the towns of high altitude, and the use of earthed guard wires on the top of the poles has for a long time been looked upon as a safe precaution, in addition to the use of arresters on the lines at frequent points, though, of course, no device will avert a direct stroke. There are, however, one or two towns which have not taken these precautions, and opinion is still very divided on the subject. Apart from the fact of the earthed guard wire being a precaution against lightning, it is also advisable from a safety point of view, in preventing a pole from becoming dangerously charged owing to any of the mains coming in contact with same. The Government regulations provide that cradles or guard wires shall be erected under the mains at railway crossings and certain other places, but with good construction there is little to fear from falling wires, and frequently the precautions taken in this regard, as well as in the case of lightning, are more a source of trouble in themselves than a preventative.

With high-tension work, the bulk of the mains are laid underground, though in Johannesburg, Bloemfontein, Durban, and Cape Town a few of the routes are by overhead wires, Durban having extra-high-tension also for supplying the adjoining suburbs, and in the case of Bloemfontein the overhead H.T. mains are insulated wires. Durban is very fortunately placed in having practically the freedom of the whole of the roads for pole line construction, as the telephones are municipally owned as well as the tramways, the former being the one instance in South Africa, and with this one control many of the taller poles carry electric lighting wires on the top, telephone wires below, and under these the tramway span wires. In regard to the cost of overhead mains against underground mains, there is very little difference in the first cost of a circuit for high-tension work, using the best class of material throughout, but a great saving is effected when an additional circuit is required, as the cost of poles does not then come in for consideration. In low-tension work, however, there is a decided saving in favour of overhead mains, to say nothing of the saving in street-lighting and house-service costs.

Where underground mains are in use, the general practice is to use lead-covered, armoured and served mains laid direct in the ground at a depth of from 2 to 3 ft., but there are a few cases where they are drawn in through pipes or ducts, or laid in a trough filled in solid with bitumen. In Durban a charge of 1s. 9d. per yard of running trench is made by the roads department for reinstating after any excavations. Various dielectrics are in use, such as rubber, fibre, bitumen, and paper, and cables laid over 20 years ago with vulcanised rubber insulation seem as good to-day, as far as the rubber and wires are concerned, as when laid; but rubber cables are out of court on account of the price, and a very excellent type is the paper-insulated cable, which is universal the world over. Where at one time joints were made by screwed fittings in a cast-iron box filled up solid with special compound, the common practice now is to sweat it all up solid and insulate with tapes, after which a lead sleeve is wiped on, and in the hands of a careful plumber-jointer there is no more fear of a joint giving out than the cable itself. Too much attention cannot be given to the matter of joining all the armourings of the cable through and bonding them whenever opportunity offers to any rails or pipes. Faults on underground mains will, however, occur even with the best construction. By adopting a system of ring main and the free use of interconnecting switch pillars, great relief can be afforded, as the fault can then be localised between any two pillars, and at the same time supply can be maintained by the duplicate route that exists.

In extra-high-tension mains Cape Town has about 20 miles laid, with some routes at 11,000 volts, and Johannesburg has the longest routes of both high and low-tension, with 61½ miles of the former and 143½ miles of the latter.

(To be continued.)

Electrolytic Iron for Commercial Use.—The Société Le Fer, in France, has succeeded in producing electrolytic iron on so large a scale, in retorts absorbing as high as 20,000 amperes, that the Bouchayer and Viallet Works, at Grenoble, which hold a concession of the Society's patents, have already commenced the manufacture of pipes of large size from electrolytic iron. These are 4 m. long, 100 to 200 mm. in diameter, and 1.5 mm. in thickness (13 ft. long, 3.9 to 7.8 in. in diameter, .06 in. thick). These tubes are employed for various industrial purposes, such as conduits for water, steam, or compressed air. They have given entire satisfaction in practical use. Such a tube of electrolytic iron is said to possess the same strength as a tube of cast-iron 20 times as thick. The iron obtained by this process is said to be entirely different from ordinary iron, both in aspect and in properties. From the magnetic point of view it is possessed of a very high permeability and a low degree of hysteresis, making it particularly valuable for the manufacture of motors and transformers; from the mechanical point of view it possesses great strength and a considerable degree of extension. The tubes are expected to replace successfully the German tubes of which Mannesmann held a monopoly before the war.—*Scientific American*.

THE ELECTRICAL INDUSTRY AND THE WAR.

ON Tuesday last week Mr. J. S. HIGHFIELD, M.Inst.C.E., delivered an address, as President of the ASSOCIATION OF SUPERVISING ELECTRICIANS, dealing broadly with the conditions prevailing in the electrical and other trades in this country. He pointed out that the war was but a continuation of the trade war which was previously in active progress, and that, in addition, there had been excessive internal competition, particularly in some branches of the electrical industry; prices had been cut to a degree which compelled the reduction of quality of materials and labour, as well as low wages and inadequate profit. No trade could exist in a healthy state under these conditions; the best men would leave it, credit would be reduced, and capital would be withheld from it. Everybody had worshipped the fetish of cheapness without regard either to quality or to the general good of the community, or to the security of the nation, and, by this carelessness, the foreign suppliers were provided with an easy means of capturing many of our trades. The British customer who bought German wire and German switches before the war helped to build the German navy or weaken the British, because, even when the goods were supplied by the German at cost price or under, a certain amount of money passed to Germany, and at the same time some British were rendered less capable of contributing to the cost of our Navy. The foreigner supplied goods at these low prices only so long as the competition of the home manufacturer continued, the object being to carry on until the British manufacturer went out of business altogether. During this period some advantage accrued to the British purchaser, but as soon as the home manufacturer was driven out of business, the foreigner naturally increased the prices as much as possible, and then the British purchaser enjoyed his advantage no longer.

Unless British manufacturers held a very substantial part of the home market they could not take an active part in foreign trade. Therefore, one of the most important things to be done was to see that, in the future, the laws of this country should be such as to help them to manufacture for and to trade in a secure home market. The average purchaser would have learnt, before the war was over, that he should buy as far as possible articles of British make, and employ men of British birth, but this might not be sufficient, and then it would be for all of them to see that proper steps were taken to make sure that the desired end was accomplished, if necessary, by legislation.

They would agree with him that the capital invested in the electrical business had not earned sufficient profit, owing to the prices having been too low. To reduce prices before profits were obtained was a gamble. Their own particular branch of the industry had suffered from low prices, although he considered that the average standard of work was good; they must in future endeavour to make it a well-paid business, carrying out good work in sufficient volume to enable it to be done at low prices. Competition must be fair, and all the men in any trade should realise that they were working for a common end, and pull together.

There was no way so effective in improving design as the clear realisation of the defects of existing apparatus, and this could only be done by the men in actual daily touch with the difficulties; they could do a great service to the wiring business by collecting information about defects in the existing gear that they used, and by making suggestions as to the remedies they found necessary, and as to permanent improvements. A committee might be formed for this purpose.

Better wages were desirable, using the expression in the sense that the earner could get a better exchange, and with more work done by each man, and more men and women working, the desired result could be secured. This desirable result could be furthered by using standard designs, labour-saving machinery, and better skill in direction; but the one great essential was to secure a large and increasing market for labour, and the things it produced.

In addition to working for themselves, they would have, in the future, to work for all those who in the war had lost the power to keep themselves, and the women and children left by the gallant men who were no more. The sternest efforts were wanted to win the war, and winning the war meant not only conquering the enemy, but preserving a stable State wherein each man could, with his neighbour's assistance, lead a proper life, full of work, and with some comfort. The common credit of the nation had been used in this war with the most marvellous results; the same credit might be required to carry on successfully in peace. But credit must be paid for, or it vanished like a dream, and it was their business to consider how their trade could pay its share.

Electro-Galvanising.—MR. SHERARD COWPER-COLES has now erected at Sandbury-on-Thames one of his latest electro-galvanising plants, which embodies many important improvements and ensures an even homogeneous coating which is amalgamated with the surface of the iron. Mr. Cowper-Coles's process has been largely adopted by the Admiralty and various Government departments, also by several of our Allies.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

The Generation of Continuous Current by Turbines.

The practice of generating continuous current by the use of turbo-alternators coupled to rotary converters is rapidly extending. One of the numerous installations of this description laid down by the GENERAL ELECTRIC CO., LTD., is depicted in the accompanying illustration. This plant is installed in an important engineering works, and comprises a 1,500-KW. "Witton" turbo-alternator running at a speed of 3,000 R.P.M. and generating six-phase alternating current, which is delivered to two 750-KW. "Witton" rotary converters running at 600 R.P.M. and generating continuous current at 460 volts.

The installation has proved completely satisfactory, and has again demonstrated the utility of this method of generating continuous current, which enables the turbine to be run at a speed

FIG. 1.—1,500-KW. "WITTON" TURBO-ALTERNATOR AND ROTARY CONVERTERS GENERATING CONTINUOUS CURRENT.

at which the highest efficiency is attained, while at the same time the continuous-current commutators on the converters can be designed with a peripheral speed consistent with satisfactory working.

In the background of the illustration a 750-KW. "Witton" continuous-current turbo-generator set is seen, which has now been running for over ten years. This type of machine is now superseded for the generation of continuous current by the combination described.

The complete installation was laid down by the General Electric Co., Ltd., of Witton, Birmingham, and Queen Victoria Street, E.C.4.

B.T.H. Direct-Current Motors.

A range of D.C. motors of 0.15 to 10 H.P. at pressures up to 600 volts is described in a new list of the BRITISH THOMSON-HOUSTON CO., LTD., Rugby; the machines are fitted with commutating poles,

FIG. 2.—B.T.H. PROTECTED TYPE DQ MOTOR.

end-shield bearings, ventilating fans, and enclosed terminal boxes, and can be supplied as protected, enclosed ventilated, or drip-proof motors, while the larger sizes can be supplied as pipe-ventilated motors.

Fig. 2 shows the protected type, from which the others differ in

the design of the end-shield. The motors will stand overloads and are capable of shunt speed regulation up to 50 per cent. above normal. They can also be fitted with covers making them "totally enclosed," the rating then being modified. The armature windings are vacuum-impregnated, and are tested with 1,500 volts A.C. after the full-load heat run. The magnet frame is of cast-steel, the laminated poles being removable, with the field coils, without disturbing the armature, and the bearings are provided with oil-ring lubrication.

The Willard Accumulator Plate Separator.

We are able to give a few additional particulars of the new accumulator plate separator which has lately been adopted in the batteries made by the WILLARD STORAGE BATTERY CO., of Cleveland, O., U.S.A., and reference to which was made in a recent issue. Because of the fact that rubber forms an excellent insulating material, many experiments in the direction of using it as a plate separator have been made in the past. Punching holes in the rubber has not, however, proved entirely satisfactory, because if the holes were too small, the electrical resistance was high, while if the holes were large, small particles of the active material were likely to bridge the gap and short-circuit the plates. In the new Willard separator, the same idea is adopted, except that the holes are closed

FIG. 3. PHOTOMICROGRAPHS OF THE WILLARD SEPARATOR.

by a very large number of threads which act as wicks. In fact, it is stated that each separator is pierced by no fewer than 196,000 threads, $\frac{1}{32}$ in. long, and of a diameter so small as to be almost invisible to the naked eye. It is stated that the battery solution is drawn through these threads by capillary attraction and offers a free passage to the electric current, while at the same time presenting a solid face to the active material. It is not claimed that the new separator—for the manufacture of which special machines have had to be designed—will render the battery indestructible, or that it will permit neglect by the owner or user; the makers do, however, claim that the new separator tends to increase the capacity of accumulators to stand abuse and to lengthen their useful life.

WAR ITEMS.

Germany's Coal Shortage.—The "Times" states that owing to the dearth of coal Berlin householders are ordered to reduce lighting to an absolute minimum. Also that owing to lack of coal five towns in Bohemia are without electric light, and three without water.

Trading with the Enemy.—The "London Gazette" for September 28th contains a further list of persons and bodies in the following countries with whom trading is prohibited:—Argentina, Chile, Colombia, Netherlands and Netherlands East Indies, Norway, Peru, Spain, Sweden; also a number of variations in previous lists.

The One-Man Business.—Sir Auckland Geddes, Minister of National Service, last week received a deputation from the National Association of Business Men. A considerate hearing was given to the statement advanced concerning the calling-up for military service of the proprietors of "one-man businesses," and a further conference takes place later.

Exemption Applications.—At Southwark, Coun. T. E. Hewitt, a member of the Tribunal, who carries on business as an electrical engineer in Southwark Bridge Road, applied for the exemption of three sheet-metal workers, aged respectively 28, 27, and 23 years, and for a fitter and mechanic, 33, all passed for general service. He said the cases had been adjourned in order that he might obtain certificates under the Protected Trades Schedule. After some delay, an officer from the Department visited his works, and expressed his satisfaction, but stated they would be prepared to grant the certificates provided that the men would join as munition volunteers under the substitution scheme. If they did that

the Government would have the first claim on his men, and therefore he did not know how he should stand, as he would have to prove that the work on which they were engaged, although not for the Government, was of national importance. Mechanics and fitters were so badly wanted by the Government that there would be very little chance for him to keep them. He therefore came before the Tribunal for protection. He was prepared to release the two younger sheet-metal workers, provided they would permit him to retain the other two men. The remaining sheet-metal worker had been with him since he was a boy, and he would be the only man left in the department, where before the war he had 17 men. The fitter was the only one he would have left. He must at least have these two men to carry on. The two sheet-metal workers were instructed to join up by November 1st, and the other sheet-metal worker and the fitter were granted three months' exemption each.

At Bermondsey, the Tribunal unanimously adopted a resolution that, in view of the large number of men in low medical categories now appealing for exemption, they considered it would eliminate considerable hardship and increase the efficiency of the fighting forces if Class A men (general service), who were unmarried, between 18 and 25 years of age, were taken for military service in large numbers from munition works, and they urged the Government to take action in this direction.

At Batley Tribunal last week, H. Jagger, electrician, aged 37, married, whose medical examination had been postponed, submitted a communication from a Sub-Committee of the Ministry of Munitions, in reply to his application for a protection card under the list of protected occupations, stating that arrangements had been made for the issue of a certificate to the applicant. The Tribunal granted temporary exemption to November 1st.

Exemption was claimed at Windsor by W. J. Hetherington (38, Class A), electrician with Messrs. Martin & Co., on the ground that he was engaged on work of national importance. The Military Representative said that there was a very great need in the Army for electricians, and a man with appellant's knowledge was valuable. The appeal was refused, with a month's grace.

A Crawley firm applied to the Horsham Rural Tribunal for exemption for an electrician (31, B1), the only practical man left, and who had been medically rejected for the Volunteers on account of deafness. Three months were granted, with a fresh medical examination in the interval.

At Tunbridge Wells, A. T. Spurrell (C1), and A. E. Hills (B1), were appealed for by Mr. E. Powell, electrical engineer. The men are wiremen, and Mr. Powell said that they were engaged on work of national importance, and that they were three weeks' behind in their jobbing work. The Tribunal decided to have a report prepared with regard to all the electricians in the town, and the appeals were respite for this purpose.

Before the Wilts. Appeal Court, exemption was claimed for L. Horne (28, C2), electrician at Chute Standen, Andover. The appeal was refused.

At Bexley, the manager of the U.D.C. tramways (Mr. H. P. Stokes) appealed for conditional exemption of four motormen, one a discharged sailor. It was stated that the Council had taken over the working of the Dartford tramways, which meant extra work, while an efficient service for munition workers was necessary. Three of the men were given conditional exemption, and the case of the other, a Class A man, was adjourned.

At Hastings, the Tramway Co. appealed for the retention of a motorman (24, C3). Three months were granted, the man to join the Red Cross.

At Oxford, the Military applied for the withdrawal of a certificate of conditional exemption granted on March 13th, 1916, to H. G. Barrett (31, Class A), lately engaged with Messrs. Hill, Upton & Co., electrical engineers. When he left the firm his badge was taken away, and he was now ordered to join up in a month.

East Kent Appeal Court has granted exemption until November 6th to G. H. Hawkins, electrician at Denton Court Estate.

Guildford Tribunal has given a final month to W. H. Dann (33, C1), electrician at the County and Borough Halls.

New Zealand.—H.M. Trade Commissioner in New Zealand (Mr. R. W. Dalton) writes, under date July 25th, that owing to a recent labour dispute at Wellington, the gas supply for all purposes has been restricted, and this has led to a large increase of orders for the installation of electric lighting, heating, cooking, &c., appliances. Householders and business people turned to electricity as a substitute or stand-by for their various requirements; and electrical engineers and suppliers of electrical goods experienced a rush of business. According to the local Press, the sale of electric cookers, heaters, kettles, smoothing irons, &c., constituted a record, and, further supplies of such articles being difficult to obtain, stocks are now low. For some time past the only market open to New Zealand buyers for the purchase of electrical goods has been the United States, but now even that source is becoming uncertain.—*Board of Trade Journal*.

DAMAGES ON FAILURE TO COMPLETE A CONTRACT.

[BY OUR LEGAL CONTRIBUTOR.]

THERE is little doubt that the exigencies of the times have given rise to a large number of cases in which those who sell or buy machinery have been compelled for one reason or another to commit breaches of contract.

A manufacturer may have given a large order for electrical machinery before or in the early days of the war. Suddenly, through the intervention of the Ministry of Munitions, the normal course of business at the factory of the buyer is entirely altered. He is unable, or unwilling, to take delivery. Assuming that the prospect of matters being interfered with by the Government was not provided for in the contract, what are the rights of the parties?

With a view to assisting those who are in the position of persons whose contracts have been broken, it is proposed to examine the decision in a case heard in the Court of Appeal. It involved consideration of the apparently simple problem: What is the measure of damages when a trader fails to take delivery of machinery which he has ordered? As a general rule, of course, the failure to take delivery is due to "failure" in the larger sense; and if that is the case, the trader must fain be content with whatever dividend may be paid in the bankruptcy.

Let us assume the occurrence of a case in which the property in the goods has not passed to the buyer. If the property has passed the remedy is obvious; the seller can sue for the whole amount due without deduction of any kind. But if there has been a mere failure to take delivery, the damages must be assessed on certain well-recognised principles. If there is a ready market for the goods, little difficulty arises. Suppose a man had undertaken to deliver a machine on March 1st for £100, and the purchaser were to announce on February 25th that he cannot take delivery. If the buyer was able to find another person willing to buy on March 1st for £100, it is clear that the seller would suffer no loss, and no damages would be awarded to him by the Court. But if he were only able to sell for £95, his damage would be £5, and so on. Now, take the case where there is no available market, and the goods are thrown on the seller's hands. In that case the damage which he sustains might be very much more severe. Indeed, it is possible to conceive a case where, in the event of a purchaser failing to accept delivery of a piece of machinery of a highly special type, its only value to the seller when thrown on his hands would be the value of old iron.

A case in point is in *re Vic Mill, Ltd.* (1913), 1 Ch. 465. The Vic Co. had ordered certain machines to be made by Messrs. Arundel & Co., a firm of engineers. The order having been given, the company went into voluntary liquidation, and were unable to accept delivery. The engineers, as creditors, put in a claim in the liquidation for the profit which they would have made had they been allowed to deliver. Upon this basis, they claimed £167 13s. 6d. As the liquidator rejected their claim, the registrar of the winding-up court was called upon to inquire what was due. As the various machines embodied in the order were on a slightly different footing, it is necessary to inquire what they were. They were in two classes. Class I consisted of four quick-traverse winding frames, which had been completed before the date of the winding up. These were retained by the engineers, and were then somewhat altered and sold to other customers at a price less than the contract price. Class II comprised machines which would have been wholly or partially manufactured by the engineers, on which they had done no work, but for some of which they had purchased subordinate parts ready made, which they afterwards used in fulfilling other orders. The loss of profit claimed on Class I amounted to £162 19s., and on Class II to, roughly, £1,000. The engineers claimed the whole of this. As regards the winding frames, the registrar found that they had been altered at a cost of £5, and resold at a price which was £23 less than the amount the company had agreed to pay. He therefore awarded £28. As regards the machines in Class II, they would be for the most part built up out of stock. There was no evidence that the engineer's works had been wholly or partially stopped in consequence of their not manufacturing these machines, or that the orders on which they were engaged were less remunerative than those under consideration. The registrar held that though prospective profits must be taken into account, it could not have been as much as £1,000, and awarded £250. The judge to whom the registrar's finding was referred over-ruled him, and declared that the engineers were entitled to the loss of profit as they had themselves estimated it, and the Court of Appeal confirmed the judge's decision.

The judgment of Lord Justice Hamilton in the Court of Appeal is very instructive. He said, as to the goods in Class I:—"The registrar thought he had evidence to the effect that the loss was only £250, but he had none. Consequently his assessment of £250, though not in itself surprising as a matter of business, was one unsupported by any evidence

before him. It is true that there is no evidence that the creditor's works were wholly or partially stopped in consequence of their not manufacturing these machines. If that had been so there might have been a claim for some proportion of the overhead charges attributable to the period when the works were at a standstill, when charges were running on, and nothing was being made against them, because the appellants, the buyers, would not perform their contract. It is true that he found that there was no evidence that the orders on which the works were employed were of a less remunerative nature than the orders in respect of which the claim for damages was made. Had that been so, it might have been an alternative means of measuring the damages—that, whereas during such and such a time they would have been working at a profit of 35 per cent. on their turnover, they were obliged to work for somebody else, and could get no more than a profit of 30 per cent. The affidavits fairly read show that the claimants' works were sufficiently large, and their equipment sufficiently ample, to enable them to perform this contract in addition to all the others that they did perform. . . . As the evidence stands, there was a *prima facie* case that the makers could have made this profit as well as the profits on all the other contracts they had. There was not only no evidence to rebut that, but no suggestion to the contrary was made in cross-examination. It is tolerably clear that the point really fought was whether or not there was an available market in which the goods might have been sold—a point which disappears by the admission that there was no such available market."

Dealing with the winding frames, on which the engineers claimed £162 19s. for loss of profit, his Lordship pointed out that there the duty of the engineers in the circumstances was to act reasonably. There was no available market. If the goods had been broken up, or sold by auction for what they would fetch, the consequences to the buyers would have been worse than they were. He then proceeded:—"It so happened that, after the repudiation by the Vic Mill, another customer of the makers was prepared to place an order with the engineers for frames of that kind, and somewhat of those dimensions. They might have taken that order, fulfilled it, made their profit on it, and dealt with the frames left on their hands in any reasonable way they chose. They did, in fact, at a small cost, adapt the frames on their hands, and with them fulfilled the order of this other customer, and so made their profit on his contract. To that extent the buyers in the present case got the benefit of the accident that another customer came forward. That was a reasonable mode of mitigating the damages, but it by no means follows that the damages are confined to the cost, a trivial one, of adapting the machines to the needs of the second customer, and the loss on re-sale to him, which was only £23, making £28 in all. The fallacy of that is in supposing that the second customer was a substituted customer, and that, had all gone well, the makers would not have had both customers' orders, and both profits. In fact, they did, acting reasonably, and, I think, very likely more than reasonably in the interests of the Vic Mill, content themselves with earning the profit on the second contract at the cost of adapting the machines, which has been taken at £5; but they are still losers of the profit which they would have made on the Vic Mill contract, because they could, if they had been minded, have performed both contracts, and have made profits on both the contracts but for the breach by the Vic Mill of their contract."

In the result, the Court of Appeal held that the engineers were entitled to the full amount claimed.

A discussion of the converse case may also be instructive. Suppose that a manufacturer has undertaken to deliver machinery, and, owing to reasons which he cannot control, but for which the law holds him responsible, he supplies an inferior article. What is the measure of the damages which he must pay?

The case of the British Westinghouse Electric and Manufacturing Co., Ltd. v. Underground Electric Railways Co., which was decided by the House of Lords in 1912, involved a discussion as to the measure of damages where the manufacturer has failed to provide a satisfactory machine. The material facts may be very briefly stated. In 1902 the British Westinghouse Co. (who may be conveniently referred to as "the claimants") contracted to supply certain steam turbines and turbo-alternators to the Underground Electric Railways Co. (hereinafter called the respondents) for £250,000. Payments were to be made by instalments from time to time. Eight steam turbines and eight motor generators were delivered from 1901 to 1906, the respondents paying £159,439 3s. 2d. on account of purchase price. In spite of certain agreed reductions, a large balance of the purchase price was still outstanding when the proceedings presently referred to were commenced. All the machines proved to be defective in design and efficiency, and failed to comply with the contract and specifications, but the respondents, while reserving their rights, continued to use them for supplying power to their railways. In 1907 the claimants, with the consent of the respondents, who still reserved their rights, removed and experimented with one of the machines, with a view to seeing whether it could be put in order, but the experiments failed. Finally, the respondents made arrangements to substitute for the claimant's turbines "Parsons machines," of different design and manufacture.

The claimants having sought to recover the unpaid balance of the purchase price, the matter was referred to arbitration. At the hearing before the Hon. Alfred Lyttelton, the respondents counter-claimed damages, and alleged that, as part of the damages, they were entitled to the sums expended on the Parsons machines, as the purchase of those machines "mitigated or prevented the loss and damage which would have been recoverable from the claimants if the respondents had continued to use the claimant's defective machines in the future." The claimants, on the contrary, alleged that as the commercial life of their machines had expired at the date of the purchase of the Parsons machines, no further damages were recoverable from them after the date when the Parsons machines were procured. The arbitrator stated a special case for the opinion of the Court upon these questions. The Lord Chief Justice, after reviewing the facts above set forth, said: "*Prima facie*, it seems to me the questions to be considered as to the measure of damages are: (1) What would be the natural life of a properly constructed machine; and (2) what would be the damages for having to work the defective Westinghouse machines. If the respondents had not put in the Parsons machines, the measure of damages would have been much larger. When a man is relying on breach of contract, he must do what is reasonable not to make the damages greater than they would otherwise be. Here the cost of the Parsons machines is a matter which the arbitrator must take into consideration. It would not be right to adopt the contention that because Parsons machines had so much improved in 1908, 1909, and 1910, the Westinghouse machines had come to an end of their commercial life."

What he found is stated by Lord Haldane in his judgment in the House of Lords (1912, A. C., at p. 688), where he says:—"The arbitrator appears to me to have found that the effect of the superiority of the Parsons machines and of their efficiency in reducing working expenses was, in point of fact, such that all loss was extinguished, and that actually the respondents made a profit by the course they took. They were doubtless not bound to purchase machines of a greater kilowatt power than those originally contracted for, but they, in fact, took the wise course in the circumstances of doing so, with pecuniary advantage to themselves. They have, moreover, used the appellant's machines for several years, and had recovered compensation for the loss incurred by reason of these machines not being, during these years, up to the standard required by the contract. After that period, the arbitrator found that it was reasonable and prudent to take the course they actually did in purchasing the more powerful machines, and that all the remaining loss and damages was thereby wiped out."

This case affords a striking illustration of the statement (which so often shocks the non-legal mind) that law is the embodiment of common sense. The railway company did what must, in practice, have been their imperative duty. The machines having failed, they were bound to keep their trains running. Instead of tinkering with old plant, they bought of the very best, with the result that their position both present and future was vastly improved. As the damages in the long run were thus reduced, they were not allowed to recover them from the Westinghouse Co. The case serves to remind one of that principle of the law of contract which says that a man whose contract is broken must not sit down under his loss. For instance, in the case of a sale of goods where the buyer refuses to take delivery, the seller is bound in all cases to take any reasonable steps which are open to him to reduce his loss, and if it is shown that upon the occurrence of the breach the seller might have gone into the market and sold to better advantage than he could have done by waiting until the contract date for delivery, his damages may, it seems, be reduced accordingly.

BUSINESS NOTES.

Book Notices.—"The Housing Question as Affected by Recent Legislation." Reasons for Repeal of Part I of the Finance (1909-10) Act, 1910. London: The Land Union. Price 1s.

"Electrical Measurements." By F. A. Laws. London: Hill Publishing Co. Price 21s. net.

"Principles and Practice of Electrical Engineering." By A. Gray. London: Hill Publishing Co. Price 12s. 6d. net.

Bankruptcy Proceedings.—F. BROWN, electrician (formerly a partner in Hugh Bros. & Brown), Llanelly. Trustee released September 21st.

Liquidations.—NAYLOR BATTERY CO., LTD.—A meeting is called for October 31st to hear an account of the winding up from the liquidator, Mr. H. Everett.

ALFRED HERBERT (FRANCE), LTD.—A meeting is to be held at Coventry on November 8th to hear an account of the winding up from the liquidator, Mr. D. M. Gimson.

M. & G. TRUCK & ENGINEERING CO., LTD.—A meeting is called for November 13th, at 124-127, Minories, London, E.C., to hear an account of the winding up from the liquidator.

Catalogues and Lists.—MESSRS. BOVING & CO., LTD., 56, Kingsway, London, W.C. 2.—New pump catalogue of 52 pages, containing particulars of the general design and types of their

pumps. Excellent half-tone pictures accompany the descriptions of low-pressure, medium-pressure, and high-pressure pumps, also medium-pressure pumps for hydraulic mining, and stationary and sinking vertical pumps. The firm has made extensive arrangements for testing in the presence of clients. We understand that at the present time the total output of the driving motors for the firm's high-pressure multi-stage turbine pumps is above 15,000 H.P.

MESSRS. PASS & SCAVOIR, Inc., Solway, New York.—80-page illustrated and priced catalogue of their handy electric wiring devices.

MESSRS. PECKHAM, DUCAMP & CO., 90, Charing Cross Road, London, W.C. Eight-page illustrated price list of Osram lamps of various types, &c., showing advanced prices for a number of lines.

Sterling Football.—On Saturday last, on the grounds of the Sterling Athletic and Social Club at Dagenham, Essex, football matches were played on behalf of the St. Dunstan's Hostel. In the Ladies' Match, "Sterling v. Brocks," the Misses Joy and Crystal Burney "kicked off" at 2 p.m., and at 3.30 "Sterling v. Clarence" (the East and South-East London Munition Workers' Football League Match) was played. In the first match "Sterling" scored 4 goals and Brocks 0, and in the second the scoring was "Sterling" 4 and Clarence 2. Mr. Guy Burney, the managing director of the Sterling Telephone and Electric Co., Ltd., has been elected a vice-president of the East and South-East London Munition Workers' Football League.

LIGHTING AND POWER NOTES.

Aberdeen.—In his annual report, Mr. Bell, the city electrical engineer, refers to the considerable increase in the industrial use of electricity in the area, and mentions that an electric steel furnace will shortly be in use in the city. In three years the department has handled a 78 per cent. increase in motor H.P. connected, and the power units sold last year (9,250,000) represent a 97 per cent. increase on the previous year, some 14,000 H.P. of motors being supplied. The lack of railway connection for coal supply, which was planned when the works were laid out, has been acutely felt, and it is noted that about 15s. 3d. in the £ in works costs is due to coal. It is interesting to note that the 14,000 H.P. of motors now supplied represents about 42½ per cent. of the estimated power requirements of the present area of supply. The local shipyards are now considerable power users, and about 1,405 electrical utensils for heating and cooking were hired out by the department. It was found necessary to extend the buildings for a new 5,000-KW. turbine set, and new substations have been provided in York Place and Torry. It is noted that the 3,000-KW. turbine set, since it was installed in 1913, has generated 44,378,000 units out of the total of 50,914,000 units generated in the station; a 500-KW. converter has been delivered for the York Place sub-station, and a 350-H.P. electrically-driven pump is being erected at the generating station. The plant capacity of the generating station is 7,760 KW., and the maximum load was 6,162 KW., the load factor being 26 per cent. The year's working resulted in a small deficit (£345); the charges were, however, reduced by 5 per cent. on the previous year, and a serious increase in working costs was met. The reserve fund stands at £39,304.

Bacup.—PRICE INCREASE.—The Corporation electricity department announces that, in consequence of the increase in the price of coal and other charges, the charges for current supplied will be increased from January 1st. For lighting the advance will be 10 per cent. and for power and heating 15 per cent. Consumers who have a coal clause in their agreements will not be affected.

Blackpool.—VEHICLE BATTERY CHARGING.—The Electricity Committee is considering the report of the engineer (Mr. C. Furness) on the desirability of installing a motor-generator and switchgear at the electricity works to meet the forthcoming demand for charging electrical vehicles.

The output of electricity for July and August reached 949,464 units, an increase of 21,918; and for the year to the end of August the increase was 199,515 units.

Bolton.—PROPOSED LOAN.—The Electricity Committee has approved a report of the electrical engineer as to the proposed plant extensions at the Back-o'-th-Bank generating station, and has decided to request the Finance Committee to make application to the L.G.B. for sanction to borrow £60,000 for carrying out the work. The extensions have been rendered necessary owing to the increased demand for electrical power.

Bournemouth.—PRICE INCREASE.—After conference with the Bournemouth and Poole Electricity Supply Co. as to the revision of the rates chargeable for the supply to the Corporation, an increase of 22½ per cent. has been recommended.

Bradford.—PRICE REVISION.—The Electricity Committee has now adopted a resolution under which, in addition to other revisions, a 10 per cent. increase will apply to the flat rate consumers. The recommendations, as now to be submitted to the Council, are:—Power consumers having maximum demands of under 5 KW. and power consumers on the restricted hour rate shall pay an additional amount in accordance with the price of coal on the same basis as power consumers having maximum demands in excess of 5 KW. (At present, this means an addition of 20 per cent.) The accounts of all other classes of consumers which are not subject to adjustment in accordance with the price of coal

(with the exception of the tramways department) shall be increased by 10 per cent. For heating and cooking purposes current shall be supplied at a flat rate of 3d. per unit, plus 10 per cent. to consumers who are already taking supplies of electricity for other purposes at the premises for which the supplies for heating and cooking are required.

Castlere (Co. Roscommon).—E.L. PROPOSALS.—A meeting of residents has formed a Committee to take steps for the introduction of public electric lighting. The cost is estimated at £2,000.

Chatham.—PRICE INCREASE.—The Kent Electric Power Co. announces that the price of electricity will, as from October 1st, be increased to 6d. per unit for lighting, and 1½d. per unit for power; to £1 2s. 6d. per quarter for radiators, and special rates by 10 per cent., subject to the existing advance of 33½ per cent.

China.—According to an American Commerce Report, the city of Amoy, the island of Kulangsu, Chioh-be, Changechow, and Chuanchow are all equipped, or being equipped, for electric supply. The Amoy Electric Light and Power Co., a Chinese concern, installed two 100-kw. turbine plants and two water-tube boilers, with a three-phase, 60-cycle, 2,300-volt transmission and 110-volt house service by means of transformers near customers' premises. In 1915 a 300-kw. turbine set was added, with two additional boilers. A total of 16,000 16-c.p. equivalent lamps is supplied and 300 fans are on the circuits, as well as 400 street lamps of 16 c.p. size, a number which is to be increased to 600 in the near future.

On Kulangsu Island, a British concern runs a 75-kw., 220-volt A.C. plant, which is, however, overloaded, and a Japanese company is understood to be seeking to put in a plant.

At Changechow a Chinese company, the Chagma Electric Light and Power Co., has been organised to put in 50-kw. and 30-kw. gas-engine driven sets; the supply will be at 440-220 volts, direct current. At Chioh-be the plant consists of two 37-kw. generators, to supply at 220 volts, 3,700 16-c.p. lamps; Chuanchow has a 75-kw. gas-driven set, supplying at 110 volts, direct current, some 3,000 lamps, and it is understood a 150-kw. generator is to be added to the equipment, which is all Japanese.

Other cities in the Amoy district and Fukien province are discussing similar plants, for which the Japanese, who have adopted the extremely liberal credit system of the Germans, are strong competitors.

Continental.—RUSSIA.—It is reported that the employees of the Kharkov E.L. Co. recently arrested the directors and managers of that concern, having decided to imprison them until higher wages were granted.

Darwen.—The borough electrical engineer, town clerk, and Councillor Thornley have been appointed to represent the Council at any meetings held in connection with the suggested inter-connection of the various electrical undertakings in East Lancashire.

Dover.—The installation of prepayment meters is to be discontinued, as the supply with them in face of the high price of meters does not give a profitable return.

East Ham.—YEAR'S WORKING.—For the year ending March 31st last, the gross profit on the electricity undertaking was £4,667, against £6,266 in the preceding 12 months. The decrease is represented by £1,896 increase in expenditure, less £297 increase in income. After paying interest on loans, &c., there was a deficiency of £244, as compared with a profit on the previous year of £1,902. The deficiency at the close of the year, including the deficit brought forward from previous years, and allowing for the balance of depreciation of renewals fund, was £3,606.

Epsom.—TAR OIL.—On the recommendation of the acting electrical engineer, the U.D.C. has decided to convert a Diesel engine for burning tar oil, which can be obtained at £5 14s. per ton, against from £10 11s. to £17 11s. per ton. This will save £1,000 a year.

Halifax.—WAGES.—The Corporation employees in the electricity, gas, highways and other departments, who are at present in receipt of wages 9s. a week higher than pre-war rates, have put in an application for payment which will bring them to 15s. a week above pre-war rates, and also ask that, in the event of any further increase of wages being conceded to the engineering industry, the same wages shall be given to the Corporation employees. The Finance Committee recommends that the application be declined, as the question of wages was referred to, and decided by the Committee on Production, last month.

Haslingden.—The electricity department made a loss of £298 during the last financial year, instead of the estimated profit of £200.

Hlford.—LOAN APPLICATION.—Application is to be made to the Treasury for a loan of £5,792, the first repayment instalment falling due one year after the termination of the war. The General Electric Co., Ltd., whose tender has been accepted for two 250-kw. rotary converters, insisted on the insertion of a clause in the contract providing for the adjustment of the amount in the event of the manufacturing cost being increased as a result of direct instructions from the Government. The clerk was directed to communicate with the L.G.B. on the matter, intimating that should such an event arise, the Council will anticipate the Treasury reimbursing the Council the extra cost so incurred.

India.—According to *Capital* (Calcutta), of August 3rd, the disappointing quality and quantity of supplies of coal in the

North and West of British India has caused consideration to be given to the possibilities of using hydro-electric power as a substitute in industries and undertakings. At Bombay motive power is obtained from the Western Ghats, and in the Punjab it is proposed to obtain water power from the canals. The Bombay undertaking already provides the mills of Bombay with about 40,000 electric H.P. The undertaking is being extended, and is expected to supply all the power required by the Bombay mills, tramways, and Port Trust railway, as well as to provide for the lighting of the city.

The hydro-electric plant at Amritsar, which has been set up recently by the Punjab Irrigation Department, is a similar project, but on a much smaller scale. At present the power is made use of to irrigate fields for agriculture, and to drive machinery in one of the workshops of the Irrigation Department. It is expected that this irrigation from wells will reduce at the same time the subsoil moisture, and so make the city less malarious.

Not only is it probable that, in regions where coal is scarce in British India, hydro-electric power will supplant steam to a large extent in the conduct of industry, but, if the price of Indian coal continues to rise, as is expected, it is also likely that electricity will be generated from coal on a much larger scale than hitherto in all the large towns of India, and utilised for public and domestic services as well as for industries.—*Board of Trade Journal*.

Kirkheaton.—PROVISIONAL ORDER.—Having received notices from the Huddersfield Corporation and the Electrical Distribution of Yorkshire, Ltd., of their intention to apply for a provisional order authorising them to supply electricity within the urban district, the U.D.C. has decided to invite representatives to meet the Council to discuss the matter.

London.—HACKNEY.—YEAR'S WORKING.—The report of the Corporation electricity undertaking for the year ended March last shows a total sale of 15,302,372 units, or nearly 69 per cent. increase on the previous year; this large increase was due mainly to power supply, for which some 12½ million units were sold; bulk supply to Poplar also accounted for 748,000 units, but in other directions there was a falling off. Altogether 18 million units were generated, and about 35,000 purchased from Poplar under the interconnection arrangement. The total revenue for the year was £88,050; the total expenditure, £50,478; and the gross balance £37,572, as compared with £24,252 in the previous year. Loan charges amounted to £30,032, and there was a surplus of £5,290 as compared with a deficiency (the first recorded on a complete year) of £8,265 on the previous year. The reserve fund at March 31st amounted to £25,340, after charging thereto the loss, £4,774, in respect of a breakdown to a 600-kw. set.

It is remarked that the large scheme of extensions was completed early in the year, and the effect of the efficient plant is shown in the cost of energy: working and management cost amounts to 75d. per unit, as against 84d. in the previous year, while the all-in cost, 1'23d. per unit, is the lowest yet recorded. The decreased average cost is, of course, also due to the increased power supply, some 1,491 motors of 12,370 H.P. being connected, as against 1,381 motors of 8,770 H.P. in 1915-16. Roughly 16 million of the total units generated were A.C.; the maximum load was 7,951 kW. and the load factor 22 per cent.

BETHNAL GREEN.—The B.C. has received sanction from the L.C.C. to the borrowing of a sum of £1,000 for the provision of further house services in connection with the electricity undertaking on the usual condition.

The B.C. has been recommended to add 33½ per cent. to all consumers' accounts in respect of electrical energy supplied from October 1st.

Manchester.—PROPOSED LOAN.—The City Council is being recommended to apply to the L.G.B. for sanction to borrow £20,000 for additional electricity mains, due to the demands of consumers engaged on special work.

Preston.—The National Electric Supply Co. has notified consumers that in future the minimum consumption of current chargeable per quarter is to be 25 units.

Rathmines.—YEAR'S WORKING.—The year's working of the Council's electricity undertaking for the year ended March 31st last shows a total revenue of £15,762, a total expenditure of £10,003, and a gross profit of £5,759. Interest and sinking fund charges amounted to £7,678, leaving a deficit on the year's working of £1,919, which with £1,157, the debit balance brought forward from the previous year, makes a total deficit of £3,076.

Stalybridge.—COAL CLAUSE.—The Joint Electricity Board has decided that the coal clause for power supply shall be raised from 15d. to 2d. from January 1st next.

Stoke-on-Trent.—LINKING-UP.—In connection with the proposed linking-up of Stoke, Newcastle, and Leek for electricity supply purposes, the Stoke-on-Trent Electricity Supply Committee has authorised the engineer to prepare a scheme, jointly with the engineer of Newcastle-under-Lyme, upon that authority confirming the conclusions arrived at by the respective chairmen and vice-chairmen.

Templemore (Co. Tipperary).—PROPOSED E.L.—At a meeting of the Urban Council, Mr. McDonnell gave notice to move that a public electric lighting scheme be adopted.

Todmorden.—SUGGESTED BULK SUPPLY.—At the last meeting of the T.C., it was reported in connection with the Council's application to the L.G.B. for sanction to borrow £10,000 for extensions at the electricity works, that the Ministry of Munitions had replied suggesting linking-up with a neighbouring power station.

Walthamstow.—The Finance Committee of the U.D.C. recommends that the recommendation of the Electricity Supply and Lighting Committee be amended so that the charges for current supplied for public and private lighting be increased by a further 13½ per cent., making 33½ per cent. in all, and for power and heating by a further 15 per cent., making 40 per cent. in all.

It is proposed that prepayment consumers be charged an equivalent of a further 5 per cent. upon the sum taken from the meter. The electrical engineer is to enter into negotiation with those consumers who have period contracts, with a view to their paying an increased price for energy without prejudice to the terms of their contracts.

Wharfedale.—Mr. Woodhouse, engineer to the Electrical Distribution of Yorkshire, Ltd., waited upon the Guiseley District Council, last week, in reference to the company's proposed application for a Provisional Order; he said arrangements had already been come to with Rawdon and Otley, and the company were now approaching the Burley-in-Wharfedale Council and the Wharfedale Rural Council, the latter in respect of Menston. Mr. Woodhouse stated that the conditions had so greatly changed since the time of the agreement with Otley that he could not give an undertaking as regards the terms to Guiseley without consulting his directors.

TRAMWAY AND RAILWAY NOTES.

Australia.—The N.S.W. Government, after consultation with the Railway Commissioners, has decided to increase the fares on the Government tramways; whether this will be done by shortening the length of the sections, or by raising the fares on those already in existence, has not been decided. The latter is considered the most probable, as the Commissioners recognise that businesses have grown up around long recognised tramway sections, which they would be sorry to disturb.—*Sydney Evening News*.

Blackpool.—On the recommendation of the general manager (Mr. C. Furness) the Tramways Committee has authorised the provision of new cross-overs from west to east on the tramway immediately opposite the North Pier. The work is to be proceeded with during the coming winter.

The Tramways Committee has approved a scheme for the doubling of the track between the Hippodrome and Abingdon Street, including the erection of an ornamental shelter at the junction of Abingdon Street and Church Street.

The Tramways Committee has also agreed to the erection of a combined tramway shelter and bureau, with clock tower, opposite Foxhall Square.

Doncaster.—CHEAP TICKETS ABOLISHED.—The Corporation has decided to abolish all workmen's dinner tickets, coupons, and other cheap return tickets on the tramways, owing to increased working expenses, higher wages, and cost of material.

East Ham.—YEAR'S WORKING.—The gross profit of the Corporation tramway undertaking for the year ended from March 31st last was £4,493, which showed a decrease on the previous 12 months of £6,094, made up by £2,774 decrease in income, plus £3,320 increase in expenditure. At the close of the year, after charging interest and repayment of loans, there remained a deficiency of £2,395.

Haslingden.—YEAR'S WORKING.—There was a profit of £495 on the working of the tramway undertaking for the past financial year, after paying £308 to the Accrington Corporation in view of the latter's deficit.

Hebden Bridge.—A conference is to be held between representatives of the Halifax Corporation, the Todmorden Corporation and R.D.C., and the Hebden Bridge U.D.C. to consider the proposal to join up the Halifax tramways with the Todmorden Corporation motor-buses.

Hove.—The Board of Trade has extended to August, 1918, the time under the Corporation Act for the completion of overhead equipment and other apparatus for working trolley vehicles on certain routes.

Ilford.—The tramway manager having been appointed on a Sub-Committee of the Municipal Tramways Association to consider the standardisation of overhead equipment, informed the Tramways Committee of the Council that he was the only member of the Sub-Committee in the South of England, and the meetings would probably be held in Yorkshire; permission to attend these meetings was given.

Lancashire.—TRAMWAY WAGES AWARD.—The award of the Committee on Production in last week's arbitration between 19 Lancashire and Cheshire tramway undertakings and their employes has been received during the week end, and the result is another substantial increase of war wages for the 17,000 to 20,000 tramway workers affected, involving a big extra charge upon the local undertakings. The whole of the workers, male and female, over 18 years of age, will receive an advance of 3s. for a six days' week, and those under 18 obtain 1s. 6d. The total war advances for a six days' week is now 12s. for men, 9s. for women, 5s. 6d. for boys under 18, and 4s. 6d. for girls under 18. The award makes the bonus payable for overtime as well as for the ordinary working wages, as owing to shortage of staff a large amount of overtime is being worked; this is welcomed by the workers. The award

takes effect from the first pay day in September. The towns concerned in the increases are Manchester, where nearly 5,000 workers are affected; Salford, where the increased charge is estimated at £9,000 a year; Accrington, Ashton-under-Lyne, Blackburn, Birkenhead, Bolton, Burnley, Bury, Colne, Darwen, Oldham, Preston, Rochdale, Stockport, Wallasey, Warrington, Wigan, and the areas covered by the Stalybridge Joint Tramways Board and the South Lancashire Tramways Co. A leading tramway official in Manchester declares that as the advances will mean a big strain upon the departments, the possibility is that there will be a general increase of tramway fares throughout Lancashire.

Leeds.—Interviewed, last week, in regard to the Coal Controller's suggestion that economies might be effected by curtailment of some public services—as, for instance, early and late cars—Mr. J. B. Hamilton, the general manager, stated that the service there had already been curtailed so much that further steps in that direction were hardly likely, and it was at the instance of the authorities that special early morning and late evening cars were running. The whole question of the service, both as to number of cars and the number of people who drive and conduct them, was now engaging the attention of the Committee. The present service was not quite adequate for the number of people who wish to travel.

London.—The L.C.C. is making the following modifications in the availability of transfer and workmen's tramway tickets, commencing on October 3rd:—

1. Transfer tickets will only be issued for journeys where no through cars are run. Passengers who can make their journey without a change are requested to take a through car. Passengers who hold transfer tickets must change at the point indicated on the fare bills; such tickets will not be accepted at other points.

2. Workmen's tickets will only be available for the second journey between the same points as on the first journey.

These changes are made to overcome operating difficulties caused by war conditions.

Newcastle-on-Tyne.—RATING APPEAL.—The Tramways Committee has issued another report relative to the assessment of the tramway undertaking for the poor rate. The Assessment Committee has intimated its willingness to reduce the assessment for the three past years to which the Corporation had objected, but the rates have not been amended, and the Tramways Committee has been forced, as a last resource, to appeal to Quarter Sessions, or lose its remedy, and appeals are pending in respect of the poor rates made for 1915, 1916 and 1917. The Tramways Committee is advised that the rates do not conform, and cannot be made to conform, with the valuation list. The hearing of the appeal was fixed for to-day.

At the invitation of the general manager of the tramways, representatives of the local shipbuilding and engineering yards on the Tyne and the Trade Unions concerned, met to consider the complaints as to the inadequacy of the service of workmen's cars, and the fact that the local Tribunal is considering the wisdom of cancelling the exemptions of some of the men employed on tramway repairs and maintenance. After discussion, it was decided that the general manager should draw up a statement as to the position of the tramways, and that it should be supported by the firms and Trade Unions represented, so that the matter might be brought urgently before the Ministry of Munitions, that the situation might be relieved, or, at all events, that the staff should not be further depleted.

TELEGRAPH AND TELEPHONE NOTES.

Japan.—The Japanese Diet has voted a large appropriation for the extension of the telephone system in Japan.—*T. and T. Age*.

Telephone Development of the World.—Europe, which had 3,910,000 telephones at the beginning of 1914, had at the beginning of the current year probably 4,180,000, made up as follows:—

Great Britain (including emergency stations) ...	812,000
Russia (January 1st, 1916) ...	400,000
Sweden (271,797 at January 1st, 1916) ... (say)	288,000
Denmark (150,000 at January 1st, 1916) ... (say)	165,000
Norway (94,000 in January, 1915) ... (say)	100,000
Netherlands (78,743 at January 1st, 1914) ...	100,000
Switzerland (January 1st, 1917) ...	104,000
Spain (36,660 at January 1st, 1915) ... (say)	50,000
Austria (170,000 at January 1st, 1915) ...	170,000
Germany (pre-war) ...	1,421,000
France (pre-war) ...	310,000
Italy (pre-war) ...	95,000
Belgium (pre-war) ...	51,000
Hungary, the Balkans, Portugal, Luxemburg, &c. (pre-war) ...	114,000
	4,180,000

Great Britain has increased from the pre-war figure of 774,000 and even if the "emergency stations" be eliminated, a small increase is still shown. London, despite statements in the Press to the contrary, has increased from 259,000 to 269,538.

Asia had 303,000 telephones at the beginning of 1914. Since then there has been an increase of 7,000 in Japan, 6,000 in Siberia

and about 2,000 in Corea, Manchuria, and Formosa. We may safely put the total for Asia at 340,000.

There were 59,500 telephones in Africa in 1914. The figures for South Africa had increased by 4,000 by the beginning of 1916. There were at least 66,000 stations in Africa at the beginning of this year.

There are 11,300,000 telephones in the United States. Canada had 533,090 in June, 1915. The total for North America is at least 11,920,000.

In South America there were about 170,000 telephones in 1914, and there cannot be less than 230,000 stations working at present.

Official figures show that there were 168,416 telephones in Australia on June 30th, 1916. New Zealand had 58,796 and Hawaii 7,000. Total, 234,000.

In January, 1913, there were about 13,500,000 and in 1914 14,500,000 telephones in the world. At January, 1917, there must have been close upon 17,000,000.—W. H. GUNSTON, in the *Telegraph and Telephone Journal*.

CONTRACTS OPEN AND CLOSED.

OPEN.

Morecambe.—October 15th. Electric Traction Committee. Supply of electrically-driven omnibus. See "Official Notices" to-day.

CLOSED.

Accrington.—Electricity and Tramways Committee. George Hargreaves & Co.: 500 tons of coal per month for a year, at existing prices, subject to any increase or decrease fixed by the Coal Controller.

Barrow.—T.C.:—

Steam tube-cleaning apparatus.—Boiler Tube and Flue Cleaner Co., Ltd., £173.
Switchgear.—British Thomson-Houston Co., Ltd., £303.
Graving-dock switchgear.—Ferranti, Ltd., £383.
Switchgear.—Ferranti, Ltd., £330.
Transformer.—Ferranti, Ltd., £369.
Cables.—B.I. & Helsby Cables, Ltd., £1,718.

Bexhill-on-Sea.—T.C. 1,000 tons of Manners' washed peas or Shipley peas, for the electricity works: Myers, Rose & Co., 28s. 7d. per ton, carriage paid in truck at Bexhill.

Dublin.—Corporation Electricity Committee. Green economiser: G. N. Haden & Sons.

November 1st. G.N. Railway Co. (Ireland). Six or twelve months' supply of general stores (including several electrical items). See "Official Notices" to-day.

Erith.—U.D.C. H. Friday & Sons: Extensions to electricity works.

Ilford.—U.D.C. Accepted tenders (the lowest in each case):—

General Electric Co., Ltd.—Converting plant, £2,459.
W. T. Henley's Telegraph Works Co., Ltd.—Cable, £1,432.
Albion Clay Co., Ltd.—Conduits, £526.

Walthamstow.—U.D.C.:—

Tudor Accumulator Co., Ltd.—Renewal of contract for maintenance of battery at the Sanatorium for ten years, at £28 per annum.

FORTHCOMING EVENTS.

Salford Technical and Engineering Association.—Saturday, October 6th. At 7 p.m. At the Royal Technical Institute. Lecture on "The Panama Canal," by Mr. R. Barker.

Chief Technical Assistants' Association.—Saturday, October 6th. At 3 p.m. At Tavistock Hotel, Covent Garden. Discussion on "Recent Developments in respect of Organisation of Staff in Electric Light Undertakings."

University of London University College. Wednesday, October 10th. At 7 p.m. At Gower Street, W.C. Lecture on "The Engineering Plant in Large Hotels," by Mr. A. H. Barker.

Birmingham and District Electric Club.—Saturday, October 13th. At 6.30 p.m. At the Swan Hotel, New Street. Ladies' night.

NOTES.

Women Tramway Employees Assaulted.—At the Huddersfield Police Court, last week, Edward Downs, stoker, was fined 10s., and ordered to pay 10s. witnesses' expenses, on a charge of assaulting Emily Bradley, tramcar conductress, on September 7th, the defendant being a passenger on a car on the Leeds Road route, on which the complainant was on duty. Mr. Proctor (deputy town clerk), who prosecuted, said the girl conductresses on that route were insulted almost every day, and the Tramways Committee hoped the Bench would deal with such cases very firmly.

Exports to China.—The *London Gazette* for October 2nd contains a further list of persons and bodies in China to whom exports may be consigned.

Educational.—UNIVERSITY OF LONDON. UNIVERSITY COLLEGE.—Prof. J. A. Fleming, F.R.S., will deliver a public lecture on "The Work of a Telephone Exchange," on Wednesday, October 17th, at 5.30 p.m., and a course of six lectures on "The Principles of Modern Telegraphy," on Fridays, at 5 p.m., beginning October 26th, 1917. The public lecture is open without fee or ticket. The course is open both to members and non-members of the University. Fee, £1 11s. 6d. Application for tickets of admission to it should be made to the Secretary, University College, Gower Street, W.C. 1.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel Clay, V.D., commanding:—

Officer for the Week.—Second Lieut. P. Bowden.

Monday, October 8th.—Drill and Elementary Bridge Construction for No. 3 Company, Left Half Company, 6.30. Signalling Class, 6.30. Recruits' Drill, 6.30.

Tuesday, October 9th.—Headquarters closed.

Wednesday, October 10th.—Drill and Elementary Bridge Construction for No. 1 Company, 6.30.

Thursday, October 11th.—Drill and Elementary Bridge Construction for No. 2 Company, 6. Signalling Class, 6.30. Ambulance Class, 6.30.

Friday, October 12th.—Drill and Elementary Bridge Construction for No. 3 Company, Right Half Company, 6.30.

Sunday, October 14th.—Commandant's Parade for work at Esher. Parade 8.15, Waterloo Station, opposite No. 10 Platform.

Musketry.—The Range at Belvedere Road will be open every Tuesday, Wednesday, and Thursday evening from 5.30 to 7.

Medical Examination.—The Medical Officer will attend at Headquarters for this purpose every Thursday at 6.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

The Question of Combination.—In view of the interest which is being taken in the Government recommendation to our manufacturers to combine in their operations in readiness for after-the-war conditions, in competition with other countries, the remarks of Sir J. E. Johnson Ferguson, at the annual meeting of Messrs. Bolekow, Vaughan & Co., Ltd., may be quoted. He said that during the last few months they had heard a great deal about the advantages of combination. Some gentlemen had held up the United States Steel Corporation to their admiration, and asked them all to sink their individuality in one concern. Others, again, had extolled the advantages to be derived from copying the method of the German *Verband*. He, personally, did not agree with a great deal of what those gentlemen said. Small concerns, he admitted, would not be able to live in the competition of the future, but they could not describe Bolekow, Vaughan & Co. as a small concern, and it would require very conclusive evidence of the advantages to be derived by the shareholders before he would be disposed to recommend such a change as was advocated by these gentlemen. There were, however, two directions in which he thought useful developments might be made by arrangements amongst manufacturers. A great deal of useless changing of machinery might be avoided, and in that way by continuous running over a long period without a change, the output of machinery might be considerably increased. The same policy which had led to standardised ships being built should be much more largely extended than it was now to all other classes of production. The other direction in which he thought the iron and steel manufacturers of this country might, with advantage to themselves and to our national trade, act together, was that of securing the control of some of the undeveloped sources of supply. If Germany lost Alsace-Lorraine, and he supposed there was not one of them who could contemplate a termination of the war with any other result, she would lose her principal domestic source of iron ore supply. They all knew how vigilant the German Government was to foster and protect the interests of its manufacturers. They might naturally assume, therefore, that one of the very first steps it would take, after the close of the war, would be to try to secure the control of some of the principal iron ore fields of the world. The principal of those fields were far too big and important for any one individual concern to tackle, and the only way in which our interests could be protected was by the formation of a company representing the consumers, and possibly the merchants, of this country, to acquire and develop some of these supplies, and it seemed to him that if there ever was a case in which it was desirable for the Government to interest itself, this was such a case.

Fused Silica.—Israel Rosenblum, of Swampscott, Mass., has patented a method of producing articles of fused quartz in an atmosphere of nitrogen in graphite crucibles. The method is based upon the discovery that if a transparent quartz tube is slipped over a graphite rod and heated to a temperature between 1,400° and 1,600° Centigrade in a nitrogen atmosphere, a compound of silicon, nitrogen and carbon is formed, which acts as a protective coating over the graphite rod, and prevents further action on the graphite by the quartz. As the melting point of the compound of silicon, nitrogen and carbon, when once formed, is far above the temperature needed to render the quartz plastic, which is about 1,800° Centigrade, it follows that this compound acts as a protective layer, not permitting the quartz to be contaminated by the graphite. In practice, illuminating gas may also be used.—*Met. and Chem. Engineering*.

Dangers of Gas Lighting.—A serious accident recently occurred in India from an unusual cause. A gas cylinder came adrift from underneath the coach of a passenger train whilst running on the Madras and Southern Mahratta Railway between Biccavol and Anaparthi, due to one of the supports failing. The cylinder appears to have been fully charged with gas, and when it fell at one end on to the permanent way, the bogie of the moving vehicle caught it, crushed and forced it up through the floor of the carriage, where it exploded, partially wrecking the carriage and seriously injuring several of the occupants.—*The Locomotive*.

Decimal Coinage.—In issuing a pamphlet dealing with the existing British system of coinage and the proposed method of reform, which we have already noticed, the Decimal Association states that its efforts are now reinforced by the recommendations of the Institute of Bankers and the Association of Chambers of Commerce, all three bodies being in agreement that the desired change can best be accomplished by retaining the £ sterling as the monetary unit, and dividing it decimally, a course which would leave the values of all our gold and silver coins unchanged. It is pointed out that the purchasing power of the penny has completely changed during the war, and that the inflexibility of our subsidiary coinage has been one of the causes accentuating the high prices of daily necessities, which have been the root of so much industrial unrest; the present proposed changes, instead of being against the interests of the industrial classes, will in reality be of advantage to them. One has only to recall the many instances of the prices of halfpenny goods and services being raised to a penny, and of penny goods being raised to three halfpence for lack of an intermediate coinage, to realise the truth of the statement.

These advances of 100 per cent. and 50 per cent. respectively have been made when perhaps 20 per cent. would have reimbursed the sellers for their increased cost, and the introduction of new subsidiary coins, having values intermediate between our present halfpenny and penny and between our penny and three halfpence, would accordingly be a great boon to the consumers of "penny-worths" in any form.

It is certain that the pre-war level of prices cannot be restored for a long time to come (if ever), and that the provision of an enlarged range of low-denomination coins in closely graduated steps would accordingly afford much relief to our hard-pressed people, while enabling the seller to get a fair increase of price for his article. It is the aim of the Association simultaneously to provide the desired relief and to confer the benefits of decimal coinage upon the nation, thereby removing a burden which for years has oppressed all classes. Expressions of opinion on the subject will be welcomed by the Association.

Electrode Cooling.—A simple arrangement of the water cooling on electrodes, introduced by the writer some time ago, on the Heroult furnace at the Hussey-Binns Steel Co. plant, has worked very satisfactorily. The accompanying sketch, showing the arrangement as applied to the middle electrode, gives the principle.

The cooling water comes through the armoured hose (1) to distributing box (2), fastened on the outside of the columns for the electrode-holders. Only three pipes go out from the distributing box—one to each electrode, each of which is furnished with a regulating valve. Where the pipe passes the roof-ring a piece of rubber hose (3) is inserted for insulation, and connected with a

FIG. 1.—ARRANGEMENT FOR WATER COOLING.

union (4) to the pipe which goes to the cooling ring. The return pipe from the cooling ring is connected with a union (5) to the rubber hose (6), which is sufficiently long to allow for total electrode movement and some surplus to prevent kink. This rubber hose is again, by means of union (7), fastened to the pipe leading to the electrode-holder, and the return pipe from this is, by means of union (8) and rubber hose (9), connected to the downfall pipe (10), which is fastened to the electrode carriage. From the pipe (10) the armoured rubber hose (11) leads to the common waste-water box.

The advantage of the arrangement is that all pipes on the furnace can be very easily drained in case of cold weather, when the furnace is out of operation, and freezing of the water is to be feared. Disconnection of the unions of the armoured feed hose (1) and waste hose (11) will give complete drainage.

In case muddy river water is used for cooling, it is advisable not to thread the ends of the pipes on which the hose from the cooling rings are fastened. This avoids danger when, after a clogging up, steam will be suddenly developed in the cooling ring, causing the hose to blow off.

A further advantage is that very little rubber hose is used, and only three valves are to be operated by the furnaceman.—HAAKON STVRI, in *Mel. and Chem. Engineering*.

Aeronautical Institute of Great Britain.—The membership of this Institute, which is now nearly 1,000, has recently been re-classified, and it is hoped that the Associateship, which is open to accredited members of the public, will be largely availed of by the rank and file of the industry, for whose benefit a special course of aeronautical engineering instruction will be organised.

New Allied Conference in Paris.—According to Reuter (quoted in the *Times*), an inter-Ally Conference to deal with the treatment of enemy goods in occupied territory will meet in Paris on October 8th.

Practical Experiences with Tough Rubber Compound Cables.—In the last line of the article by Mr. W. Ellerd-Styles, on page 292 of our last issue, the word "brushes" should read "bushes."

Appointments Vacant.—Assistant mains superintendent (45s.) for the Rochdale Corporation Electricity Department; shift engineers for Eccles Corporation and Stepney B.C. See our advertisement pages to-day.

The Kensington and Notting Hill Arbitration: Award.—With reference to the arbitration proceedings in respect of the Kensington and Notting Hill Electricity Supply Companies, which were reported in the *ELECTRICAL REVIEW* in July last, we understand that the arbitrator has issued his award, finding in favour of the Kensington and Knightsbridge Co. on all points, subject to the decision of the Court on the legal construction of the agreements, and other points of law.

A French Exhibition of Industries.—The French nation are tackling in a very practical manner the question of rendering themselves independent of German and Austrian manufacturers. No society has been more active in this campaign than the Société d'Encouragement pour l'Industrie Nationale, of Paris. Last June the society organised, and held at their headquarters, a representative exhibition of French products. The exhibits included: (1) articles which previous to the war were not manufactured in France at all; (2) goods which prior to the war were manufactured in areas now in enemy occupation, but which have since been manufactured in regions without the Army zone. Over 71 firms showed exhibits, and the experimental electrical section was well represented. A number of manufacturers are now giving their attention to the production of glasses suitable for electric lamps, and have succeeded in turning out a satisfactory article as the exhibits demonstrated. Blown glass-work for such articles as Geissler tubes, &c., was shown. Particular interest was shown in some specimens of the Coolidge tube which one French manufacturer has taken up enthusiastically, and which, as Prof. Fery points out, is likely to assume great importance in the future in connection with the radiographic examination of metals.

A representative series of ebonite goods was shown. This class of article France obtained largely from Germany before the war, but it is now demonstrated that she can turn out articles which will answer the purpose just as well. As is the case with England, the French are taking steps to ban German-made magnetos altogether. A number of types were shown by various motor manufacturers and others. Small electric motors, too, are now being manufactured in France for a variety of purposes. For obvious reasons, very little was shown in the way of heavy electrical machinery or instruments. When practically every firm in France is engaged on war work, it is most praiseworthy to find that many are able to show that in the efforts of that country towards reconstruction, they are not neglecting the practical measures necessary in attaining the desired end. The French society mentioned above, from whose *Bulletin* for July—August these notes are compiled, is rendering signal service.

German Enterprise in Switzerland.—In *l'Industrie Electrique* it is stated that Germany is specially interested in the electrical and mechanical industries, metallurgy, construction, and financial groups controlling these industries, in Switzerland. In electricity, the Berlin group represented by the A.E.G. disposes of more than 275,000 H.P., and a capital of over 600 million fr., of which 340 millions are represented by shares, and 308 millions by loans. The Siemens group controls 310 million fr. German, or Swiss-German, *personnel* plays an important part in the administration of the enterprises in which German capital participates: thus, the Banque des Chemins de Fer Orientaux de Zurich includes, amongst 17 directors, 8 Germans and 1 Austrian; the Banque pour Entreprises Electriques, in Zurich, includes 16 Germans and only 7 Swiss; the Metallgesellschaft, of Basle, 9 Germans to 6 Swiss.

Electrical Smelting of Iron Ore.—It is announced that a new electrically-operated iron smelting plant has been built, and has commenced operations, at the Porjus Falls, this being the first attempt to treat North Swedish iron ore on the spot. The first furnace to be started is said to be producing 8 tons daily, and the output is to be raised to 20 tons per day by the starting of a second iron pyrites furnace. The erection of a third furnace to produce chrome and other alloy iron is also in contemplation.

The Industrial League.—We have received from Mr. H. Scholey, hon. secretary of the Industrial League, a pamphlet describing its objects and methods, and containing a number of appreciative extracts from Press comments. The League is the outcome of a series of small meetings of employers and prominent Labour leaders held during the past two years, with the object of bringing employers and workers together in friendly relationship—perhaps the most important and urgent necessity of the time. Its mission is chiefly an educational one, and its mode of operation is the dissemination of information with a view to enabling employers and workers better to understand each other's position with regard to social and industrial questions. Considerable success has already been achieved in this direction at the London meetings, and the League proposes to establish local Associations of the same character in large centres of industry throughout the country, which would be affiliated to the parent body and assisted in carrying on their work. It is essential to secure direct contact with the workers, and this will be effected through the medium of the Trade Unions and men who are closely associated with Labour. Both employers and workers will be represented on the General Committee, which is in process of formation. The League will work in co-operation with all Associations which have similar aims: its position is epitomised in the following general statement:—

Having regard to the fact that the war will leave the nation burdened with a huge debt, it is necessary to increase the general output of the community, and it is of vital importance that greater and more friendly co-operation shall exist between employers and employed.

It is essential, first, that the social conditions of the people should be elevated; secondly, that the greatest possible output be obtained in every industry; and, thirdly, that all industries, small as well as large, should be encouraged in every possible manner.

Agreements should provide for every willing worker, wages that will assure a certain and secure existence for himself and his dependents. A guaranteed minimum wage is therefore essential to the workers in every industry.

To encourage output, rates of wages should provide that the exercise of superior skill should be fully rewarded.

Considerable funds will be required to carry out its objects, and subscriptions (£1 per annum for individuals, £2 for firms) and donations are invited by the hon. treasurers, Mr. G. J. Wardle, M.P., and Mr. Lee Murray. Mr. J. J. Ames shares with Mr. Scholey the office of hon. secretary, and the address of the League (*pro tem.*) is 56, Victoria Street, S.W. 1.

Household Coal Distribution Order, 1917.—Owing to doubts as to the scope of the order, buildings not used as private dwelling houses (such as schools, hospitals, bakehouses, public halls and institutions, offices, &c.) have largely failed to make out requisitions for the assessment of their supplies of coal, coke, or other fuel commencing October 1st, so as to comply with the terms of the Order. As it is not desirable that a difficulty of this kind should in many cases interrupt the usual supplies to such buildings, registered coal merchants may continue their deliveries during the month of October, even although they hold no certificate authorising the supply. The merchants should at once give notice to their customers calling attention to this failure on their part to complete the necessary requisitions, so that the supply may be regularised as quickly as possible. It should be noted that where a supply of coal, coke, or other fuel is used partly for industrial purposes and partly for heating, cooking, or domestic purposes, a requisition will be required for such part of the supply as comes within the scope of the Order. The Order comes into force on October 1st, with regard to all buildings used as a private dwelling house or dwelling houses, and no extension of time is permitted in their case.

Coal Wagons.—The *Times* states that it is now confidently expected that the Controller of Coal Mines will have a sufficient number of railway and privately-owned coal wagons at his disposal by October 15th to remove all ground for anxiety about the conveyance of coal from the collieries to the various depôts established throughout the country. In this work the Controller has had the loyal co-operation of all the railway companies.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—Mr. H. BARSON has been appointed charge engineer at the Dover Corporation electricity works, *vice* Mr. A. H. Jones, resigned.

The Liverpool City Council is being asked to grant a large number of increases in salary to Corporation officials, the total amounting to something like £3,500 a year. Included amongst them are the following:—Tramways Department: Mr. C. W. Malins, general manager, from £1,250 to £1,500; Mr. T. Cook, engineer's assistant, from £400 to £500, rising 12 months later to £550; Mr. T. Ridyard, rolling stock and works superintendent, from £300 to £500, rising in 12 months to £550. Electricity Supply Department: Mr. H. Dickinson, city electrical engineer, from £1,500 to £1,600; Mr. P. J. Robinson, superintendent engineer of stations, from £500 to £700, and to be appointed chief engineer's assistant; Mr. L. Breach, assistant electrical engineer, from £370 to £425, and

to be appointed engineer's assistant, City Lighting Department: Mr. A. G. Smith, lighting engineer, from £500 to £550. The proposals have met with some criticism outside the Council, and Ald. Burgess has given notice of motion that all suggested increases of salaries over £1,000 a year be deferred for 12 months.

The Kingston-on-Thames Lighting Committee recommends that the salary of the electrical engineer (Mr. T. A. Kingham) be increased by £50 a year, with a further increase of £25 a year hence.

General.—Electrical men will receive with interest the announcement that Lord Rhondda has recognised the organising ability of Mr. H. B. RENWICK, managing director of the County of London Electric Supply Co., Ltd., and has appointed him to act as Director of Feeding Stuffs at the Ministry of Food. Mr. Renwick will be charged with the duty of organising the supply and distribution of oil cakes and other cattle food. At Lord Rhondda's special request the directors of the County Co. have agreed to loan Mr. Renwick's services for the purpose mentioned.

Mr. WM. LUNN, A.M.I.E.E., who returned from California, U.S.A., in the fall of 1915, has left Messrs. R. W. Blackwell and Co., Ltd., to take up a position as electrical surveyor with the Norwich Union Fire Insurance Society, Ltd.

At Morecambe, last week, Mr. OSWALD G. COOK, electrical engineer under the Royal Engineers, at a military power station, was married to Miss Hannah Hardill, daughter of Mr. Wm. Hardill, of Messrs. Wm. Hardhill, Sons & Co., Ltd., Netherfield Foundry, Cleckheaton.

Mr. J. FLANAGAN, of Bolton, has been appointed electrical engineer to the Tees Side Bridge & Engineering Works, Ltd., Middlesbrough.

The directors and staff of the Midland Electric Light and Power Co., Ltd., have presented an inscribed gold watch to Lance-Corporal A. J. WHITEHEAD, Signalling Company, R.E., who recently gained the Military Medal for good work in the field.

For his services in having the Dublin & Lucan Electric Railway placed under Government control, the manager, Mr. D. McDOWALL GROSART, has been presented, on behalf of the shareholders and users, with a gold watch and a cheque.

Roll of Honour.—Major GORDON SPENCER MARSTON, an electrical assistant with Messrs. Berry, Skinner & Co., who enlisted as a private in the Royal Engineers at the beginning of the war, and obtained a commission after being wounded in 1915, was mentioned in a dispatch by Sir Douglas Haig for excellent and exceptional work. He has now reached the rank of temporary Major, and has been granted the Military Medal.

We regret to learn that Lieut.-Col. ROBERT WHITEHEAD HAMMOND, Royal Fusiliers, died on September 30th of wounds received two days previously. Lieut.-Col. Hammond was the only son of the late Mr. Robert Hammond. He was an Associate Member of the Institution of Civil Engineers, a Member of the I.E.E., and was a partner with his father in the consulting engineering firm, Robert Hammond & Son.

Lieutenant A. J. ADAMSON, R.G.A., accountant to the Oxford Electric Co., Ltd., has been killed in action.

Private S. BISHOP, London Regiment, and Driver H. SCOTT, R.F.A., both formerly in the general office of the India-Rubber Co., Silvertown, have been wounded in France.

Gunner J. ILLINGWORTH, who was employed by the Phoenix Dynamo Co., of Bradford, has died of wounds received in action.

Private J. WHALLEY, Machine Gun Corps, who has been killed in action, was employed by Messrs. Dick, Kerr & Co., Preston.

First Air Mechanic S. HALL, R.F.C., has gained the D.C.M., for conspicuous gallantry. His wireless station came under heavy fire, and the aerial was shot down three times, but he re-erected it on each occasion, eventually restoring communication with his aeroplane. Before joining the Army he was a telegraphist at the G.P.O., Manchester.

Lance-Corporal F. BALDWIN, Signalling Corps, R.E., and attached to the cable section, has been awarded the Military Medal for repairing telegraph wires under heavy fire. He was employed as a linesman at the Burnley Post Office.

Private R. ROGERSON, Lancashire Fusiliers, who has been killed in action, was for 10 years employed by Messrs. I. Frankenburg & Sons, Ltd., cable manufacturers, Salford.

Private W. CAVSTICK, Scots Guards, has died from wounds received in action. He was employed in the Blackpool Corporation electricity department as a cable layer.

Rifleman H. EMMENS, Rifle Brigade, killed in action, was employed by the British Westinghouse Co., Ltd., Trafford Park.

Mr. J. WILKINSON, wireless telegraphist in the R.N.V.R., has been killed. He was employed by the British Westinghouse Co., Ltd., Trafford Park.

Signaller B. G. ALLDAY, of the K.O. Royal Lancaster Regiment, whilst serving as a wireless operator in the signalling section on August 6th, conducted himself with such gallantry as to earn the commendation of the officer commanding. He was a Blackpool-Lytham tramway employee.

Private H. E. WHETTON, Lancashire Fusiliers, who has been killed in action, was employed by the British Westinghouse Co., Trafford Park.

Private D. BRADSHAW, who is wounded, was employed by the St. Helens Cable & Rubber Co., Ltd., Warrington.

The Military Medal, for carrying dispatches under heavy shell fire, has been awarded to Private A. BRENS, London Regiment, a member of the staff of the Croydon electricity works.

Lance-Corporal W. J. FUSSELL, R.E., an electrician with Messrs. R. Kendall & Sons, of Bath, has fallen in action.

Gunner A. E. TAGG, R.F.A., who was engaged at Stafford with Messrs. Siemens Bros., Ltd., has fallen in action.

Gunner E. J. HEDGECOCK, R.G.A., who has fallen in action, was engaged at the Dover Corporation electric light works.

Mr. REGINALD DODD, W.O., R.N.A.S., who has lost his life by drowning, served his articles at the Canterbury municipal electricity works under Mr. Blascheck, and later held an appointment with the Tramway Co. at Sheerness.

Second-Lieutenant R. B. GASKIN, Northumberland Fusiliers, who has fallen in action, was on the staff of Messrs. Aiton & Co., of Derby.

Sapper F. A. BUTTON, R.E., who has died from fever at Basra, was on the staff of the Brouley (Kent) Electric Light Co.

Captain R. H. UNTHOFF, R.E., who was before the war chief electrical engineer to Messrs. Pilkington Bros., Ltd., of St. Helens, has been wounded in action.

Private F. C. FOSKETT, employed by the Birmingham electric supply department, has been killed in action, aged 19.

Second-Lieutenant N. C. WHITTALL, R.F.C., a member of the staff of Messrs. Elliott Bros., Ltd., was killed in action on September 13th.

Private N. DENNIS, aged 21, an employé of the Halifax Corporation tramways, has been awarded the Military Medal for bravery. He was wounded on the day on which he earned his award.

Private A. CAMERON, employed in the electrical department of the Glasgow Corporation car works at Coplawhill, has been killed in action.

Obituary.—Mr. JOHN HESKETH.—We regret to learn from the Australian papers that are to hand this week, that Mr. John Hesketh, A.M.I.C.E., M.I.E.E., chief electrical engineer to the Commonwealth Postal Department, passed away in July, after an illness of several months, at the age of 49 years. As many of our readers will remember, Mr. Hesketh went out from this country in 1896 under engagement to the Queensland Government for the purpose of organising that State's telegraph and telephone service. Ten years later, says the *Australian Statesman*, the postal, telegraph, and telephone services of the various States having in the meantime been taken over by the Commonwealth Government under the federation scheme, Mr. Hesketh was appointed chief electrical engineer to the Commonwealth, and it is due to him that the telephone and telegraph systems have been remodelled. "Amongst other changes brought about by him, he was responsible for the introduction of the common battery system in telephone working and the adoption of the toll system of subscription. His official and professional career was marked by enthusiasm for his work and readiness to assist young men who showed themselves capable of a similar attachment to it, and a desire to rise in their profession by merit, and not to rely upon promotion by right or seniority. His loss will be very great to the department." He was the local hon. secretary and treasurer of the I.E.E. Several years ago Mr. Hesketh was sent by his Government to America on a tour of investigation, and it was as a result of that visit that the change over to common battery working was made. He held a commission in the Australian Engineers, and since the outbreak of war he had acted in an advisory capacity to the Defence Department on telegraphic and telephonic questions. Of the two sons of the deceased gentleman, one left Australia several months ago for work on munitions in England.

Mr. E. H. JOHNSON.—We read in an American contemporary that Mr. Edward H. Johnson, aged 72 years, a former telegraphist, and for many years associated with Mr. Thomas A. Edison in the introduction of the latter's early inventions, recently died in New York. Mr. Johnson was instrumental in introducing automatic telegraphy, and was at one time president of the Magnetic Club. He was one of the most prominent figures in electrical circles from 1875 to 1900, since which time his health had failed him.

Will.—The late Sir GEORGE WHITE left £185,000 gross, and £137,000 net personality.

NEW COMPANIES REGISTERED.

J. B. & J. Atherton, Ltd. (148,540).—Private company. Registered September 26th. Capital, £1,000 in £1 shares. Manufacturers, merchants, importers and exporters of, and contractors for, fuel oil, ammonia, cresote salts, fuel of all kinds, and for all kinds of motive power, coal, coke, breeze, and peat merchants, manure and chemical manufacturers, mechanical and electrical engineers, &c. The subscribers (each with one share) are:—J. B. Atherton, 12, Sandringham Drive, Liverpool, merchant; J. Atherton, Hurst House, Huyton, near Liverpool, merchant. The first directors are:—J. B. Atherton and J. Atherton. Solicitor: F. F. Gaskell, 71, Lord Street, Liverpool.

T. B. Watson & Son, Ltd. (148,546).—Private company. Registered September 26th. Capital, £6,000 in £1 shares. To take over the business of plumbers, electricians, and sanitaries and heating engineers carried on by T. B. Watson, at Stockton-on-Tees and Middlesbrough, as T. B. Watson and Son. The subscribers (each with one share) are:—T. B. Watson, 13,

West End Terrace, Stockton-on-Tees, electrical engineer and plumber; H. C. Watson, New Clyde Terrace, Stockton-on-Tees, electrical engineer and plumber. The first directors are:—T. B. Watson and H. C. Watson. Solicitors: Townsend & Bertrand Watson, Stockton-on-Tees.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

British Miniature Electric Vehicles, Ltd.—Issue on September 14th, 1917, of £1,000 debentures, part of a series of which particulars have already been filed.

Foster Construction Co., Ltd.—Issue on September 24th, 1917, of £600 debentures, part of a series of which particulars have already been filed.

Burt, Escaré & Denelle, Ltd.—Satisfaction to the extent of £1,500 between January 1st and August 18th, 1917, of debentures dated December 31st, 1915, securing £7,500.

CITY NOTES.

Manaos Tramways & Light Co., Ltd.—The report for the year ended April 30th last states that the economic conditions in the Amazon valley did not compare unfavourably with those which obtained during the preceding year, and the result indicates, says the *Financial Times*, a gradual return to prosperity in this district. Brazilian exchange improved slightly in the course of the year. The loss on remittances from Manaos was £12,231, against £13,093. The gross earnings from all departments exceeded those of last year, being £120,387, as compared with £110,524, while the operating expenses increased from £76,172 to £82,511. The net operating revenue carried to profit and loss account increased from £34,352 to £37,876. After providing for debenture interest, sinking fund, interest on loan, London office expenses, sundry charges, and loss in exchange, there remains a balance of £6,628. The directors recommend transferring to contingencies reserve £3,000, making a total of £26,725, to transfer to renewals reserve £3,000, making £30,000, and to carry forward £628.

Automatic Telephones (Australasia), Ltd.—The report for the year ended June 30th shows that the company is prosperous. The credit balance is £6,416, out of which a dividend of 10 per cent. will absorb £6,250, but it was proposed only to pay 1s. per share in August, and another 1s. in six months, or as the directors may determine. The reason for this is that, since the year closed, orders for 7,300 new lines have been accepted, which will tax the financial resources of the company in times like these. The orders are for Sydney, Melbourne, and Christchurch, N.Z. The company have 25,000 lines in operation in Australia, and 1,500 in New Zealand at the present time.

Halifax & Bermudas Cable Co., Ltd.—The net balance for the year ended June 30th, 1917, is £19,650, as against £12,745 in the preceding year. The interim dividend of 3 per cent. is followed by a further equal payment, both free of income-tax, leaving £16,650 to carry forward. The balance to credit of revenue account, which was £9,210, has been debited with £1,500 applied to dividend and £2,202 expended in repairs, and credited with £16,650 surplus revenue of the year, and it now stands at £22,158, subject to excess profits duty. The cable worked efficiently during the year. Mr. H. F. Russell has been elected a director in place of the late Mr. W. M. Kent.

Marconi International Marine Communication Co., Ltd.—The directors announce that allotment letters in respect of the issue of 250,000 new shares have been posted. The issue having been largely over-applied for, applicants receive an allotment equal to five-sixths of their holding, applications for less than that proportion being allotted in full.

British Electric Transformer Co., Ltd.—Interim dividend of 6 per cent. per annum (7 1/5d. per share), less income-tax, on ordinary shares for half-year.—*Financial Times*.

Stock Exchange Notice.—Application has been made to the Committee to allow the following to be quoted in the Official List:—

Melbourne Electric Supply Co., Ltd.—Further issue of £150,000 5 per cent. consolidated debenture stock.

Kalgoorlie Electric Power & Lighting Corporation, Ltd.—Dividend on the preference shares at the rate of 4 per cent. per annum for the six months ending September 30th.

Shawinigan Water & Power Co.—Dividend of 1 1/2 per cent. for the quarter ended September 30th on the common shares.

Switzerland.—Messrs. Brown, Boveri & Co., of Baden, have lately increased their capital from £1,250,000 to £1,440,000.

Callender's Cable & Construction Co., Ltd.—Interim dividend at the rate of 10 per cent. per annum on the ordinary shares for the half-year, the same rate as a year ago.

Fraser & Chalmers, Ltd.—The directors, with Treasury sanction, have been inviting applications for £100,000 6 per cent. first mortgage debentures of £100 each at 93 1/2.

Montreal Tramways Co.—For the year ended June 30th last, while the gross passenger earnings show the satisfactory increase of 14.45 per cent. over last year, operating expenses increased by 24.14 per cent. The total expenditure on upkeep was \$1,359,931, against \$897,470 last year. After deducting bond and loan interest \$858,542, interest on debenture stock \$800,000, contingent account \$350,000, and estimated war tax \$110,000, there is a surplus balance of \$77,473.

Direct West India Cable Co., Ltd.—For the year ended June 30th, 1917, the net result is a balance of £27,374, against £11,705 for the previous year. The interim dividend of 3 per cent. is followed by a further equal payment, both free of income-tax; leaving £21,674 to carry forward. The balance to credit of revenue account, which was £54,719, has been debited with £1,350 applied to dividend and £6,394 expended on repairs, and credited with £21,674 surplus revenue, and it now stands at £71,680, subject to excess profits duty. The cables worked efficiently during the year, but the insulation of the Bermudas-Turks Island section remains low. Mr. H. P. Russell has been elected a director in place of the late Mr. W. M. Kent.

Companies to be Struck Off the Register.—The following are to be struck off the register within three months unless cause is shown to the contrary:—

Clearstone Antiseptic Telephone Drum, Ltd.
Electrolysers, Ltd.
Electromechan Co., Ltd.
Grip Nuts, Ltd.
Metallic Alloys, Ltd.
Tyrone Power Co., Ltd.
Universal Electric Contracts, Ltd.
Volta Instrument Co., Ltd.

STOCKS AND SHARES.

TUESDAY EVENING.

Most of the business this week has been in the air. Stock Exchange markets have been interfered with, mainly through the interruption caused to the postal services. This has extended to telegraphs as well as to letters; and, in addition to this, perhaps there was not quite so much desire to scout for business as there is in the ordinary way. When energies are directed mainly towards getting everything cleared up as soon as possible by the early hours of the evening, it is natural that business should go slowly.

The appearance of the new War Loan is another factor making for quietude amongst investment stocks. So far, the public have hardly become familiarised with the terms of the new issue, although no doubt its attractions will be more prominently set forth soon. The Stock Exchange is no whit disturbed; Consols even improved a little on the appearance of the prospectus. Great interest is shown, of course, as to the success which the loan is likely to achieve.

Want of trade in the Home Railway market is the principal feature there. The sudden rise in popularity of the Tubes and Undergrounds has not sufficed to stiffen prices. Metropolitans are $\frac{1}{2}$ lower at 23 $\frac{1}{2}$. Districts and the Underground group hold their previous levels; and the rise in the Central London trio of assented stocks is well maintained.

During the last day or two something of a feature amongst industrials has been the weakness of Canadian securities. This has affected more particularly those of Canadian railway companies, but others are sympathetically influenced, the reason being that, in spite of the apparent prosperity attendant upon most of the undertakings, working expenses show a still more remarkable development, and increase instead of diminish. The railway companies are clamouring for power to raise their freight rates; and the industrial concerns will no doubt take steps to meet in other ways the constant rise in the costs of production. But for the time being Canadians are out of favour, and prices are depressed.

Home shares are more popular. There are no changes to record this week amongst the issues of the home electricity companies, but, on the other hand, there are very few shares to be obtained, and there is nothing which makes more greatly for market stagnation than scarcity of supply. It will be noticed from our lists that at the present quotations a return of 6 $\frac{1}{2}$ -7 per cent. can be obtained from such shares as Bromptons, Charing Cross preference, Chelseas, and South Metropolitan preference; but when a would-be buyer comes to inquire for shares, he is met so often with the reply that there are none on offer that he gives up the quest and puts his money into something else.

Amongst the foreign issues, Mexicans continue to mark time, although there is a good deal of hesitation displayed in regard to most of the stocks in this market, including those of the utility companies. News and rumour alike seem lacking. The inventive genius of the journalists who specialise in Mexican matters lies fallow; and, in the absence of any

kind of stimulus, the market has relapsed into a state of torpor.

Brazils are moving closely along the path set by the course of exchange, and this just lately has been a little erratic. Consequently, Brazil Tractions remain weak at 46. British Columbia preference has fallen 2 to 40 $\frac{1}{2}$; and although there is not much doing in the market, we are able to state that active measures are being taken by those who have in hand the protest against the apparent intention of the Municipality of Vancouver to enter into competition with the British Columbia Electric Railway.

The cable market is steady, with Globe ordinary and preference quoted ex dividend. Both shares have recovered part of the amount taken off the price. Anglo-American preferred is within a point of par; but West India and Panamas reacted to 13. Oriental Telephones are 1/16 better, and Great Northern Telegraphs rose $\frac{1}{4}$. The activity in Marconis is continued, and the parent shares have improved another 1/16 to 3 $\frac{1}{2}$, while Americans are strong at 20s. 3d. Canadians, however, loiter around 10s. 6d.

The manufacturing list is quietly good. Babcocks rose to 35/16. British Aluminium ordinary have recovered to 32s. 6d. ex dividend. British Insulated at 14 $\frac{1}{2}$ are the same price ex as they were cum; and British Westinghouse preference hardened to 3 $\frac{1}{2}$, following upon their rise of 5/16 last week. General Electrics are again 10s. to the good at 17 $\frac{1}{2}$, and the only decline in the list is a fall of 10s. in Henleys, due to a couple of hundred shares coming in on account of a deceased holder. Rubber shares are reasonably steady, notwithstanding a decline in the price of the raw material; and there is a fair amount of strength shown by shares in the armament group.

THE HIGH-TENSION MAGNETO.*

(Continued from page 311.)

AEROPLANE-TYPE MAGNETOS.

THE greater number of the magnetos built in this country since the outbreak of war have been used on aeroplanes. This means that the British magneto industry, from the moment of its inception, had to contend with the most difficult problem of all, because an aeroplane magneto has to operate under more severe and exacting conditions than obtain on any form of motor vehicle.

The mantle of responsibility was borne during the early stages of the war by the firm of Thomson Bennett, in Birmingham (who, to their credit, were struggling to create a magneto industry before the war); the B.T.H. Co., in Coventry; and the M.L. Magneto Syndicate, in Coventry. More recently many newcomers have joined the industry, with the result that at the present moment there are no fewer than 15 manufacturers engaged on this most important work.

Special credit is due to the three manufacturers named above, and in particular to Mr. E. A. Watson, technical director of the M.L. Mag-

FIG. 4.—CONTACT-BREAKER OF B.T.H. A 8 S MAGNETO.

neto Syndicate, and Mr. J. D. Morgan, of the Marks and Clark laboratory and consulting engineer to the firm of Thomson Bennett.

As evidence of what has already been done, the author briefly describes in his paper some of the aeroplane-type magnetos that

FIG. 5.—FLUX CHANGES IN B.T.H. TYPE A 8 S MAGNETO.

are now being produced in very large quantities by the three manufacturers mentioned.

The M.L. Magneto Syndicate type A.D.S. magneto, which is of the rotating-armature single-cylinder type intended for use on

FIG. 6.—FLUX AND VOLTAGE WAVES, A 8 S MAGNETOS.

rotary engines of the Gnome, Mono-soupape, Clerget, or similar types, is based on the original Bosch D.A.L. design, but has been

* Abstract of paper read by Mr. A. P. YOUNG, A.M.I.E.E., before the AERONAUTICAL SOCIETY.

improved in many respects. The chief modifications which have been found necessary have been in connection with the contact breaker and the cams, as these machines have to run at a very high speed, from 2,500 to 3,500 R.P.M. Consequently, the whole Bosch design of flat cam, which gave rapid acceleration of the contact-breaker arm, has been given up, and the cams now fitted are made to a correctly-shaped profile, which is ground out on machines specially designed and constructed for the purpose.

In addition, it has been found necessary to increase the length of opening the primary circuit, in order to give time for the spark to die out when the machine is working at a high speed. This alteration has completely removed a trouble experienced with the D.A.L. type, of mistiring if the engine were inclined to be oily.

FIG. 7.

and has removed the necessity, previously apparent, for very close and careful setting of the plug points. It has also increased the life of the contact-breaker arm and the platinum points, and has made the machine suitable for use at much higher speeds. The cam is made from a continuous ring of steel, very carefully ground inside and out in order to ensure absolute concentricity.

The Thomson-Bennett type A.D.4 magneto is a four-cylinder machine of the rotating armature type, corresponding in size to the Bosch type Z.U.1 magneto used extensively in this country during the years preceding the outbreak of war. The Bosch design has been simplified, chiefly in respect of the construction of the bearing for the half-speed wheel, but many of the other features have been retained.

The B.T.H. eight-cylinder type A 8 S magneto is of the sleeve inductor type with fixed armature. It is designed to give four sparks per revolution, and is therefore fundamentally different from the ordinary rotating-armature type of magneto, which cannot give more than two sparks per revolution. The sleeve inductor rotates at engine speed. A six-cylinder machine (type A 6 S) is

FIG. 8.—PRIMARY CURRENT CURVES.

also built on the same principle, designed to run at three-quarter engine speed, but this differs from the eight-cylinder machine only in respect of the distributor and gearing.

The contact-breaker is shown in detail in fig. 4. A pivoted

Curve 1, Open-Circuit Primary Voltage Curve for 1,000 R.P.M. OX represents Axis of Fixed Armature position of Break. A, for full advance.

steel bell-crank lever arm carries at one end a fibre block which is actuated by the rotating eight-part hardened steel cam rigidly fixed to the distributor brush spindle, while at its other end the

movable platinum contact screw is secured. A very strong steel spring fixed at one end to the contact lever arm, and at the other end to the base plate, serves to force the movable contact tightly against the adjustable fixed contact when the cam is not in engagement with the fibre heel.

It is clear that the contacts are opened eight times during each revolution of the cam shaft, which rotates at half the speed of the sleeve inductor, thus giving four breaks per revolution of the latter—as desired.

It is evident from the illustrations in the paper that the manufacture of such a magneto on a large scale must have been attended with considerable difficulties, because there are no fewer than 397 parts of different design, and a total of 860 parts are actually used in the construction of one machine. Bearing all this in mind, it is

FIG. 9.

very gratifying to know that magnetos of this type are being produced in very large quantities under the guidance of Mr. R. Dumas.

Fig. 5 gives diagrams corresponding to different sleeve positions 45° apart, and on each diagram, the approximate flux distribution between the magnet poles is shown. Considering positions 1 and 3 (equivalent also to 5 and 7), it will be noted that in each case the flux through the armature core is zero. Furthermore, for the intermediate forms 2 and 4 (also 6 and 8), the direction of the flux through the core is alternately positive and negative; that is, in position 2 the flux flows upwards, and in position 4 downwards. In other words, the flux through the armature core reverses its direction four times during each revolution of the sleeve, giving four sparks per revolution. A magneto of this type is sometimes

FIG. 10.

called a two-cycle machine. The flux wave, plotted in fig. 6, crosses the zero line at four points 90° apart, which correspond to the sleeve positions 1, 3, 5 and 7.

The maximum value reached by the flux wave is approximately 32,000 lines. This is the actual flux which links itself with the primary and secondary windings carried by the fixed armature core. Assuming a leakage coefficient of 1.4, the magnet flux works out at 45,000 lines.

The flux density in the magnets = 5,900 lines per sq. cm., and in the armature core 8,500 lines.

These figures are very high for an inductor type of magneto, although they are lower than the figures worked to in a magneto with rotating armature. The difference is accounted for by the fact that in the type "A" magneto—as in all inductor-type machines—there are four air-gaps in that portion of the magnetic circuit lying between the pole faces, as compared with only two gaps in the two-spark rotating-armature type of magneto. The increased reluctance due to the larger number of air-gaps naturally means that the available flux is smaller, using magnets of corresponding size and strength.

Having determined the flux wave, it is easy to compute the induced voltage wave resulting from the rotation of the sleeve, assuming that the contact-breaker is inoperative and the primary short-circuited; or the flux wave can be calculated from the voltage wave, as in fig. 6, in which the voltage wave is reproduced from an oscillogram at 1,000 R.P.M.

In the secondary coil a voltage is induced by the rotation of the sleeve, which conforms in shape to the primary voltage wave, but the maximum voltage is higher in the ratio of the windings, which

in this magneto is very high, the maximum secondary voltage being about 3,000 volts at very high speeds. The maximum value is reached just after the sleeve has passed position 1, fig. 5, which the author calls the "dead centre," the phase displacement being 3° .

The author has plotted the primary current curves for six speeds, ranging between 100 and 3,000 R.P.M., on the basis of the open-circuit primary voltage, fig. 6, and the primary self-induction curve, fig. 7.

These curves, fig. 8, show that the maximum value of the primary current increases with the speed, very rapidly at low speeds, but hardly at all when the speed is high. In fact, at abnormally high speeds the maximum value will actually fall off, owing to the damping caused by the eddy currents induced in the

FIG. 11.

rotating iron segments, which have the effect of preventing the flux in the stationary armature core rising to its proper maximum value after each reversal. It is important to note also that the maximum point on the current curve is, as it were, displaced forward in the direction of motion as the speed is increased.

The difference between the curves corresponding to the fully advanced position of the timing lever (fig. 8), and to the fully retarded position respectively at any particular speed is very small. For full advance the position of the rotating sleeve at "break" is shown on fig. 8 by the dotted line A, and by determining where this line intersects the six curves, the maximum current I_b for each speed can be found. For the fully retarded position of the timing lever, the contacts close at 17° instead of 32° , and the "break" is at

FIG. 12.

TIMING LEVER,
FULLY ADVANCED.TIMING LEVER,
FULLY RETARDED.

$22\frac{1}{2}^\circ$ instead of $7\frac{1}{2}^\circ$. The maximum voltage is proportional to I_b , and by plotting the latter against the speed, a curve representing the variation of voltage with speed is obtained (fig. 9); the upper curve represents the variation in the maximum available energy with the speed ($\frac{1}{2} L I_b^2$).

Maximum sparking voltage and spark energy curves obtained by experiment are plotted in fig. 10.

Experiment has shown that under normal working conditions a new sparking plug requires about 3,500 volts to cause a spark to jump between the electrodes when the piston is in the firing position and the compression is about 80 lb. per sq. in. It is therefore interesting to note that this voltage is given by the magneto at the very low speed of 60 R.P.M., the point being indicated on the curve. The normal running speed is 1,800 R.P.M. The energy output per spark was determined by a calorimetric method, and was about 80 per cent. of the calculated value (fig. 9), the remainder being dissipated in the iron masses in the magnetic circuit and in the windings. Oscillograms reproduced in the paper show that the actual value of I_b agrees substantially with the calculated value in every case.

On determining the value of the armature core flux, it is found to diminish gradually as the speed is increased, due to eddy currents set up in the masses of iron, which cause the energy curve to drop at about 1,000 R.P.M.; this effect can be reduced more readily in the polar inductor type of magneto by careful attention to the design. The rotating-armature type of magneto standardised by Bosch is a very bad offender from this standpoint; in one of the Bosch Co.'s latest magnetos, at 1,000 R.P.M., the flux fell off 23 per cent.

In fig. 11, curve 2 shows the relationship between the R.M.S. value of the open-circuit primary voltage, and curve 1 the short-circuit

primary current, with the speed. The shape of the voltage curve, which would otherwise be a straight line, shows that the armature core flux falls off as the speed increases. The dotted curves 3 and 4 relate to a Bosch magneto of corresponding type. A very good idea of the probable operation characteristics of a magneto can be gathered from the value of the open-circuit primary voltage at a definite speed; the B.T.H. Co. measure the voltage of every magneto at 2,000 R.P.M. immediately after magnetising, with and without the secondary short-circuited, and the values must not fall below a fixed

FIG. 13.

minimum in the latter case, or drop more than a certain percentage in the former. A large percentage drop indicates that the magnets have low coercive force.

Fig. 12 shows some oscillograms which have been plotted in the form of circle diagrams, the duration of the H.T. spark being indicated; the diagram enables one to form a mental picture of the growth of the currents induced in the primary and secondary during one revolution of the sleeve inductor.

Fig. 13 gives curves showing the variation of driving power, and output, in watts, and the efficiency, with the speed.

(To be continued.)

REVIEWS.

Advanced Text-book of Magnetism and Electricity. By R. W. HUTCHINSON, M.Sc., A.M.I.E.E. London: University Tutorial Press. In two volumes. Price 8s. 6d. complete.

The issue of a comprehensive advanced manual of magnetism and electricity from the pen of the joint author of Davidge & Hutchinson's "Technical Electricity" is an event of some interest to the student of physics. It is, perhaps, unfortunate that the publication should occur when the number of such students is so seriously depleted by the claims of war-work at home and abroad. The fact that Mr. Hutchinson's book is to be regarded as a kind of lineal successor to Dr. Wallace Stewart's "Higher Text-book of Electricity and Magnetism" also raises our expectations with regard to it.

In his preface the author states that the aim of the book is to give "a clear and comprehensive account of the main principles of the subject based on accurate scientific definitions and embodying the distinctive results of modern research." Both the experimental and theoretical sides of the work have been fully treated, and great care has been taken to deal adequately with the many difficulties which, in the present state of our knowledge, must necessarily arise in connection with the theoretical explanations of the various phenomena. The scope of the book is that of the final degree examinations of the universities, and consequently a knowledge of the subsidiary mathematics up to and including the notation and first principles of the calculus has been assumed throughout. Although intended for advanced students some of the elementary sections are treated at length, and there is no doubt that, as the author anticipates, the student who feels that he already has a sound knowledge of these fundamental principles will appreciate a revision on scientific lines.

The first volume deals with magnetism and electrostatics. Some of the earlier sections in both of these subjects are reminiscent of Stewart's "Higher Text-book," but even these elementary and fundamental matters have been brought thoroughly up to date and reference has been made to recent research.

The first two chapters in both subjects are entitled "Fundamental Phenomena" and "Fundamental Theory." The former gives an introductory survey of the whole subject

from an experimental point of view, and the latter deals with the mathematical basis on which subsequent chapters depend. There is very little that we have been accustomed to regard as inseparably connected with Sir J. J. Thomson's "Mathematical Theory" that Mr. Hutchinson has not covered, and in many cases he has extended the usual mathematical investigations to special cases, and given proofs and definitions which will be appreciated by students for their neatness and brevity. A few notable examples of this perspicuity of diction combined with scientific accuracy of definition may be mentioned. Section 88, on field strength, unit field, tubes of force, and induction, deals with the intricacies of Maxwell tubes, tubes of induction, and Faraday tubes in a very masterly manner; forces between small magnets and magnetic shells are also well done, and the development of the idea of potential in both magnetism and electrostatics leaves nothing to be desired.

Chapter III, on magnetism, deals with magnetic measurements. All the usual magnetometric methods are given, but it is remarkable that the measurement of magnetic fields by search coils, bismuth coils, and the methods due to Du Bois and Lippman are not even mentioned, the only methods of measuring field strengths given being those of the deflection and oscillation magnetometers.

The remaining chapter on magnetism, that on terrestrial magnetism, is a very complete treatment of the subject. The dip circle is usually dealt with at length in such manuals, but it is seldom that the Kew magnetometer receives a fair share of attention. Here, however, the methods of determining all the magnetic elements are very carefully described and illustrated, and some account is also given of magnetographs and the question of variations in these elements. An interesting paragraph outlines the various theories of terrestrial magnetism and the present-day attitude towards them.

In addition to the chapters already indicated, the electrostatics section includes important chapters on condensers and capacity, instruments (from the historic Coulomb balance to the most recent forms of electrometer), measurements (including the important experiments of Silow, Aron and Cohn, and Boltzman and Hopkinson on specific inductive capacity), and atmospheric electricity.

The second volume deals with electro-dynamics. The earlier chapters on cells and the properties of currents are thorough expositions written along the usual lines. The author is particularly clear and exact in his statements concerning units—a subject in which a little knowledge is a very dangerous thing—and he deals very fully with the more recent theories and experiments concerning the chemical effects of the current, even concentration cells and the Lippman electrometer receiving a fair share of attention. The chapter on thermo-electricity is one of the best in the book and incidentally reveals by its methods and nomenclature the author's *alma mater*!

A separate chapter is devoted to electrical measurements, and a further chapter to the measurement of inductance. The concluding paragraph of the latter is worth quoting, because it tells us at once that Dr. Hutchinson is *not* one of those teachers who forget that they were once students:—

"The student who works through the preceding tests will come to the conclusion either that he is a poor experimenter, or that the apparatus is wrong—probably the latter. Both conclusions may possibly be correct, but the methods are nevertheless troublesome and unsatisfactory at the best. Newer methods, depending on the employment of alternating currents, are being developed." He then mentions briefly the methods depending on Campbell's vibration galvanometer.

It is, of course, expected of such a text-book as this that it will not only deal with the principles and practice of magnetism and electricity as they were understood by our fathers, but that it will also give introductions to those great outlying tracts of knowledge which are now of such gigantic importance as to merit whole literatures of their own. Such are alternating currents, electrical oscillations and waves, the passage of electricity through gases, and radio-activity and the electronic theory.

It is to these subjects that Mr. Hutchinson devotes the last 180 pages of his second volume. He gives brief historical accounts of each subject, discusses the principles, and describes the chief experiments, and refers to the directions along which controversy and research are proceeding. The whole of this part of the book appears to us to be above criticism, and no student will regret the source of his first instruction in these matters if he reads from this book. The author would be the last to claim any finality for the views expressed in these chapters, and the student may be warned against dogmatism in approaching these borderlands of physical knowledge. Mr. Hutchinson has given a fair statement of the condition of electrical theory as it is to-day—to-morrow will have theories of its own.

Every chapter in the book has a series of exercises at the end, many of which are taken from university examination papers, including the honours papers. There is also an appendix of useful tables, and a brief bibliography. Both volumes have some striking features, and, what is of far greater importance, they lack no essential of a sound and useful text-book. The two parts are not sold separately, but the price charged for the complete work is extremely moderate.—P. H. S. K.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

FRANCE, ALGERIA, AND TUNIS.—The Ministerial Decree of April 13th restricting the importation into France and Algeria of goods from foreign countries has been modified by further Decrees, dated July 8th and 13th, the effect of which is to make it necessary for French importers to obtain a special licence from the "Comité des dérogations aux prohibitions d'entrée" of the Ministry of Commerce, for merchandise other than that specified (food products, manures, fuel, agricultural machinery, &c.) which was not actually shipped prior to July 9th.

Under a Presidential Decree of June 15th fees are now being charged for both import and export licences in France. For imports other than by parcel post and for imports by parcel post, consisting of 10 parcels or more, the fee is 5 francs per licence; for less than 10 parcels by parcel post, the fee is 50 centimes per parcel. Similarly, in the case of export licences the fees are 2 francs per licence and 20 centimes per parcel, respectively.

Fees at the same rates are being charged in Tunis as from July 1st.

TRANSIT OF GOODS THROUGH FRANCE TO SWITZERLAND, ITALY, AND SPAIN.—It has been officially announced that the transit arrangements for goods sent *via* France to Italy and Spain have now been made similar to those in force for goods going to Switzerland. Goods which are not prohibited to be exported from the United Kingdom to Italy and Spain, but which are prohibited to be exported from France to those destinations, can now be sent under the "pink certificate" S. 45 B, which will satisfy the French Customs authorities, and will ensure that the goods shall not be detained by them. The certificates are handed to the master of the ship conveying the goods to France, with a notice stating that they must be delivered to the Customs authority at the port of discharge, and that failure to do so may lead to the detention of the goods.

Applications for licences in respect of such consignments should be addressed to the War Trade Department, and special attention should be drawn to the fact that the goods figure on the French list of prohibited exports, and that it is proposed to ship the consignment to Italy or Spain *via* France, and not direct by sea. In the case of Spain, however, the arrangement will not apply to consignments of goods which exceed half a ton in weight.

A full statement of the regulations now in force respecting the transit through France of goods sent from the United Kingdom to Switzerland, Italy, and Spain, *via* France, is published in the official *Board of Trade Journal*. Firms interested should consult the *Journal*, or they can obtain full information from the Department of Commercial Intelligence, 73, Basinghall Street, E.C. 2.

Packing Glassware.—American cut glass, especially the cut glass with silver trimmings, is winning an enviable place in the Peruvian market. Shipments of plate glass are liable to have dropped upon them at any time a ton or two of other goods; the Belgian manufacturers have demonstrated that glass can be packed to meet this condition. The only thing to do is carefully to pack the product tightly in a light case, which must be enclosed for export in an outside case of strong lumber, made large enough so that an ample cushion can be provided on all sides of the inside case that contains the glass. This cushion will receive the shock of blows, and distribute the impact.

Instead of having the ends and sides of the inside case parallel to the outer one, it is preferable that it should lie diagonally, so that two opposite corners may touch the outside case, and two other opposite corners have an ample cushion. In this manner, it is said, glass can be packed for export to any point along the coast, without the least danger of breakage.—*Scientific American*.

4, Ludgate Hill, London, E.C. 4.

THE IMPORTANCE OF INDUSTRIAL INFORMATION.

In his recent speech to the Library Association, Dr. Addison, the Minister for Reconstruction, clearly indicated that he appreciated the importance of the ample provision of serviceable industrial information for the use of men who are competent in a particular business. Trade and technical journalists who, through good and bad report, have made this their specialised vocation may welcome this recognition of their service by those who are leading in the work of preparation for a period of efficient reconstruction. During the past three years, when the country "has been handicapped to a tragical degree by the absence of necessary scientific and industrial information of a serviceable kind," the technical and trade journals have been enabled to play a more important part in the national organisation than was ever before their privilege. Those which have been directly dealing with the electrical, engineering, and other munitions industries which have been serving the national purposes in "an engineer's war," know well enough how valued their assistance has been by thousands of professional men and by hundreds of thousands of other workers, not only when given in the form of published articles, but also in the form of private correspondence in which funds of expert information have been freely drawn upon by the editor and imparted to the inquirer. This may be described as direct national service helping materially in the efficient and expeditious equipment of works, the installation and running of plant, and speeding up the output of munitions of war. In addition to this, as our own experience has shown, established journals have been turned to not once or twice, but hundreds of times by those in Government Departments who knew where they could ascertain essential information which was not in the archives of our pre-war Governmental intelligence departments. The large number of men of technical qualifications and industrial and commercial experience who, leaving their private callings, have taken up employment on war service in some department or other requiring their specialised knowledge and abilities, have known just where to put their hands on the trade journal editor who could help them, and this information, passed on by them to permanent civil service officials, has raised the prestige of the specialised organs very materially both in the present and for the future. It may still be felt that the usefulness of this branch of service has not been adequately recognised by some in high authority, but the fact remains that one of the best servants of the State, working more or less silently and often quite unobtrusively, though always most eagerly, has been the technical Press.

Dr. Addison, in his speech, showed that in order to pay for the war it is necessary for the different trades and industries of the Allies to organise more and more for the production and dissemination of useful and necessary information. He urged the great trades to take up the question of promoting scientific research in particular industrial processes, and in this connection he considered that the public libraries could perform valuable work by placing information useful to the industries of various districts, at the disposal of the communities in those districts. Here it will be recognised that the technical

and trade Press and books have an important function to fill. We believe we are correct in stating that technical books relating to all matters having any bearing on war productions have been in enormous demand during the war, and the needs of the future, when technical study and manufacturing are able to return to a more normal course, will be very considerable. Nothing can supersede the work of the competent author of all kinds of technical literature. This point was recognised by other speakers at the meeting of the Library Association, which had before it several resolutions dealing with the establishment of commercial and technical libraries. Mr. MacAlister remarked that while commercial libraries were quite a recent development, we had always had technical libraries in some form. He suggested, however, that they needed to be developed in several directions to become efficient aids to the arts and manufactures of this country. He mentioned that the possibilities of the technical library in aiding research, discovery, and invention had never been fully realised in England; we fully agree with this statement, which we commend to the notice of British manufacturers.

In how many engineering works in this country will be found a library of technical books, selected under competent advice, and comprising the best and most up-to-date treatises and works of reference bearing upon the particular branch of industry concerned? Where such a library exists, are its resources available to the technical staff, the designers and draughtsmen, and the accountants of the establishment, or are they locked up in the manager's room and jealously withheld from the hands of his subordinates? There may be on a shelf in the D.O. a few well-thumbed and dilapidated old friends such as Unwin's "Machine Design," Rankine's "Civil Engineering," and so on, but these only serve to emphasise the lack of an adequate modern reference library; and even if the books were there, would the draughtsmen be permitted to consult them freely and often, without incurring reproof for "slack-ing"?

It is our contention that in every such establishment a well-equipped technical library should be provided and carefully kept up to date, and that the engineering staff should be encouraged to make full use of it in the performance of their duties. The provision of duplicate copies of standard works, to be lent to the men for home study, would also be a wise procedure, and would abundantly repay the cost, comparatively trifling to the firm, but prohibitive to the junior members of the staff. The example of the Institution of Electrical Engineers, which has added to its magnificent collection of books a lending library for the use of its members, is well worthy of emulation; the system has proved highly successful, many hundreds of books being borrowed each year.

An Electroculture Committee.

DURING the past year or two considerable attention has been given in this country to the possibilities of electroculture in the shape of increased and improved crop production, and, in addition to the recognised experimental stations, many more or less experienced investigators have installed apparatus with a view to personally exploring what has for many years been an attractive, though little known, branch of electrical science. The war has undoubtedly been responsible for the sudden accession of interest in this subject, as in agriculture generally, but it has also added to the difficulties naturally attendant on such a situation. We have, for instance, often felt, and privately urged, that adequate steps should be taken to secure (1) co-ordination of effort amongst those engaged in these experiments, (2) that any neces-

sary knowledge gained by past experience in the operation of such installations should be in the possession of all investigators, and (3) that the results obtained and all essential data connected with the year's work should in every case be tabulated, so that they can readily be utilised in the interests of future progress. The case is distinctly one where the co-operation of all directly concerned will advance matters in the national interest, and for this reason the movement which is now understood to be taking shape for constituting a committee under the Board of Agriculture, on which engineering, scientific, and agricultural interests will be represented, with a view to securing the above object, as well as deciding on suitably-priced standard apparatus, and promoting investigation of the technical problems involved in the application of the electric discharge, must be regarded as a logical one, though somewhat unexpected.

Unfortunately, our experience of committees formed under the wing of a Government Department has been, up to the present, disheartening—the Board of Trade Electrical Committees are typical—and it would appear to be too much to expect that a department with a record such as that of the Board of Agriculture will not automatically follow established precedent, and in effect delay, instead of facilitating progress.

That the Board should support the formation of a committee in the public interest is a right and proper thing, but it should be understood that the results of its deliberations will be accessible to the public at any time, and that the Board's only interest is that of a Department of State paid by the public to receive and act on any recommendations made by the Committee.

The Board should exercise no control whatever over the findings of the Committee, and it should be a *sine qua non* that investigators, acting on behalf of the latter, have no proprietary interest in the results of their labour other than that to which they may be legally entitled.

The Board of Agriculture has for some years interested itself in a small way in electroculture, but we would ask whether it is not a fact that during the past year or so, public interest having been aroused, and the need for expert guidance having arisen, the Board's advisers—presumably with its concurrence—have obstructed rather than assisted the development of the movement, which is intended to place electroculture on an industrial rather than a laboratory basis?

To put the matter plainly, we question the utility of the proposed committee—which can only cover ground which is clearly within the scope of the existing I.M.E.A. Committee on the Development of Electricity in Agricultural Areas—and we hesitate to accept its suggested objects at their face value. The I.M.E.A., through its Agricultural Committee, has done more to promote the use of electricity in farming during the past six months than a Government departmentally-controlled committee would have accomplished in three years. This, together with the fact that the proposed committee will deal only with electroculture—which in itself will not for a few years be of so much importance to the farmer as the general applications of light and power—leads one to suggest that, instead of the Board going out of its way to form an overlapping committee to deal with matters already occupying the attention of an existing and much more practical body, it should give its whole support to the latter with a view to developing it into what it will, if its objects, mentioned in our issue of March 23rd last, are secured, become naturally, viz., a National Agricultural-Electrical Committee, with sub-committees representing all the various interests involved—electrical, scientific, agricultural, manufacturing, governmental, &c.

THE "EMPRESS WORKS" OF MESSRS. E. BROOK, LTD., HUDDERSFIELD.

AMONGST the younger firms engaged in the manufacture of electric motors, the firm of E. Brook, Ltd., occupies a

September 7th the firm had made 17,446 machines, aggregating upwards of 348,000 H.P., and the new works are already fully employed. The area occupied by the establishment is about $2\frac{1}{2}$ acres, 1,800 sq. yd. being available for extensions. The machine shop measures 168 ft. \times 163 ft., and has a floor area of 3,043 sq. yd.; iron and brass

FIG. 1.—IRON FOUNDRY.

FIG. 4.—WINDING BAY.

FIG. 2.—BORING AND TURNING MACHINES AND LATHES.

foundries are provided at the rear of the machine shop, the former covering an area of 120 ft. \times 10 ft., and the latter 40 ft. \times 25 ft., with a modern equipment of moulding machines, compressed air and sand-blasting plant, &c.

The accompanying views show the interiors of some of the departments, which are equipped with a variety of lathes, planers, boring and turning machines, radial drills, &c., in most cases with a separate motor driving each machine. The main bays are traversed by electric cranes, and portable cranes are provided in the winding shops, as well as electric lifts to the higher floors.

The test room is provided with a switchboard and transformers, which enable motors to be tested with one, two, and three-phase current at from 50 to 800 volts, 45 to 100 cycles per second; special braking appliances have also been installed to facilitate test runs.

prominent position. It was founded at Huddersfield in 1904, for the purpose of making single-phase motors and starting gear, and, from small beginnings, quickly developed, new premises being occupied in 1905 to accommodate the growing business, which was extended to include the manufacture of three-phase motors in the following year. Branch workshops and show-rooms were also opened at Leeds and London in 1911 and 1912, and numerous agents were appointed in British and Dominion centres.

In 1915 it was decided to erect a new works on up-to-date lines at Longroyd Bridge, and the factory was completed in May last, though the offices and some of the smaller buildings were not finished until last month. Provision has been made for the manufacture of motors up to 200 H.P., with an output of 50 motors of various sizes per week: up to

FIG. 3.—LARGE LATHES AND PLANERS.

The buildings are heated throughout on the low-pressure hot-water system, and in other respects special attention has been devoted to the welfare of the employes, with whom the management have always maintained most cordial and kindly relations: a canteen is provided, with hot-water supply and

FIG. 5.—TESTING SWITCHBOARD.

a well-equipped kitchen, comfortable dining rooms, and lavatories, and meals are served to about 100 employes daily: in addition, the canteen is opened for half an hour

FIG. 6. CANTEEN KITCHEN.

during the morning and again in the afternoon for light refreshments.

The new works were designed by Messrs. J. B. Abbey and Son, architects, Huddersfield, and were erected under their supervision; on Saturday last they were formally opened by Mrs. Ernest Brook, in the presence of a number of visitors.

Electric Steel Manufacture in Denmark.—A company has been formed in Denmark, with a capital of 600,000 kronen, for the manufacture of steel from scrap, which is being melted and refined, with a little new iron added. It is said to be the same process which the Krupp works use for the manufacture of their best guns. To commence with, the new undertaking will confine its work to the production of smaller articles, machine parts, &c. Scrap is said to be available in sufficient quantities, but up to now it has principally been exported to Sweden. The new company, consequently, is fairly independent of foreign supplies, which is a very important point under the present circumstances. Operations will commence probably by the end of November, and work is expected to be in full swing by the beginning of the new year. — *Engineering.*

THE FIXATION OF ATMOSPHERIC NITROGEN.

NITROGEN is one of the four elements indispensable to animal and vegetable life, and the average adult consumes from 10 to 20 grammes per diem in one form or another. It is a curious fact, however, that the majority of plants cannot abstract (or "fix") gaseous nitrogen from the atmosphere, but have to draw their supply of this element from nitrates in the soil. Nitrates thus consumed may be replenished by natural manures, but the tendency is to use, more and more extensively, artificial fertilisers containing nitrogenous compounds made by the fixation of atmospheric nitrogen. In addition to the practically illimitable demands of agriculture for nitrates, chemical industries use ever greater quantities and varieties of nitrogen compounds. The old conception of nitrogen as a particularly inert element has had to be modified since the electric furnace showed it to combine readily with many substances at temperatures exceeding 1,000° C., with the formation of compounds which have many valuable applications.

Sources of Nitrogen.—Nitrogen compounds exist in small quantities in the soil, and are a product of vegetable decay. A very small quantity of nitrogen (about 12 lb. per acre per annum in this country) is carried into the soil by rain, in the form of dissolved compounds produced by electrical discharges. The activity of various bacteria is responsible for withdrawing much larger quantities of nitrogen from the atmosphere, but still not nearly enough for the needs of modern agriculture (for instance, an average crop of wheat withdraws from the soil about 535 lb. of nitrogen per acre). The guano deposits in Peru and on the island of Majorca are exhausted, and it is unlikely that the Chilean nitrate beds would last for more than another century or so at the pre-war rate of consumption; nor is it likely that any other natural deposits of similar magnitude will be discovered. In view of the rapidly increasing consumption of nitrates, it is of immediate importance to see that artificial means are available for producing the whole of the requisite supply.

One industrial source of fixed nitrogen lies in the distillation of coal. The latter contains 1 to 1½ per cent. of nitrogen, and during distillation in a closed retort, 15 to 20 per cent. of this nitrogen is converted to ammonia. From 100 tons of coal there may be obtained about 1·2 tons of ammonium sulphate, containing 20 to 21 per cent. of nitrogen. This sulphate may be converted easily into nitric acid (for use in making explosives, dye-stuffs, perfumes, &c.), or it may be used as a fertiliser, and is then readily converted to nitrate in the soil. For some time this was the only industrial source of fixed nitrogen, but the quantity thus available is limited (especially whilst so much coal is burnt without by-product recovery), hence the attention which has been paid to fixing nitrogen from that inexhaustible reservoir, the atmosphere.

The world's production of sodium nitrate has ranged from 2,000,000 to 2,700,000 tons per annum since 1908; and the production of ammonium sulphate increased steadily from 852,000 tons in 1908 to 1,610,000 tons in 1913, since when no statistics are available. The increasing cost per ton of these materials formed an additional incentive to the synthesis of nitrates from atmospheric nitrogen, and great advances have been made in the technique of producing nitrogen compounds since the war brought about such an unparalleled demand for explosives. But for the proficiency attained by Germany in this respect, the war would have been ended before this by lack of explosives in the Central Empires. Germany imported more than 500,000 tons of Chile nitrates during the first half of 1914, but it is probable that none of the belligerents will import much Chile nitrate after the war. In other words, the fixation of atmospheric nitrogen is an established industry, meeting or capable of being extended to meet all requirements.

Fixation Processes.—Confining our attention simply to processes which are of proved industrial value, these may be divided into three main groups:—(1) Processes for the direct oxidation of atmospheric nitrogen—*e.g.*, Birkeland-Eyde, Schoenherr, and Pauling processes; and the Haussner process for exploding compressed gases. (2) Combination

of nitrogen with hydrogen to form ammonia, as in the Haber process. (3) Fixation of nitrogen on metals or metallic compounds—*e.g.*, Franck & Caro's process for fixing nitrogen on calcium carbide; and Serpek's process for fixing nitrogen on aluminium. Whilst the processes of group (1) yield nitric and nitrous acids directly, those in groups (2) and (3) lead to ammonia—*via* cyanamide or nitrates. Since nitric acid and its salts are of great importance, methods have been devised for oxidising ammonia and obtaining nitric acid with almost full theoretical efficiency.

Although almost the whole practical development of fixation processes has occurred during the past ten years, there were about 388,000 tons of nitrogen fixed during 1916, equivalent to about 2,450,000 tons of 15½ per cent. nitrate, a production equal to, or greater than, that of Chile nitrate during the same year. Before the American Electrochemical Society in April, 1916, the world's production of fixed nitrogen was stated as follows:—

Tons of fixed nitrogen in—	1913.	1915.
Oxidisation by arc	16,915	27,570
Haber process	7,300	54,430
Calcium cyanamide	59,490	190,000
	83,705	272,000

The data for 1915 are approximate, and certainly represent an underestimate; production was more than doubled during the year, and at the beginning of 1916 about 1 million H.P. was used for the synthetic fixation of nitrogen.

Direct Oxidisation Processes.—Although Franck and Caro's patents concerning the fixation of nitrogen on calcium carbide date from 1898, the manufacture of calcium nitrate by direct oxidisation of nitrogen was only brought to industrial perfection about the same time as the cyanamide processes. During 1903 the first Birkeland-Eyde equipments, of 25 and 150 H.P. respectively, were set to work, and since then the production of calcium nitrate by this process has increased continuously, and now amounts to 200,000 tons per annum.

At high temperatures (1,000° C. and over) nitrogen combines with oxygen to form nitric oxide (NO), but the action is reversible, and the speed of decomposition is considerably greater than the speed of formation. The concentration of nitric oxide in air exposed to suitable temperature (developed by the electric arc), is determined by the principle of mass-action, and, in order to reduce the proportion of decomposition, the air is blown quickly past the arc; once the gases reach a zone at 1,200° C., or lower temperature, the loss by decomposition of the oxide becomes comparatively small. Using air as raw material, the concentration of nitric oxide when equilibrium is established in the reversible action is 0·35 per cent. at 1,811° C. (absolute), 0·98 per cent. at 2,195°, 2·02 per cent. at 2,580°, 3·57 per cent. at 3,000°, and 4·39 per cent. at 3,200°. Equilibrium is never attained in practice, and gas leaving the furnace rarely contains more than 1 or 1½ per cent. of NO (Birkeland-Eyde, 0·5 per cent.; Schoenherr, 1·75 per cent.; Pauling, 1·2 per cent.).

The theoretical efficiency with air at the temperature of the electric arc (about 3,600°) is about 10 per cent., and on this basis 1 kw.-hour should provide 180 grammes of nitric acid and 1 kw.-year of 8,000 hours should yield 3,170 lb. of acid. In point of fact, industrial furnaces yield only about 1,230 lb. of nitric acid per kw.-year, corresponding to 3·9 per cent. efficiency, as a maximum. Schoenherr estimates that the energy consumed in his furnace for the oxidisation of atmospheric nitrogen is distributed as follows:—

Formation of NO	3 per cent.
Lost in furnace cooler	40
Lost by radiation	17
Recovered in boilers	30
Given to final cooler	10
	100

If a mixture of equal parts of nitrogen and oxygen be used, instead of air as raw material, the theoretical equilibrium-concentration of nitric oxide is increased by 25 per cent., and is considerably greater in practice: the theoretical production of nitric acid then exceeds

4,620 lb. per kw.-year, but the mixture of pure gases has never been used industrially.

Nitric oxide made as above is oxidised to nitric peroxide by the action of oxygen after cooling the gas to about 40° C. before admitting it to the oxidising towers. The peroxide is converted to nitric and nitrous acids by the action of water, and a residue of gas which cannot be converted to acid, owing to certain instability in the action, is recovered in a soda tower as sodium nitrite, a material which is essential to the dye-stuff industry. The 30 per cent. nitric acid is either concentrated or converted to calcium nitrate, which is a valuable fertiliser.

The Birkeland-Eyde Process.—The furnace used in this process has not been modified in any essential particular since its introduction more than 10 years ago.* The electrodes are placed in a magnetic field perpendicular to their plane, so that the arc is drawn out into the form of a half-disk. Where alternating current is used, the arc is formed alternately as two half-disks, which present the appearance of a complete disk. Single-phase current at 5,000 volts, 50 cycles is employed, and the cylindrical furnace-casing of sheet-iron is provided with perforated refractory bricks which divide the air supply into a number of streams. The electrodes are water-cooled, and a magnetic field of 4,500 to 5,000 c.g.s. lines per sq. cm. is maintained between them. About 10 per cent. of the total energy expenditure is absorbed by the field coils.

Whereas the first Birkeland-Eyde furnaces consumed only 600 kw., later ones consume from 1,000 to 4,300 kw. In the Saahm works there are eight 3,500-kw. furnaces in operation. The diameter of the arc flame in the latter case is about 8 ft. The temperature of the flame exceeds 3,000° C., but in spite of the high temperature to which they are exposed, the electrode ends need changing only once in three or four weeks, whilst the refractory masonry lasts from four to six months. Gases escape from the furnace at a temperature between 800 and 1,000°, and some of the heat which they carry is utilised to raise steam for concentrating the nitrate water obtained in another stage of the process. After leaving the boilers, the gases are cooled to 40° by passage through aluminium tubes on which water is sprayed. In successive towers filled with refractory brick, quartz, or other appropriate material, the cooled gases are oxidised to NO₂, which is combined with water to yield 40 per cent. nitric acid, and the residual gas is recovered in soda towers. The total absorption is about 97 per cent. of the nitric oxides formed. There are various alternative chemical processes for the production of different nitrogen compounds,† but the key process is the fixation of the atmospheric nitrogen. Dilute nitric acid may be concentrated, or combined with ammoniacal liquor to form ammonium nitrate; but it is generally used to make calcium nitrate. The yield of calcium nitrate amounts to 1,900—2,100 lb. per kw.-year, corresponding to 1,000—1,210 lb. of nitric acid.

The development of the nitrate industry in Norway has been extremely rapid, the pre-war progress being as follows:—

Works.	Date.	Total H.P.
Froguerkilem Fabrik	July, 1903	25
Ankerlokken	Oct., 1903	150
Vasmoen and Arendhal	Sept., 1904	1,000
Notodden	May, 1905	2,500
Notodden and Svaelffos	May, 1907	42,500
Notodden, Svaelffos, Lienfos, and Rjukan I	Nov., 1911	200,000
Rjukan II	1913	120,000

All these works are in the district of the R. Telemarken, and the total horse-power utilised for the fixation of nitrogen has increased from 200,000 H.P. in September, 1912, to about 300,000 H.P. at the present day. The Notodden Works produce, per annum, 20,000 tons of calcium nitrate, 4,000 tons of sodium nitrite, and 4,000 tons of ammonium nitrate. The Saahm (Rjukan I) works consumes about 100,000 kw.-years per annum, and pro-

* A detailed description is to be found in the *ELECTRICAL REVIEW*, January 9th, 1914.

† For details of these processes, and for many other chemical data relating to the fixation of nitrogen, reference may be made to *Genie Civil*, Vol. 70, pp. 319, *et seq.*, whence some of our present notes are derived.

duces 70,000 tons of calcium nitrate and 8,000 tons of sodium nitrite, *i.e.*, 1,540 lb. of calcium nitrate and 176 lb. of sodium nitrite per kw.-year, corresponding to 1,100 lb. of 96 per cent. nitric acid. The cost price of calcium nitrate is 86s. to 100s. per ton, and that of nitric acid (36° Beaumé) 150s. to 175s. per ton.

(To be continued.)

THE UTILISATION OF UNDEVELOPED FUELS IN PULVERISED FORM.

A RECENT issue of the *General Electric Review* contained an article on the above subject by Mr. V. Z. CARACRISTI, of the Locomotive Pulverised Fuel Co., portions of which, dealing with the question of steam raising, we reproduce below:—

High rates of combustion are, in large power plants particularly, of extreme economic importance, the capital investment being reduced in direct proportion to the rates of burning; nearly all of the accepted types of boilers are beyond the capacity of the furnace in their ability to utilise the heat generated in the furnace, and particularly when the boiler equipment is supplemented by economisers or other means of utilising the heat lost through high waste gas temperatures. Although owing to the small specific heat of the gases, in combination with the loss of efficiency brought about at low temperatures in the transmission of such heat to the water in the boiler tubes, the high stack temperature is not as great an economic loss as is popularly supposed.

The development work done in combustion through the use of stokers, in combination with under-grate blowers and re-torts, has about exhausted the possibilities in this direction, and a radical departure from the existing practice is necessary in order to utilise to the fullest possible extent the thermal energy of fuel.

The use of fuel in pulverised form offers a basis for further development work in this connection.

The fact that fuels having relatively high volatile contents, when dried and pulverised, are so readily combustible, has

FIG. 1.—BABCOCK BOILER WITH POWDERED FUEL FURNACE.

caused a great many experimental developments in this direction to be failures, particularly when efforts were made to maintain a rate of combustion in excess of that normally obtained through the use of stoker equipment having under-grate blast. It has, however, been demonstrated in service that it is possible to burn to CO₂ more than 98 per cent. of the combustible matter with an excess of air supply of less than 10 per cent., without any deductions for combustible in the ash, this being irrespective of the volatile or ash content of the fuel or the analysis of such ash. This result is being obtained at a rate of combustion equivalent to 175 lb. of coal per square foot of grate area per hour, and without the necessity of increasing the combustion space volume by high boiler setting; the CO₂ contents of the escaping gases under these extreme overload conditions being very close to the theoretic, and the CO content of the escaping gases being nil.

The use of pulverised fuel in stationary boiler plants when the installation is of sufficient size to absorb a reasonable amount of increased capital is justified for the following reasons:—

1. Ability to force the boilers, without loss of combustion efficiency, to a rating which will develop a horse-power for each four or less square feet of heating surface,

2. Greater heating value per cubic foot of furnace volume, eliminating the necessity for raising the boilers in order to secure overload capacity.

3. Reduction of the initial capital investment in the boiler plant on account of the reduction in the amount of heating surface in the boilers necessary to carry a given load under operating conditions.

4. Ability to maintain full steam pressure with low-grade fuels under extreme overload conditions.

5. Ability to utilise from 96 to 99 per cent. of the heating value of the combustible, irrespective of the ash content or analysis.

6. Elimination of grates and mechanical equipment for stoking and the maintenance incident thereto.

FIG. 2.—CAHALL BOILER WITH PULVERISED FUEL EQUIPMENT.

7. Elimination of draught blowers for the purpose of securing overload capacity.

8. Elimination of operating difficulties brought about by the clinkering of coal on grates, and the resultant loss in boiler capacity during periods of cleaning fires.

9. Ability to quickly take on heavy overload and to cut out the fuel feed when the necessity for such overload has ceased. The cutting out of the fuel feed in a pulverised fuel installation instantly stops combustion and the use of fuel, whereas in a grate-fired installation the amount of coal remaining on the grates is of necessity lost.

10. Elimination of the necessity for keeping banked fires in order to take care of irregular peak loads. With the use of pulverised fuel steam from cold water can be raised to working pressure as quickly as from a banked fire.

FIG. 3.—BADENHAUSEN BOILERS ARRANGED FOR BURNING POWDERED FUEL.

11. Elimination of smoke from the stack and the consequent freedom from liability under legislative requirements as to the smoke nuisance.

12. Reduction in the size of the buildings necessary to hold the boiler equipment, together with a reduction in the cost of the steam and water piping in the boiler room.

13. Material reduction in the height of the stack, this reduction in height being brought about by the fact that all of the air admitted to the firebox passes direct into the combustion zone, without the necessity of passing through a fuel bed, permitting the boiler to be operated under an overload with less vacuum.

14. Reduction in the cost of operation, brought about by the fact that the feeding of pulverised coal to the furnace requires practically no attention.

15. Reduction in the cost of handling ashes, brought about by the greatly reduced volume.

As an offset to the above advantages may be set up the cost of preparing the fuel for burning in pulverised form.

The expense of properly preparing the fuel may be divided into four divisions:—

First. The expense of crushing the coal, freeing the coal from stray iron, and elevating the same to bins, preparatory to pulverising.

In so far as this equipment is concerned it is the same as would be required in hand or stoker fired installations.

Second. The cost of drying the coal.—With equipment which is commercial the coal can be freed from moisture at a reasonable power and fuel expense. The power and fuel required are greater with lignite than with anthracite or bituminous coal, bituminous coal being more easily dried than either of the other fuels.

Third. The power required to pulverise.—Although accurate figures are not available, the power required to pulverise coal to a fineness necessary for combustion in suspension, with commercial equipment as manufactured at the present time, is from 8 to 9 kw.-hours per ton for bituminous coal and lignite, and from 15 to 17 kw.-hours per ton of coal for anthracite or graphitic coals and coke breeze.

Fourth. The maintenance of equipment necessary to prepare fuel.—The maintenance on the equipment for the preparation of fuel will be approximately, using present com-

An item of prime importance is to operate the firebox under a vacuum. This vacuum can be as low at 15/100 of an inch of water. It is also of importance that auxiliary air for combustion be induced into the firebox in or near the zone of maximum temperature.

Burning pulverised fuel at high rates of combustion and in large volume tends to form a layer of CO₂, preventing the access of oxygen to the unconsumed core of the flame, and unless this core is broken up by cross currents it will pass into the cold area surrounding the boiler tubes, and combustion will not be completed.

The matter of combustion of pulverised fuel within a limited space of firebox is controlled by an element of time, and the slower the passage of gases through the firebox the more efficient the combustion results.

The items which affect the combustion of pulverised fuel are:—

- 1. Volatile contents, affecting the temperature of the flash point.
- 2. The degree of fineness to which the fuel is pulverised.
- 3. The amount of moisture in the fuel.

Low volatile contents can be offset by increasing the fineness of the fuel.

The amount of moisture in the fuel is of only minor importance in so far as combustion is concerned. The reduction of moisture affects the thermal results only slightly, and the combustion practically not at all; from which fact it can be noted that the higher the volatile content of the fuel the less is the expense necessary for pulverising.

The formation of honeycomb and clinker on the heat-absorbing surfaces is brought about largely by the iron con-

FIG. 4.—PULVERISED FUEL FEEDER.

mercial equipment, from 2 to 3 cents per ton for bituminous and lignite coals, and from 4 to 5 cents per ton for anthracite and coke breeze.

The cost of preparing and pulverising, however, should not be considered as an operating charge. This cost is directly chargeable against the cost of fuel, and in determining the savings which can be effected by means of burning pulverised fuel in suspension, this cost should be added to the cost of the fuel on a B.T.H.U. basis arrived at. When making a comparison of the cost of fuel on a B.T.H.U. basis in terms of evaporating results, when burned on grates and in pulverised form, it is conservative to figure that the combustion results will be from 20 to 30 per cent. better with pulverised fuel. This increase in combustion results will be sufficient to more than offset the cost of pulverising, leaving the difference in saving in cost per B.T.H.U. due to the less price for the lower grade fuel as a net saving.

There is a considerable field for the development of equipment necessary for the drying and pulverising of fuel, but under the present commercial conditions the cost of preparing fuel is not prohibitive, even when considering the use of low-grade fuels having a high ash and low B.T.H.U. content.

When the necessary air for combustion is introduced into the firebox the direction of the flame is toward the openings and the firebrick has to stand the radiation effect of the heat only, and is relieved of the scouring action.

The process of burning pulverised fuel differs from the process of burning gases arising from coal burned on grates or the burning of fuel oil, in the fact that the temperature of the ash in suspension, when burning pulverised fuel, becomes great enough to make the process of combustion self-sustaining, reducing to a minimum the necessity for heat radiating or regenerating refractory surfaces when the velocity of the flames through the combustion space is not too great. It is essential that feeders be of such a design that they will deliver from 3,000 to 5,000 lb. of pulverised fuel per hour; and that the pulverised fuel handled by the feeder will be thoroughly intermingled with the air used as a conveying medium. It is also essential that the velocity of the fuel entering the firebox be less than the velocity of the combustion air surrounding this fuel inlet.

Experience has demonstrated that it is very practicable to burn, within a very limited space, 5,000 lb. of coal per hour fed by one burner, the fuel being converted into gases within the distance of less than 10 ft., provided the incoming mixture is uniformly distributed throughout the cross section area of the delivery pipe, so that a refractory wall located a distance greater than 10 ft. from the fuel inlet will be free from any impinging or cutting action of the flame.

tent in the ash, and can be prevented by a through oxidation of such iron in the combustion zone.

The formation of slag in general will be in direct ratio with the amount of incandescent surface with which the ash in suspension has an opportunity of coming into contact. The ash in suspension which does not come into contact with incandescent surfaces will readily pass out of the stack in extremely minute particles in the form of a very light haze, a small proportion remaining in any eddies which the boiler setting may cause in the passage of the gases to the stack, and the use of horizontal baffles should be avoided.

TRADE IN CANADA.

Influence of Capital.—In his report for the year 1916, H.M. Trade Commissioner in Canada (Mr. C. Hamilton Wickes) draws attention to the relative yearly investment of British, United States, and Canadian capital in Canadian Government, municipal, railway, and corporation bonds during each of the years 1909 to 1916. The estimated figures are as follows:—

Years.	United Kingdom, Per cent.	United States, Per cent.	Dominion of Canada, Per cent.
1909	74.00	3.90	22.10
1910	81.50	1.50	17.00
1911	76.56	6.58	16.84
1912	72.65	11.35	16.00
1913	74.25	13.65	12.10
1914	68.25	19.75	12.00
1915	14.20	42.10	43.70
1916	1.50	64.90	33.60

Last year Canada sold \$316,000,000 of such bonds, of which United States investors purchased \$205,000,000. It will be noted that up to the year 1912 the investment of United States capital was practically negligible, while the United Kingdom supplied about 75 per cent. of Canadian requirements until the outbreak of war. During the period 1909-14 no great effort appears to have been made by the manufacturers and merchants of the United Kingdom to improve their trade in the Dominion as a direct consequence, or as a condition of these immense investments. With the investors of the United States it is different. In the majority of cases it is made a condition of the contract that the funds so advanced shall be expended on plant, machinery, and goods produced

in the United States, and to this end their bankers and manufacturers have combined their efforts. The commercial advantages thus obtained will be difficult to modify so long as present financial conditions prevail.

In Ontario, however, sentiment is strongly in favour of the purchase of Canadian and British goods. This sentiment seems to be taking the place of the more restricted campaign, prominent in 1915, urging the purchase of "Made in Canada" goods.

Complaint is still heard occasionally as to the lack of personal attention given by British manufacturers to the requirements and details of this market, as compared with the attention given by United States manufacturers. There is a personal touch in evidence in United States trading relations with Ontario which helps considerably to increase that country's volume of trade. This personal touch extends to constant effort on the part of manufacturers to obtain orders, following the raising of loans by Canadian borrowers in the United States.

The Ontario Hydro-Electric Commission will again be a large buyer of motors, copper wire, insulators, sluice gates, generators, and power plant during 1917. It has hitherto purchased its current from corporations at Niagara Falls, but has now decided to build its own power generating plant, construction of which will probably be commenced at an early date. The Commission will also be a large buyer in the comparatively near future of electric railway plant and material in connection with a scheme of electric radial railways throughout the Province.

Trading Hints.—The manager of one of the most important metal and hardware firms in the West, in speaking of the desire of his firm to deal more largely in British goods, testified to the value and usefulness of many articles of United Kingdom manufacture. In common with nearly all other business men, however, he spoke of the difficulties attending the development of British trade in Western Canada. It was generally remarked that British firms, with the exception of some striking examples to the contrary, are ill-informed as to what the West can buy and use, and of the terms and conditions which Canadian firms find it necessary to employ in the conduct of their business. Prior to the war, many British manufacturers, quite unconsciously no doubt, gave Canadian buyers the impression that they did not want to effect sales, by their habit of writing back referring inquirers to "an export agency," or, if the orders were accepted, by being dilatory in shipping the goods. Attempts by British firms to open up business in a manner which hindered instead of helping towards the desired end were also remarked upon.

In appointing agents to represent them in Canada, British firms should investigate thoroughly the standing and reliability of the persons whom they contemplate employing.

The majority of Canadian importers, in goods handled directly or indirectly through the retailer, look for credit of 30, 60, or 90 days, customarily extended by the established American manufacturers. It is vain for British manufacturers of such goods to insist on "cash before documents," much less as some do, "cash before shipment." If the United Kingdom trader is to regain the trade which has been partly lost during the war he must ascertain the terms, and be prepared to allow equal terms, as regards credit, with manufacturers of similar goods in the United States.

The use of the cables, when business is being put through, is important. It is to be remembered that the principal centres of industry in the United States are only 12 to 24 hours' distant from Montreal and Toronto, and that business can be closed up by a personal interview between the seller in Chicago and the buyer in Montreal weeks before a letter on the same subject can go back and forth to the United Kingdom.

British shippers should make themselves familiar with Canadian Customs regulations and tariffs. Invoices must always be made out in triplicate and attached to bill of lading, and each invoice must contain the necessary clauses on the back in accordance with Customs regulations. Failure to forward these documents prevents the removal of goods from bond, causing great inconvenience and expense.

In making prices to possible customers, it is a great advantage to quote in Canadian currency, giving the fullest possible details as to terms, discounts, packing (how many in a case, &c.). Such terms as "c.i.f.," "f.o.b.," &c., are used very loosely on this side, and it is advisable—at the risk of what may appear redundancy—to make one's meaning perfectly clear. For instance, "f.o.b. Liverpool" might be rendered free of all possible chance of mistake by saying "Free on board steamer at Liverpool, ocean freight and insurance to be paid by the buyer," or "c.i.f. Montreal" might be made more specific by saying "Cost, insurance, freight to Montreal, delivered ex ship."

Catalogues, price lists, advertising cards, or any printed matter designed to attract the Canadian public should be expressed in dollars and cents, and not in British currency.

United Kingdom firms wishing to open up or extend business in Canada must realise that they have to face strong American competition. In Southern Ontario and Niagara Peninsula this is especially the case, and a large number of United States manufacturers have works or assembling arrangements in that district which are backed by strong selling organisations.

Many wholesale dealers insist that cheapness is by no means

the determining factor in the Canadian market. It gives place to selling capacities, and to the tastes and requirements of the ultimate purchaser. They also complain that United Kingdom travellers are often so engrossed in the superiority of the article they carry as not to realise that intrinsic value is only one factor in the popularity of a commodity, and while the Canadian wholesaler is ready to acknowledge superiority where it exists, he is more concerned to find goods that will sell themselves and entail little or no education of his selling staff or the general public. Manufacturers should make the article the public require, and follow this by organised distributive effort. It should be understood that United States firms send well-trained salesmen into Canada in large numbers, and salesmanship being highly developed in the United States it must be met by selling ability of an equal or higher calibre on the part of United Kingdom manufacturers, particularly by firms wishful to introduce their goods, and also by those who desire to maintain and develop their existing trade.

THE ASSOCIATION MOVEMENT.

By HERBERT H. BERRY.

IN the leading article in the last issue of the *ELECTRICAL REVIEW* tribute is paid to the founders of the Cable-Makers' Association. As I believe there is no official record, I venture to give a short account of the creation and establishment of the existing C.M.A.

Some of the earlier years of my life were spent in acquiring a practical knowledge of the manufacture of electric cables of almost every description. I was fortunate to include in my experience a wide range of work, from a submarine cable which lies to-day across the bed of the Atlantic, down to the smallest leading-in wire used in an electric light installation.

I cannot appraise too highly the utility of my early experiences gained in the workshops and estimating department of Messrs. Siemens Bros., of Woolwich.

In 1894 I started business on my own account, and shortly afterwards, having a desire to turn my early training to account, acquired the sole selling agency in Lancashire, Yorkshire, Cheshire, Birmingham, and the Midlands, for the cables manufactured by the company I had lately left. But alas! competition, internal and foreign, became excessive and burdensome, and manufacturers were faced with the necessity to sacrifice quality or lose their turnover. I realised that a combination of British interests was the only logical outcome, and that good standard quality with a British hall-mark was a goal worth winning.

That was 20 years ago. An earlier effort had been made to bring all the cable makers together, but the result was unsuccessful.

After a preliminary conversation with my old chief, Mr. J. J. Easton, my first interview was with Mr. Alexandre Siemens, who listened sympathetically to my plans, but at the same time expressed the opinion that such a combination of interests in the electrical trade would, if created, have a short life, and, at the longest, last for six months. I was unable to obtain an authoritative statement from him that his company would join any such general movement, but he said he would be willing to discuss the matter further with me after I had interviewed other interested parties. This was not a very encouraging start. I had to plough a lonely furrow, and, incidentally, to bear the whole expense.

During the following weeks I spent my whole time traversing the country, interviewing the parties chiefly interested. One of these at least has, I regret to say, joined the Great Majority; others have retired from active interest in the electrical industry. With one exception, obtained the whole-hearted support of the cable-making trade, and the little opposition that presented itself soon vanished. From that time onward, members of the Cable Makers' Association have developed their manufacturing resources, improved their standards, and attained a degree of prosperity to the general advantage of the whole electrical community. At the period of the outbreak of war the financial records of the electrical cable industry were the envy of the electrical manufacturing fraternity, and the

one bright star in a firmament overclouded through foreign competition upon unequal terms.

I would like to repeat some significant remarks upon this subject made by Mr. James W. Gerard (late U.S. Ambassador in Berlin) in his *Daily Telegraph* articles. They are as follows:—

Combine for Selling Abroad.—The only thing that can maintain a fair price after the war for the products of American firms, miners, and manufacturers, is permission to combine for selling abroad.

With the low wages paid to very efficient working men, who worked long hours, and with no laws against combination, it was always a matter of surprise to me that the Germans, who were in the process of getting all the money in the world, should have allowed their military autocracy to drive them into war.

Trust and Cartel.—I am afraid, after this war, if we expect to keep a place for our trade in the world, that we may have to revise some of our ideas as to so-called trusts and the Sherman law. Trusts or combinations are not only permitted, but even encouraged in Germany. They are known there as "cartels," and the difference between the American trust and the German cartel is that the American trust has, as it were, a centralised Government permanently taking over and combining the competing elements in any given business, while in Germany the competing elements form a combination by contract for a limited number of years. This combination is called a "cartel," and during these years each member of the cartel is assigned a given amount of the total production, and given a definite share of the profits of the combination. The German cartel, therefore, as Consul-General Skinner has aptly said, may be likened to a confederation existing by contract for a limited period of time, and subject to renewal only at the will of its members.

It may be that competition is a relic of barbarism, and that one of the first signs of a higher civilisation is an effort to modify the stress of competition.

The German Courts have expressly said, if prices are so low that the manufacturers of a particular article see financial ruin ahead, that formation of cartels by them must be looked upon as a justified means of self-preservation.

The object of the American trust has been to destroy its competitors; the object of the German cartel to force its competitors to join the cartel.

Closely following the inception of the Cable-Makers' Association, my partner and I deemed it desirable to set on foot a co-operative movement amongst electrical manufacturers of accessories, and, having regard to the initial success of the C.M.A., collaborated with Mr. Bevis, of the General Electric Co., Ltd., who had conceived a similar idea, and we jointly founded the National Electric Manufacturers' Association. It is common knowledge that this Association was finally transformed into the British Electrical and Allied Manufacturers' Association, whose record, achieved since the outbreak of war, under the able secretaryship of Mr. Dunlop, is unparalleled, and must bring lasting and uplifting benefit to the industry.

My principal object, however, in writing now is to state that I am making an effort to co-ordinate the efforts of the many Trade Associations which now exist. As a first step, I have approached the Council of the Institution of Electrical Engineers, soliciting their support, and asking them, as the parent institution, to offer kindred institutions and federations the hospitality of their roof for joint meetings, which it is always desirable should be held upon neutral ground. I am glad to say the Council have favoured the suggestion and taken steps to put the resolution into immediate effect. This is a step for which the whole trade have cause to express gratification, and I am sure the premier Institution will benefit by the broad policy it has decided to adopt.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Electricity Supply Meters and Fuses.

A few suggestions on a somewhat neglected topic may not be out of place. The relation between a supply authority's meters and fuses is a most important matter if the meters are to have their just treatment. In all distribution systems the supply authority has a fuse on each consumer's premises, commonly termed "main" fuse. The main fuse is a protection for the meter so long as the size of the fuse is determined by the current capacity of the meter. A percentage overload should be allowed, say the fuse to be 150 per cent. to 200 per cent. the current capacity of meter, the latter figure to apply to power consumers. Rules to this effect, if not entirely

lacking, are not sufficiently enforced to be made effective. Many main fuses have been found, the fusing current of which was 20 times the full load meter current; by their proportions they seemed capable of protecting the power station only. A piece of 24/30's stranded copper wire, and a large hair-pin, are two recently found "fuses" supposed to be protecting 5-ampere circuits.

Consumers should be encouraged to keep their fuses of a less capacity than the main fuse. This point is practically solved by charging consumers a small fee whenever the main fuse has been burnt out or tampered with. The subject is worthy of serious consideration since a burnt out or damaged meter may cost for repairs anything up to 50 per cent. of its initial price, if at all repairable.

Small meters also suffer ill-treatment, in cases where they are used on lighting loads, the consumer also having a large power load. Almost without exception the lighting meter is connected through the same main fuse as the power meter. A quite common case is a 5-ampere meter connected through a 200-ampere fuse.

Thus the lighting meter is at the mercy of the consumer's fuse, which very often is the first piece of conducting material found that will fit into the fuse holder. Why not a separate main fuse of the required size? The meter is surely worth this small extra outlay. Many cases have occurred where the meter was entirely destroyed.

If the foregoing points were given a little more thought they would considerably reduce meter renewals funds and also relieve meter departments of a good deal of worry. Even small matters should carry weight in the "reconstruction" time.

H. G.

The E.T.U. and the A.E.S.E.

As one who has joined the A.E.S.E. and tried to join the E.T.U. I think my opinion may be of interest.

As to the A.E.S.E., it simply seemed to fizzle out; I was certainly not informed of its being suspended owing to the war.

In regard to the E.T.U., at present there does not seem to be any organisation for dealing with shift engineers in the provinces.

I believe that if only these two associations could amalgamate they would form a really strong union. There is a desperate need for one. The point to remember is that the organisation would have to deal with a number of scattered members.

I think the situation may be summed up in the words, "United we stand, divided we fall."

Shift Engineer.

At last the station engineers have a live organisation—namely, the Station Engineers' Branch of the "Electrical Trades Union." Its membership is very large, and is rapidly increasing. There are three branches in London, and a fourth and fifth will open in a few days. Station engineers' branches have also been established at Birmingham, Glasgow, Liverpool and Manchester.

These facts should convey to those who at present are not members that the station engineer has realised the advantages of allying himself to an efficient and sound body who study his best interests.

The long-dormant A.E.S.E. realise that it is time for them to wake up, but their tactics *re* conferences are certainly not shrewd or well-planned, as an effective organisation will not tolerate any interference of a body that has been asleep for two years.

The "status craze," although it still lingers, is developing broadly on democratic lines, and the station engineer finds that whilst the A.E.S.E. is still yawning, the E.T.U. has drawn up a "Schedule of minimum rates for station engineers," and negotiations are at present in progress for its adoption, combined with a war wage.

We welcome Mr. W. J. Ebhen and his colleagues of the A.E.S.E. to join us as members of the E.T.U., when we can greet them as brothers in effort and brothers in our assured success.

Charles W. Barnes,

Secretary, No. 2 Branch London Station Engineers,
Electrical Trade Union.

Lack of united organisation in the past is the cause of the low money paid to station engineers.

The A.E.S.E. have been in existence, and supported by central station and sub-station engineers, for a number of years without any apparent result regarding a general increase of wages.

The E.T.U. (who have drawn up a trade card for London with definite rates for shift engineers, switchboard attendants and sub-station attendants) after about eight months, have now in London alone the support of about 700 station men of all grades, many of them former members of the A.E.S.E.

The A.E.S.E. have been roused from inactivity through the E.T.U. successfully bringing their trade card before Sir George Askwith, and their resuscitation at this particular time would seem to indicate a recognition of the strength of the E.T.U. station engineers, and a desire to be included in any award the E.T.U. may obtain, without associating with a Union which is open to their (sometimes better paid) assistants.

Since every man in a power station performs his respective and necessary duties, and the shift engineer is dependent on his assistants for the satisfactory running of a shift, there can be nothing derogatory for a shift engineer to be in the same Union with his men. In some stations drivers are appointed shift engineers when vacancies occur, consequently a Union composed of shift engineers alone must be less potent than one embracing all grades of staff.

The shift engineer has status, staff and responsibility and is expected by his chief to be dignified. His remuneration, however,

is neither consistent with the responsibility, commensurate with the danger, adequate for maintaining status, nor compatible with dignity. What discipline could be maintained by a foreman whose men earned more or as much as he? And what dignity could a chief engineer maintain if his salary were not greater than that of his assistants?

The shift engineer's position is very difficult and absolutely anomalous: indeed, I know of no parallel in any other occupation, and the sooner we all unite in one organisation the sooner we may hope for better conditions.

Since both E.T.U. and A.E.S.E. have the same end in view, success would probably be hastened by joint action instead of being at loggerheads as apparently they are now.

October 8th, 1917.

Engineer-in-Charge,
I.E.E. and E.T.U.

Instructions to Meter Readers.

It hardly appears from Mr. Withey's letter that he can have had very much experience in dealing with a staff of meter readers, or of the class of conversation they are likely to have with consumers. I can assure Mr. Withey that such conversation is much more likely to consist of opinions that the meter is 200 per cent. fast, or the voltage 25 per cent. below normal, than of inquiries that would greatly interest the Publicity Department. The business of meter reading, moreover, is one that is usually required to be carried out in the smallest possible time, and the suggestion that meter readers should combine a sort of half-hearted canvass with their proper duties can scarcely be regarded as practicable.

London, E., 5th October, 1917.

G. W. Stubbings.

Accountancy in Small Undertakings.

There has been in the last few years a great increase in the number of village and small town electricity schemes. Many of these are run by small companies of local people, the clerical work being undertaken as a part-time job by some local man with an aptitude that way. An experience of the writer may be of interest in this connection.

In the case under notice the engineer happened to see, quite by chance, a draft of the balance-sheet which the secretary had prepared. He saw that the financial results as presented thereon were very seriously incorrect, and, on looking further into the matter, found one of the items under "Running Expenditure" to be extensions to plant! Further, under the heading of "Repairs and Maintenance" were included scores of pounds' worth of new poles, wires, and meters used in extending a supply to absolutely new customers. The secretary, on being remonstrated with, admitted that all these things were an addition to the assets of the concern, but could not be induced to alter the sheet. At a meeting of the directors the matter was brought up by the engineer in his own interest, as the real maintenance costs had been quite normal, or rather on the low side. In the same case, also, the amount of gross profit had been given to the income-tax collector as net profit, causing the company to pay double what it should have done for three years' running.

All this was admitted by the directors, but the suggestion that a chartered accountant should be paid a fee occasionally to overlook the accounts—a fee which would have been repaid many times over by the money lost to Inland Revenue—was not accepted. The natural effect on that engineer is this—that he feels that, however well he may do in keeping down costs, the credit due to him is liable to be effectually obliterated by faulty accountancy over which he has no control, and he is on the look-out for a position where striving for efficiency will bring him more appreciation.

I do not know whether any others of your readers have encountered this difficulty in these small concerns.

Country Mouse.

LEGAL.

THE KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING CO., LTD., AND THE NOTTING HILL ELECTRIC LIGHTING CO., LTD.

The following is a copy of the award of MR. JAMES SWINBURNE, F.R.S., the arbitrator in this case, the hearing of which was reported in the ELECTRICAL REVIEW for July 20th, p. 58.

"With regard to the Kensal Town supply, I find that:—

"1. Clause 3 of the agreement of 1900 means that the respondents are to take from the joint station at Wood Lane all the electrical energy over and above that generated by its own generating station at Bulmer Place that they require.

"2. Though the privileges granted by the Kensington and Notting Hill Act of 1899 were not specifically extended by the Act of 1909 the companies are justified in taking energy from Wood Lane for the supply of fringe consumers: and the agreement of 1900 binds them to do so, as long as any of the stock mentioned in it is outstanding, to the full extent to which they would have been bound had the Act of 1899 specially entitled them to use Wood Lane supply for fringe or outside areas.

"3. The respondents' business is all their supply of electrical energy, including any supply of energy which was not, or is not, duly authorised by Act of Parliament.

"4. The respondents make no secret of taking energy from outside sources; but the claimants did not know, or its officers did not realise, until recently, that this involved any question arising out of the agreement of 1900; and the claimants did not recommend taking outside supply, nor did they condone any infraction of the agreement. The claimants have suffered damage.

"5. By the agreement of 1900, so long as any of the stock shall be outstanding, each of the two companies shall from time to time take from the joint station all such electrical energy, in excess of that generated in its own station or stations existing within what was its statutory area in 1900, as such company may require for the purpose of supplying energy in accordance with the provisions of the principal agreement or such other provisions as may from time to time be agreed upon between the two companies or settled unanimously by the Committee.

"6. In accordance with 1, 2, 3, and 4, the respondents shall pay the claimants the sum of £189 (one hundred and eighty-nine pounds) damages in respect of the supply in Kensal Town in 1909; and in respect of the costs of this branch of the reference, a sum equal to one-tenth of the total taxed costs of the claimants, in the whole of the proceedings before me. But if it should be held that I am wrong in my view of the construction of the agreement concerning the supply in Kensal Town in 1909, the respondents shall not pay the said £189 or corresponding costs and the claimants shall pay the respondents a sum equal to one-tenth of the total taxed costs of the respondents.

"7. In accordance with 1, 2, and 4, the respondents shall pay the claimants the sum of £1,661 (sixteen hundred and sixty-one pounds) damages in respect of the supply in Kensal Town since 1909, including 1916; and in respect of the costs of this branch of the reference, a sum equal to seven-eighths of the total taxed costs of the claimants in the whole of the proceedings before me. But if it should be held that I am wrong in my view of the construction of the agreement concerning the supply in Kensal Town since 1909, the respondents shall not pay the said £1,661 or corresponding costs and the claimants shall pay the respondents a sum equal to seven-eighths of the total taxed costs of the respondents.

"8. With regard to Hammersmith, I find that:—

"(a) It is my duty to deal with this question, and I treat it as if it were a separate arbitration, its cost being 1-40th of the whole taxed costs.

"(b) The supply at Hammersmith is a breach of the agreement of 1900; and Clauses 1, 2, 4, and 5 of this award apply to this case also.

"(c) In accordance with 1, 2, and 4, the respondents shall pay the claimants the sum of £50 (fifty pounds) damages in respect of the supply in the Hammersmith district up to and including 1916; and in respect of the costs of this part of the reference, a sum equal to 1-40th of the total taxed costs of the claimants, in the whole of the proceedings before me. But if it should be held that I am wrong in my view of the construction of the agreement concerning the supply in Hammersmith, the respondents shall not pay the said £50 or corresponding costs, and the claimants shall pay the respondents a sum equal to 1-40th of the total taxed costs of the respondents.

"And I further award that the costs of the award be paid by the respondents if my award of £1,900 damages holds good. If not, it shall be paid by the respondents in the proportion of the damages payable by them, the rest being paid by the claimants."

TRAMCAR PASSENGER'S INTERFERENCE.

At Sunderland Police Court on the 5th inst., Alfred Coates, an electrical engineer, was charged with having interfered with an electric switch on one of the Corporation tramcars. The Deputy Town Clerk said defendant was a passenger on a tramcar, and while the car was running along Kayll Road the motorman felt it coming to a standstill. He went to the back of the car to ascertain the cause and found the conductress holding the defendant. She complained that the defendant had knocked out the switch. Accused was fined 10s.

The British Engineering Standards Committee and Anglo-American Co-operation.

—The American Institute of Electrical Engineers has very cordially accepted the Committee's invitation, and has appointed Mr. H. M. Hobart, M.Inst.C.E., M.I.E.E., as the delegate of its Standards Committee to confer with Sir Richard Glazebrook's Panel Committee on the Standardisation Rules for Electrical Machinery, and it is a pleasure to be able to announce Mr. Hobart's safe arrival in this country. The chairman of the British Engineering Standards Committee, Sir John Wolfe Barry, K.C.B., and Sir John Snell, chairman of the Sectional Electrical Committee, will welcome Mr. Hobart on Wednesday, October 17th, the first day of the Rating Conference.

Moreover, Mr. Hobart's presence in England will afford an opportunity for consultation in regard to the standardisation of electrical apparatus generally, in connection with which much work is being carried out by various Panels of the Committee, especially in respect of motor starters, ship's fittings, fuses, instruments, and instrument transformers, under the direction of Mr. C. H. Wordingham.

As on the previous occasion at the Rating Conference, the Canadian National Committee of the International Electro-technical Commission has invited Mr. A. P. Trotter to represent it.

WAR ITEMS:

From the Front.—A correspondent with the Forces in France writes as follows, under date October 1st:—"I write to acknowledge with my very best thanks the receipt of the REVIEW, which arrives regularly on Monday evening. It is very much appreciated by 15 electrical men here, and every Monday I am reminded by all of them: 'Don't forget to let me see the REVIEW, will you?' All the articles are read and duly discussed, the 'Lighting and Power Notes' are carefully digested, and finally the advertisements are gone through. Before the arrival of the paper I am always prepared to bet that Silvertown advertisement will be on the back cover, Davis & Timmins's on the last page, and so on. It is quite amusing to see how childlike we all become out here. There is some excuse, however, as the life is rather monotonous. We are getting a nightly visit from the Huns at present, and he doses us liberally with scrap iron; he gets a warm reception every time, though, I can assure you. Once again thanking you on behalf of all the electrical men here for your kindness, and hoping it will not be long before we are all buying our own REVIEWS again in dear old Blighty."

Chemical Trades After the War.—The Minister of Reconstruction has appointed a committee to advise him as to the procedure which should be adopted for dealing with the chemical trades after the war. Sir Keith W. Price, of the Ministry of Munitions, is chairman of the Committee. It is stated that Dr. Addison has requested the Committee to conduct their deliberations with a view to the creation of some organisation which should be adequately representative of the trade as a whole, and by means of which the trade may be enabled hereafter to continue to develop its own resources and to enlist the closest co-operation of all those engaged in the chemical industry.

Reconstruction in Russia.—An Economic Council and a Central Economic Committee have been instituted, attached to the Provisional Government, for the purpose of drawing up a general plan of economic and labour organisation and for the elaboration of legislative and other measures for the regulation of the economic interests of the country. A sum of 200,000 roubles is assigned for preliminary expenses. The decisions of the Economic Council must be confirmed by the Provisional Government. The Council will be a permanent and salaried organisation. The Central Economic Committee is to co-ordinate measures introduced by separate departments and institutions for the regulation of the economic interests of the country. It will also co-ordinate measures in the different branches of trade and industry. A full statement on the matter by H.M. Commercial Attaché at Petrograd will be found in the *Board of Trade Journal* for October 4th.

The Machinery Trade After the War.—Notwithstanding the release of a large number of the factories now engaged upon war munitions as soon as peace has been proclaimed, there is some doubt about the ability to replace in anything like sufficient quantity or time the immense amount of machinery that will be required. During the last two years it has been difficult to obtain from European manufacturers new machinery of any kind, while, since the United States came into the conflict, the same lack of ability to fulfil South American orders has been manifest from this direction. Important repairs have had to be postponed, and an enormous quantity of existing machinery will have to be "scrapped" and replaced by entirely new installations. A leaf might well be taken, by our larger manufacturers of machinery and equipment, out of the book of our keen rivals, the North Americans, who, in order to grapple with the unprecedented demand after the war, have already formed among themselves what is known as the "Allied Machinery Construction Corporation," which represents a group of leading, but non-competing, manufacturers of construction machinery, and who, taken together, produce all of the main types of such equipment. The group, however, excludes concrete mixing and distributing plants, steam and other power shovels and excavating machines, trench and ditch-digging machines, grab buckets, hoisting engines, light railway lines, light locomotives, and cars of all types, and a great variety of similar special equipment. We have something of the kind already in the machine tool trade, and further developments would undoubtedly prove beneficial. From the inquiries that have been pouring into the different factories for many months past, and which can only be satisfied in full when normal conditions are again restored, it would appear that the greatest demand for South America will be in the following lines:—Machine tools and sugar-cane machinery, all kinds of labour-saving construction machinery, agricultural machinery and implements. It is thought that a few smart and enterprising travellers, representing the great manufacturers of the specialties mentioned, could do a very prosperous business in both South and Central America if a move in combination were made at the earliest moment. One traveller, for instance, might act as the agent of a dozen, or even more, non-competing firms, thus minimising the expense and securing co-operation for some considerable time to come in the shipping difficulties which will have to be faced and overcome even after the war is over.—*The Engineer*.

The R.F.C.: Women Wanted.—The Women's Army Auxiliary Corps is calling for large numbers of women to work in aircraft repairing depôts, both at home and in France. There are wanted immediately by the Royal Flying Corps 144 fitters (general machine and turners), 52 instrument repairers, 20 acetylene welders, 37 electricians, 12 draughtswomen, 2 tracers, 145 storekeepers for technical stores (knowledge of engine parts and tools), also tinsmiths and coppersmiths. All applications should be made to the Exchanges, where full information will be supplied.

"For Those in Peril on the Sea."—The "Daily Telegraph" is making a Special Appeal on behalf of King George's Fund for Sailors, to which reference was made in our pages a few weeks ago. What we owe to those who go down to the sea in ships in these perilous times, and to the dependents of those who, in the course of duty with the Royal Navy, the Mercantile Marine, and the Auxiliary Services, make the great sacrifice or are maimed—who can count the sum of it? It is by these that we are allowed to have our daily bread, are able to support our forces in the different battlefields, and are protected in our Island Home from invasion. Words cannot express our admiration and our feelings of deepest gratitude, nor can subscriptions to a fund discharge our obligations. Admiration and gratitude our sailors have from all, and right well they know it. Let our readers see to it that through the medium of King George's Fund for Sailors their generosity takes a practical form in the shape of subscriptions sent to the *Daily Telegraph* Office, Fleet Street, E.C.4. The death roll of the sea in the war has been large indeed. In addition to the losses of men with the Fleet, over 6,000 sailors of the Merchant Navy have paid the great price on our behalf, and the call now is for at least a million pounds more to be subscribed to the fund on behalf of those whose bread-winners have passed within the veil. The stringency of the times must not be permitted to stand in the way of the realisation of that total.

Exemption Applications.—Peterborough Tribunal has granted three months' exemption to A. V. Yeomans (24, C3), car cleaner, employed by the Electric Traction Co.

At Morecambe, H. B. Atkinson, electrical engineer, appealed for exemption. It was stated that he had gone into a factory, but he had secured a man to do his electrical work at home. The Mayor remarked that Atkinson was given exemption as he was the only electrical engineer in the town to do certain necessary work, and now he had left it for something else. It looked as though he was playing with the Tribunal. The application was refused.

At Fleetwood, an electrical fitter, one of two C1 men, was given temporary exemption to the end of the year, his employer stating that he had a great many breakdown jobs in hand.

At Ormskirk, the Ormskirk Electric Supply Co. appealed for C. Chester and W. A. Hodson, both single and aged 18, the former B2 and the latter C1, who are employed as electrical engineers and fitters. It was claimed that they were in certified occupations, but the Military Representative questioned whether apprentices could be described as skilled men. For the company, it was stated that at the present time they had two engines broken down, and were "in a terrible mess," and that they had offered £3 a week for men to take their places, but had received no applications. Sixteen men had gone, and if these were taken the works would have to close down. Exemption to the end of the year was granted, the youths to join the V.T.C., the company to make further efforts to obtain substitutes.

The Military Representative appealed against the conditional exemption granted at Burnley to five motormen in the Corporation tramway department. Two of them were given final exemption for six weeks, and the others temporary exemption to the end of the year, open.

Malmesbury Rural Tribunal has given exemption until January 15th to C. A. Harvey (32, C3), electrician on the Earl of Suffolk's estate.

Four months' exemption, with leave to apply again, has been granted to E. W. C. Clayton (C3), electrician at the New Cross Empire.

At Bath, reviews were made of the cases of two drivers with the Bath Electric Tramways Co., Ltd., G. Dicks (40, Class A) and G. Humphries (35, Class A), both of whom held conditional exemption. The Military stated that "substitutes had been found, and the certificates were withdrawn."

Messrs. Edwards & Armstrong, electrical engineers, of Cainscross, appealed at Stroud (Glos.) for F. Marston (30, C1), engineer in charge of the firm's electrical works at Ludlow; J. T. White (28, C1), in charge of the electrical works at Tewkesbury; J. F. Cuddington, R. G. Young, and E. Preese, apprentices; and R. J. Sweeting (31, B3), electrician engaged in the repair of motors. Captain Wood said that the company had done extremely well in supplying men to the Army, and having regard to the fact that they were suffering from shortage of labour, he assented to temporary conditional exemption to March 31st, and this was agreed to.

At Stroud (Glos.), Messrs. T. B. Worth & Co., Ltd., Thripp, appealed for W. Rogers, electrician, passed for general service, and exemption until January 31st was granted.

At Hove, the Military appealed against exemption held by the accountant and chief clerk at the electricity works. He was previously classified B1, but had been put down to C1.

Sir Walter Miéville agreed with a suggestion that the man was doing more useful work in his present capacity than if he was to go into the Army. On Major-General Mason intimating that he would be put into a clerical department in the Army, the Mayor observed: "Why not let him remain, if that be so?" The appeal was refused.

At Broadstairs there was a Military review of the case of a storekeeper (31, Class A) with the Isle of Thanet Electric Tramways & Lighting Co., Ltd. He was granted conditional exemption until an efficient substitute is found, and the Military Representative contended that he was not a skilled man, and therefore not in a certified occupation. The manager of the company, Mr. J. A. Forde, urged that the man was a skilled workman, and in a certified occupation irrespective of age. The Tribunal held that the man was in a certified occupation and indispensable to the company, and they confirmed the certificate of exemption.

Appeals were made at Dewsbury for the principal of a local firm of electrical engineers, aged 23, and for two employés, one an electrical fitter (23) and the other the foreman engineer and turner (31). The firm was stated to be engaged upon very important work, including a contract in connection with a military hospital. The principal was granted exemption, the fitter was directed to join up in two months, and the other man in one month.

At Brighton, a local firm appealed for an electrician and fitter (30, C3), it being stated that the man was doing important work in electrically fitting up local military hospitals. Sir John Blaker (for the Military) urged that the man would be of even more use in the Army, where electrical fitters were badly needed. He would probably be very useful abroad for the Army, not, of course, in the fighting line, but on electrical work. Mr. A. F. Gasston (a member of the Tribunal) said that he believed that C3 men who had been sent into the Army were being turned out of it now, and Sir John Blaker replied that they must be men with no trade. Mrs. Ashton expressed surprise that C3 men would be sent abroad. Sir John Blaker: Not into the firing line, and it does not follow that he would go abroad. He could be used on electrical work at home, and if you visit military camps in this country you will be astonished at the big electrical plant they have for different purposes, including the generating of their own electric light. The appeal was allowed.

At Mansfield, there was a Military review of the cases of J. Tranter (29, Class A), inspector, and G. W. Marshall (35, Class A), driver, engaged with the Tramway Co., given conditional exemption in May, 1916. The Military Representative said that the review was made on account of the classification of the men, and Mr. Walker, manager of the company, stated that Tranter was formerly an inspector, but, being a skilled electrician, he was now doing much more important work in looking after the overhead cables. He was prepared to let Marshall go, as they could find a woman to take his place. Tranter's exemption was continued, but that of Marshall was cancelled.

BUSINESS NOTES.

Trade with Brazil: A Consul's Counsel.—The Acting British Consul at Bahia, who has recently visited a number of towns in Brazil has reported giving information respecting commercial conditions which is published in the *Board of Trade Journal* for September 27th. Among the points touched upon are: commercial travellers, openings for trade, and packing. In regard to the first, he finds that at Aracaju, German travellers, even at the present time, are numerous. Complaint is made that, as a rule, British travellers are not accommodating as regards the particular requirements of prospective customers, and the Consul is convinced that in many cases a little tactfulness and resource on the part of travellers would promote trade. One firm stated that prior to the war it received constant visits from German travellers, that it was buying every year more from Germany, and less from the United Kingdom, and that it is also buying largely from the United States at present. There is a great field for the initiation of business through the agency of travellers in Aracaju, but it is useless to send men who do not speak the language and who cannot, at any rate partially, understand the Brazilian character. With regard to the ironmongery stocked at Aracaju, much of this of British manufacture is superior to any others, but the cheap German goods are preferred, as buyers cannot afford to pay our high prices. He does not advocate that British manufacturers should imitate the inferior goods supplied by German firms, but, after comparing the goods, he states that British manufacturers could probably turn out very serviceable articles at but slightly higher cost than the cheap German goods, and that once British goods were introduced they would hold the market. Articles to last a life-time are not required, but cheap goods which can be readily replaced. With regard to the packing of German goods, the usual thoroughness is shown in ticketing. Tickets on German goods are the same as are used for sales in Germany, but printed in Portuguese, thus saving shopkeepers a great deal of trouble. British goods are ticketed in English, and the shopkeepers have to make Portuguese translations and gum them on. This extra trouble does not facilitate sales any more than conducting correspondence in Spanish. The language to use is Portuguese. In looking through the correspondence of one firm, however, he

was gratified to find how much of it from British houses was written in excellent Portuguese, though some was written in English, a matter which always creates difficulty, as English is not usually understood.

"Supertax" on British Trade with Australia.—The *Australian Statesman and Mining Standard* characteristically takes up the cudgels on behalf of British export trade against the Australian Customs Authorities, who are adding 10 per cent. to the amount stated in invoices on certain classes of machinery. We quote from our contemporary's leading article, entitled "Super-taxed British Trade," below:—

"Under a clause in the Tariff Act, originally designed to operate in pre-war conditions of trade, the duties on various engineering and other imports are based on the fair selling value in the country of origin at the time of shipment. In the present disorganised state of the markets in Great Britain, it is probably often difficult to arrive at a close approximation of 'fair selling value.' This consideration does not, however, appear to trouble the Australian Customs Authorities much. They have come to the conclusion that in many instances of late the declared value is understated, and they have accordingly adopted an arbitrary practice of adding 10 per cent. to the amount stated in the invoices on certain classes of machinery. No doubt they have a technical right to do this; but in instances where they show a rigid insistence upon their own judgment and powers, their action conveys, to reputable English firms, an appearance of harshness, and even of sharp practice. The 'loading' of invoices to the extent mentioned presses with considerable severity, and possibly serious injustice, in the case of important electrical contracts which were undertaken before the beginning of the war, and thus before the firms concerned could protect themselves by special arrangements to meet losses through delays, increased costs of production, and other causes. Apart, however, from the question of justice involved in this new rule of the Customs Department, what are we to think of it as an indication of policy—of a policy which not only tends (owing to the conditions of production in England at the present time) to favour foreign manufacturers, but is inconsistent with, if it does not actually stultify, the unqualified assurances given at intervals by our leading political representatives that the Commonwealth would do the utmost in its power to aid Great Britain during the war? Those assurances undoubtedly imply an obligation to assist the export trade of Great Britain, or at least to avoid discouraging and injuring it. By helping to maintain it we can do a service of real, if indirect, importance in the war. . . . To inflict, under an obsolete law, practically penal surcharges on British firms at the Commonwealth Customs Offices, while Australia is handling tens of millions of British money, is worse than ridiculous; it is stupid and humiliating. If the personnel of the Customs Department cannot bring themselves to interpret their discretionary authority in a more rational spirit, the matter should receive prompt attention from the Government or the Federal Parliament."

Spain.—There has been formed, at Barcelona, an industrial supplies company styled Sociedad Anonima Abastos Industriales, with a capital of 100,000 pesetas. The company will trade in industrial and agricultural machinery, motors, dynamos and accessory electrical material, manufacture complementary parts, import and export primary materials, and manufactures. The promoters are Messrs. Marimon & Jorda.—*La Energia Electrica*.

Scarcity of Lamps in S. Africa.—The *British and South African Export Gazette* says that electric lamps are so scarce in South Africa that those supplies presumed to be on the water are being disposed of on "to arrive" terms.

Our Commercial Intelligence Service.—At the last meeting of the Advisory Committee to the Board of Trade on Commercial Intelligence, the President of the Board of Trade and Sir A. H. Steel-Maitland made statements as to the reconstitution on an extended scale of the Department of Commercial Intelligence under the arrangements recently concluded between the Board of Trade and the Foreign Office. The Committee also considered questions relating to the promotion of British trade and shipping interests in Latin America, and a report of a special inquiry into the electrical trade in Spain and Portugal. A report to the Board of Trade on the work of the Committee since its appointment in 1913 was adopted; and this being the final meeting, the President expressed to the members his appreciation of the valuable assistance given by them to the Board of Trade during their period of office.—*Daily Telegraph*.

Italy.—Under the style of the Società per lo Sviluppo della Cianamide e di altri Prodotti Chimici, there has been formed at Rome, with commercial and administrative quarters at Turin, a company for the production of cyanamide and other chemical products. The company has interests in the most important foreign cyanamide concerns, and proposes greatly to develop this industry, as well as the chemical industry generally. An influential management committee has been nominated.—*Revista Tecnica d'Elettricità*.

Lighting Large Areas.—That the arc lamp is by no means out of the running is shown by a leaflet which Messrs. JOHNSON & PHILLIPS, LTD., recently issued, giving the comparative running costs of a 2,000-C.P. unit per year of 4,000 lighting hours, with an arc lamp and with half-watt lamps respectively. The 8-ampere "Metroflam" flame arc cost £11 9s. 8d. inclusive and the half-watt lamps (two of 1,000 C.P. each), with renewals, £28 0s. 10d., energy being reckoned at 1d. per unit. The flame arc, in fact, is unexcelled for the economical lighting of large shops and yards where powerful units are required.

Book Notices.—A small journal, called the *Smic Record*, has been issued by Messrs. Watson & Sons (Electromedical), Ltd., of 196, Great Portland Street, W. 1, dealing with the progress of the X-ray industry, which has been extraordinarily rapid during the war, owing to the universal use of X-ray apparatus at the military hospitals. The first issue contains short articles on X-ray plates, a new exposure meter, dental radiography, &c., and future issues will be supplied regularly to any reader who applies to the firm for them.

"Theory and Calculations of Electrical Apparatus." By C. P. Steinmetz. London: Hill Publishing Co. Price 17s. net.

"Minutes of Proceedings of the Engineering Association of New South Wales." Vol. XXXI. Sydney: The Association.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXVI, No. 9. September, 1917. New York: The Institute. Price \$1.

"Heat Drop Tables." Calculated by H. Moss from the formulae and steam tables of Prof. H. L. Callendar, F.R.S. Published for the Turbine Section of the B.E.A.M.A. London: Edward Arnold. Price 5s. net.

Liquidations.—**WORTHINGTON PUMP CO., LTD.**—This company is winding up voluntarily, with Mr. F. M. Whiting, Queen's House, Kingsway, London, as liquidator. The liquidation is for the purpose of amalgamation with a company with which the Worthington Pump Co. have been associated for many years. The business of the two companies will be carried on as hitherto at the same address, and creditors will be paid in full.

BRITISH CONTINENTAL ELECTRICITY CO., LTD.—A meeting of creditors is called for October 19th, at 21, Finsbury Pavement, E.C. Liquidator, Mr. C. E. Barker.

Trade Announcement.—The Jandus Arc Lamp and Electric Co., Ltd., has changed its name to ARC AND GENERAL EQUIPMENT, LTD. The alteration has been made because difficulty has arisen from time to time with reference to the name "Jandus," regarding which there was a suspicion that the company was of German origin. We understand that William Jandus was a native of Ohio, U.S.A., and that he no longer holds any interest in the company.

Trade with Switzerland.—Mr. J. B. Beak, the Acting British Consul-General at Zurich, who is visiting this country, will be prepared to interview by appointment representatives of British firms at the offices of the Department of Commercial Intelligence, commencing on Monday, October 22nd. British firms who may desire to have an interview with Mr. Beak are requested to make their applications as soon as possible, and in any case not later than Thursday, October 18th, to the Comptroller-General, Department of Commercial Intelligence, 73, Basinghall Street, London, E.C. 2. Reference number, 46,273/17.

Catalogues.—**MESSRS. MELDRUMS, LTD.,** Timperley, near Manchester. Two illustrated lists, one (No. 86) giving particulars and pictures of typical refuse-destructor installations for power production; the other (89) dealing with apparatus for chemical and explosives and other works.

A. Gallenkamp & Co., Ltd.—The Public Trustee is inviting tenders for 1,650 preference and 1,341 ordinary shares in this company of laboratory fitters and makers of scientific apparatus, under the Trading with the Enemy Acts.

LIGHTING AND POWER NOTES.

Basingstoke.—**PRICE INCREASE.**—The T.C. has decided to increase the charges for current by 15 per cent. as from September 29th.

Bradford.—The Corporation Electricity Committee has decided to apply to the B. of T. for power to disconnect classes of non-essential consumers in cases of urgent necessity, as suggested by the Coal Controller.

Braintree.—**PROV. ORDER.**—The U.D.C. has decided to apply for a prov. order for electric supply, and to oppose, solely to protect the interests of the town, any similar application by the Crittall Manufacturing Co., Ltd.

Coal Economy.—It is reported from Oldham that certain Corporation departments are short of coal, the stock being 10,000 tons under the normal amount, and the Coal Controller is to be interviewed. The question of coal consumption at the Middleton electricity works has been investigated by Mr. Robertson (for the Coal Control Department), and he is in agreement with the proposal to convert the station into a transforming and distributing centre, utilising a bulk supply from Manchester. At Wigan T.C. attention was drawn to the necessity of persuading small power users to convert to electrical driving in the interests of fuel economy.

Continental.—**SPAIN.**—Application has been made for a concession to establish a hydro-electric station on the River Hormazuela, in the Isar district, with a view to supplying Isar and Villa Nueva de Argano with electric light.—*La Energia Eléctrica.*

Consequent upon the result of trials carried out at the Maria Luisa colliery, at Langreo, underground electric traction has been introduced into the majority of the groups of the Sociedad Metallurgica Duro-Felguera. Twelve 26-H.P. locomotives have been installed, continuous current at 220 volts being employed.

Darlington.—Domestic consumers desiring to use electricity for heating, &c., are to be charged 4d. per unit up to the amount consumed for lighting in previous quarters, and 1½d. per unit for excess consumption, the amount to be paid by a consumer to be not less for any six months ending June or December than the amount fixed for lighting, plus 20s. for heating or cooking. This rate overcomes the present difficulty of installing two meters on a consumer's premises.

Derby.—The T.C. has contracted for the repair of the armature of a turbine set which has broken down after ten years' continual heavy work—at a cost of £725. The new plant which the Council contracted for in January has not yet been received, and an appeal has been made to the public to economise in the use of electricity over peak load periods. An extensive new works which it had been hoped to supply, intends to provide its own electricity, the Government finding the funds, and thus directly negating the policy of concentrating electric power production which it is supposed to be strongly supporting.

Halifax.—**WAGES.**—The Corporation employees, on Sunday night last, decided that their demand for increased wages, rejected by the T.C., be submitted to arbitration. They ask for a further 6s. per week, to bring their war bonus up to 15s. per week above pre-war wages. In August they asked for 12s. above pre-war rates, and the Committee on Production granted 9s., which was a 1s. higher than the Corporation had previously given. The men now hold that since then employees of other Corporations have obtained better awards.

NEW POWER STATION.—Sir John Snell has confirmed the advisability of purchasing the site at Copley for a possible new power station. Though such a station may not be required before 1920, it will be necessary to commence it almost immediately, and the present station in the town is not suited to extension.

Ipswich.—**YEAR'S WORKING.**—The annual report of Mr. Ayton, the manager, on the working of the Corporation electricity undertaking during the year ended March 31st last, shows that the units sold advanced from 3,734,158 in 1916 to 4,836,171 in the year under review, the increase being principally in power units, while public lighting supply decreased. The revenue totalled £39,575, while working expenses were £26,825, and, after meeting interest and sinking fund charges, and £370 war service allowances, there was a deficit on the year's working of £172, although the total revenue shows an increase of £5,606 on the previous year. Coal has cost £2,900 more, wages £540, and repairs were £500 higher than in the previous year; taking the whole of the working expenses, they are £5,470 more, or 30 per cent. increase. Mr. Ayton states that great benefit has been experienced from the new coal-handling plant which was put into operation in September last year, and again draws attention to the ash and clinker content, which has reached as high a figure as 30 per cent., while, generally, it has averaged a figure in the neighbourhood of 20 per cent., or nearly double what the same coal gave in pre-war days. He also points out that a lowering of the boiler-house costs would follow the fitting of mechanical stokers to the five marine-type dryback boilers, and considers that this work, as well as the installation of additional plant, must be undertaken as soon as normal conditions return.

Kingston-on-Thames.—The T.C. has appealed to consumers to use less electricity, owing to the demand for energy for power purposes, otherwise it will at times be necessary to cut off the supply from some portions of the borough.

Kirkburton.—**PROV. ORDER.**—The U.D.C. has given consent to the Huddersfield Corporation for a prov. order to supply electricity in the district.

Leeds.—**POLICE INDICATING LAMPS.**—The police authorities are about to commence the use, by special constables on point duty at night, of indicating lights. The equipment consists of a white light on the left hand, a red light on the right, and a red lamp on the constable's back; thus he is protected from accident in the rear, and can hold up or wave forward traffic with the hands. The lamps are supplied by a 10-volt accumulator strapped to the back by shoulder-straps and the belt, and the total weight is less than 5 lb.

Lewes.—**STREET LIGHTING.**—The T.C. has accepted the offer of the electricity company to provide 30 temporary lamps in the town at a cost of £74, and to light them for £10 a year; the use of gas would cost £30 more.

Liverpool.—The proposal to increase the salaries of Corporation officials has led to a considerable amount of feeling. Strong opposition was expressed, but an amendment that no advance be given to officials in receipt of salaries of £500 a year or more was defeated in Council by a large majority. The Municipal Employees' Association, at a mass meeting, passed resolutions protesting against "exorbitant increases of salary to already overpaid officials, while ordinary employees are practically ignored," and demanded an increase of 8s. per week on the war bonus (12s.) to include all employees over 18 years of age, the present bonus with the increase to be converted into wages.

London.—**STEPNEY.**—The Electricity Committee recommends that all charges made in respect of electricity supplied to consumers, including meter rentals (except special contracts) be increased by an additional 16½ per cent., making a total increase on pre-war rates of 50 per cent., to commence with and include the accounts rendered for the month of October, 1917. An

arrangement has been come to by which the Council will co-operate with the Bethnal Green E.C. in respect to wiring and supply of apparatus for consumers.

HAMPSTEAD.—The annual report of Mr. Wyld, the borough electrical engineer, shows that the total sales of energy, 5,202,454 units, though an increase on the previous year, were below pre-war figures. The net income, £76,628, was £9,109 up; the total expenditure, £78,728, showed an increase of £4,500, and a deficit of £2,100 resulted, as compared with a deficit of £6,710 in the previous year. The reduced deficit is due to increased charges in force. During the year a new 1,500-kw. turbo-alternator was burnt out, the makers accepting responsibility; new B.T.H. switchgear has been erected on the site of the Ferranti board while in commission, by the department's staff, and a new cooling tower has been added.

Marsden.—E.L. PROPOSAL.—At a special meeting of the U.D.C., held for the purpose of considering the advisability of applying for a prov. order, Mr. Ernest Schofield advised the Council not to apply for an order at the present time, and the Council decided to ask the Yorkshire Electric Power Co. how soon it would undertake to supply electricity to the district after the war.

Newcastle-under-Lyme.—LINKING-UP.—The Council has decided that the electrical engineer, in conjunction with the engineer of the Stoke-on-Trent undertaking, shall prepare a scheme for linking-up the two undertakings. A general conclusion in favour of this course was arrived at sometime since at an informal meeting between representatives of the two Corporations.

Oldham.—The restricted output of local cotton mills under the Control Board scheme is believed to be responsible for a decrease in the number of units supplied recently by the Electricity Committee, as compared with last year. The production cost per unit had risen from 0.462d. to 0.516d.

VEHICLE CHARGING.—The Corporation Electricity Department is now prepared with the necessary apparatus for charging electrical vehicle batteries. It is expected that this form of traction will become increasingly popular in Lancashire towns.

Peterborough.—Messrs. Barford & Perkins have voluntarily agreed to pay the T.C. a further increase of 10 per cent. in the price of current supplied to them under contract.

Sheffield.—According to the local papers, the city's electrical undertaking sold during the year ended March last, 48,600,000 units more than in the previous year, an increase of 62 per cent. The revenue increased from £277,580 to £450,088. The total connections increased by 30,000 kw. to 113,870 kw., and applications awaiting connection totalled 21,350 kw. The installation and motor department had a turnover of £55,473, an increase of 50 per cent., and installed over 8,000 H.P. of motors during the year. The electricity department now employs 106 females.

The renewal of the equipment in No. 1 sub-station at the Neepsend power house, at an estimated cost of £2,000, is to be proceeded with.

Stafford.—Land has been purchased by the T.C., at a cost of £1,125, for the extension of the electricity works.

Stoke-on-Trent.—LINKING-UP.—A preliminary discussion between representatives of the T.C. and Leek U.D.C. is to be held regarding the question of linking-up the electricity undertakings, as well as that of the Newcastle-under-Lyme Council.

Sunderland.—YEAR'S WORKING.—The annual report of the Corporation electricity undertaking shows that the total revenue for the year was £78,290, and the expenditure £48,821, leaving a gross profit of £29,469, to which there was added a contribution of £2,026 from district fund towards the sinking funds. The net revenue was applied as follows:—Payment of interest and income-tax, £12,911; repayment of loans, £17,421; contributions to capital, &c., £287; renewals, £870. The net revenue for 1915-16 was £30,636. The capital expenditure to March 31st, 1917, was £494,069, and the loan debt, including a debt of £8,305 remaining on superseded plant, was £263,356.

Swansea.—EXTENSIONS.—The borough electrical engineer has drawn attention to the necessity of extending the plant at the electricity station on account of increased load. Although he did not suggest that the whole scheme should be proceeded with at the present time, yet he thought the question of installing a new turbine of 3,000 kw. or 5,000 kw., with all auxiliaries, should have immediate attention. It was decided to have a report on the subject.

The Electricity Committee has received a report from the borough electrical engineer of a meeting of the Western District Joint Committee on Linking-up. Discussion ensued at the meeting over questions as to the best way of dealing with the intervening mains between adjacent supply authorities (which in this particular case would come specifically under the powers of the South Wales Power Co.), and Mr. Chamen observed that a power company might erect and maintain on such terms as either a rental paid or transmission charges. Mr. Burr said the links would cost the Swansea Corporation some £15,000. The proposed routes of the mains between Swansea and Llanelly and Swansea and Neath were also discussed at the meeting, and Mr. A. H. Thomson (engineer, Neath) estimated that the cost of the Neath link, so far as his Council was concerned, would be some £10,000. The matters were adjourned for further consideration, Mr. Chamen stating that he would be very pleased to commence

negotiations at once with the parties concerned. Mr. Burr's report was adopted.

The Electric Lighting Committee has approved of a recommendation of the Borough Technical College Sub-Committee that Mr. J. W. Burr, the borough electrical engineer, undertake, as a temporary measure, the teaching of the advanced class in electrical engineering at the Technical College.

Walsall.—The Electricity Committee has decided to reconsider the matter of electricity charges three months hence. A Committee on Production award involves the department in an additional wage expenditure of £400 a year.

The erection of the second turbo-alternator is completed, but, owing to trouble with a circulating pump, the alternator is not yet in commission. The Committee has approved a schedule of plant at the Wolverhampton Street generating station about to be advertised for sale.

Wednesbury.—ANNUAL ACCOUNTS.—The report of the year's working of the electricity undertaking shows receipts amounting £12,386, as compared with £10,860; working costs to £11,030, as compared with £8,331, leaving a gross profit of £1,356, as against £2,529 in the previous year. Loan and other charges totalled £3,818, leaving a deficit on the year's working of £2,462, which, with £1,681 debit balance brought forward, makes the total deficiency £4,143. The reduction of public lighting, and the increased costs of fuel and Mond gas, are the principal causes of the unsatisfactory result.

Wharfedale.—The Burley Council, in considering the Yorkshire Power Co.'s application for a prov. order, has asked the company to agree to various conditions, including a purchase clause: the Menston Council favours electric lighting.

Wolverhampton.—PRICE INCREASE.—The Electricity Committee has decided that, in addition to the 20 per cent. increase in the charges for electricity already sanctioned by the Council, a further 10 per cent. advance be made in the charges to consumers of electricity for power purposes who are paying the pre-war price of 1d. per unit and under (plus the 20 per cent. increase), such further increase to date as from October 30th.

Worcester.—PRICE INCREASE.—The City Council has decided to add a further 10 per cent. to its lighting, heating and power charges, making 20 per cent. on pre-war rates. The 10 per cent. increase will produce £16,000 towards a deficiency of £24,000.

The City Council has granted increased salaries to its assistant electrical engineers and a war bonus to each member of the staff; it has also revised the wages list, and the increases are estimated to cost £600 per annum.

TRAMWAY AND RAILWAY NOTES.

Accrington.—Mr. H. Pilling, Corporation tramway manager, in discussing the award just made by the Committee of Production to Lancashire tramway workers, states that previous to the latest grant the war bonuses paid to the local tramway workers exceeded £3,000 per annum, and the last award will mean an additional £900 a year. This is equivalent to a rate of 4d. or 5d. in the £. Some of the Accrington workers, who number 115, will receive as much as 14s. or 15s. per week for overtime. As an alternative to this advance in wages, the question of the increase in fares will have to be seriously considered. Before the outbreak of the war the cost of tramway tires, &c., was much less than now; material for which £1,000 was paid prior to the war is costing £3,000.

Bootle.—TRAMWAYS AGREEMENT.—A lengthy discussion took place at the T.C. on the new tramway agreement with Liverpool. Alderman Booth, explaining the reason for the agreement, said that before the war it was decided that the entire system needed reconstruction, but the war held up the matter. Liverpool claimed over £30,000 for loss of traffic, damage to cars, &c., to the end of 1916, and, after deciding to go to arbitration, it was arranged to settle the matter between the two Corporations. The new lease would run for 25 years from July 1st last, at a rental of £500 a year for the first six years and £1,000 a year after, Liverpool taking over the debt of £20,000, less the reserve fund of £700. In case of future extensions, Liverpool had agreed to pay £200 a mile. Liverpool would pay £13 per mile yearly for the upkeep of the overhead equipment. Councillor King said Bootle were selling their birthright to Liverpool, and they would be sorry for it, and Councillor Randall considered that they had been bluffed into the agreement. The Council, however, sealed the new agreement.

Continental.—SPAIN.—Application has been made for a concession to establish an electric tramway in Guadalajara, running from the railway station to the Plaza Mayor of the city.

The success which has attended the public subscription of capital, brings the realisation of the Oviedo electric tramways scheme into measurable distance. The work will be divided into six sections of 17 km. Later some 12 branches will be constructed to distant localities, thus completing the Asturias tramway network.

The concession granted to Pedro Garcia Faria, on June 3rd, 1892, for the construction of an underground electric railway in Madrid is declared to have lapsed, but an appeal may be lodged. The

above concession should not be confounded with that of the Central-Metropolitano, granted in September, 1916; the latter is a modest scheme of only 4 km. extent, out of an eventual aggregate of 14 km.

Doncaster.—CHEAP FARES. —At the T.C. meeting, last week, an attempt was made to upset the decision of the Council-in-Committee to support the Tramways Committee's recommendation for the withdrawal of all workmen's and other cheap return tickets, owing to the present high cost of working. Councillor Warren, who moved that the minutes be not confirmed, admitted that on September 17th he had himself voted in favour of the abolition of the tickets, but he now thought there was another way out. He said last summer, on considering the tramway estimates for the present year, the price put down for current was 1½d. per unit plus, 10 per cent. war charge, and that worked out at 4s. 7d. per 40 units. In May this year a sliding scale for large consumers had been brought forward, based on seven-tenths of a penny per unit, whilst the coal was 10s. per ton. Provision had also been made for a fluctuation of coal on the basis of 55ths of a penny for every 6d. increase per ton in the price of coal. Based on to-day's price, he worked that out to be 3s. 1d. for 40 units. He suggested that this margin was more than enough to make up the deficiency with which the tramways would be faced on account of increased expenditure, without taking such a drastic step as withdrawing the tickets. Councillor Marshall ably defended the Tramways Committee's reasons for urging the withdrawal, and the meeting decided, by 20 votes to 8, on the final adoption of the recommendation.

Ipswich.—YEAR'S WORKING. —The annual report of the Corporation's tramway undertaking shows a total revenue amounting to £25,566; working expenses amounted to £21,922 and war service allowances to £587, and, after meeting interest and loan repayments, there was a deficit on the year of £2,671, as compared with a profit of £2,757 in the previous year. The loss has been taken from the surplus brought forward of £3,700, leaving a credit balance of £1,028 to be carried forward. The passengers carried numbered 6,246,820 and the car-miles were 567,503, which compare with 6,798,589 passengers and 620,115 car-miles in 1916. The reserve or renewals fund now stands at £24,053.

London.—L.C.C. —The reduction in ticket transfer facilities, referred to in our last issue, is stated to have greatly increased the congestion at certain points on the tramway system, involving delay and overcrowding. According to the *Times*, it is being urged that the cost of reducing the loss by fraud under the old arrangement will exceed the possible saving.

Now that fares have been increased on the Council's tramways, the Stepney B.C. is inserting the tramways in a provisional valuation list with a view to increasing the rateable value.

Lytham.—The Council has decided to inform St. Anne's Council that it has been advised that the consent of the B. of T. to the supply of electrical energy to the Tramways Co. in the Urban District of Lytham should be applied for by St. Anne's, with the consent of Lytham Council, such consent to be effective only during the existence of the agreement between the two Councils.

Manchester.—INCREASED EXPENDITURE. —Some interesting figures were given at the City Council last week: Alderman Bowes, chairman of the Tramways Committee, said the recent award of the Committee on Production to the employes in that department would mean an increased cost of £78,780, which, with the war advance, amounted to £90,000. The award given on September 27th to the tramway and vehicle workers would cost £27,040, and, with the award given to the Workers' Union on the same date, the total was brought up to £119,086. The undertaking could not stand such a heavy burden without doing something to increase the fares, and the Tramways Committee would take the matter into consideration at the earliest opportunity. However much they disliked higher fares, they had reached a point at which it was absolutely impossible to go on paying their way on the present fares. It is not expected, however, that the increases will be of a very drastic character, a return to the scale obtaining before the stage extensions in 1913 being the scheme mostly favoured.

Mansfield.—The Mansfield and District Light Railway Co. has applied to the B. of T. for an extension of time until April 9th, 1921, for the completion of five lines of tramways in Sutton-in-Ashfield and Skegby.

Nelson.—SUGGESTED 'BUSES'. —The Corporation Tramways and Electricity Committee has had under consideration the provision of passenger-carrying vehicles, to be run in the higher portions of the town in conjunction with the existing light railways. The Sub-Committee inspected the electric omnibuses at Lancaster, but it was decided to defer the matter for the time being, the view being that the type of vehicle was unsuitable for gradients, and that there was prospect of an improvement after the war.

Newcastle-on-Tyne.—ASSESSMENT. —At the Quarter Sessions, on October 6th, Mr. Maynell, representing the Corporation, asked for a consent order regarding the tramway assessment for 1915, 1916, and 1917, and this was granted. The total figures had been agreed between the parties, and the order would reduce the assessment in accordance with the figures. The matter was referred to in our last issue.

New Zealand.—ELECTRIC VEHICLES. —Mr. W. E. Stark, the Christchurch city electrical engineer, recently declared himself convinced of the future of the electric vehicle, predicting that within five years' time after the war Christchurch will have a fleet of 500 cars. At present there are nine representative "electricies" in use in the city, which have given every satisfaction.

Sunderland.—YEAR'S WORKING. —The report of the year's working of the Corporation electric tramways undertaking shows that the total revenue was £85,513, and the expenditure on traffic, power and management expenses £49,970, leaving a gross profit of £35,543, as compared with £34,669 in 1915-16. The gross profit was applied as follows: —Interest and income-tax, £10,650; repayment of loans, £13,368; contributions to capital, &c., £127; borough fund in aid of rate, £5,000; and the balance of £6,098 was transferred to the renewals fund. The capital expenditure to March 31st, 1917, was £307,120, and the loan debt £115,311; the amount to the credit of renewals and reserve funds was £56,711.

Swansea.—NEW LEASE. —The Committee has agreed to proposals in regard to a new tramway lease. The reason for the new lease is because of the peculiar state of the law governing the Swansea tramways and light railways. These are held under various leases, and as each lease expires it has to be renewed, with the result that it is not until 1980 that the Corporation is able to exercise its powers of purchase of the whole system. In 1911, however, negotiations were opened, and it was agreed to equate the varying periods, so that the Corporation can exercise its powers in about 20 years' time. An agreement was also come to by which there should be one lease only of the existing system, and certain new sections of tramways and light railways then under construction. It is in pursuance of that agreement that the new lease is about to be completed. The fixed rental comes to about £6,000 per annum.

Walsall.—The Tramways Committee has accepted an offer of the services of boy scouts to assist conductors during busy hours.

CONTRACTS OPEN AND CLOSED.

OPEN.

Dublin.—November 1st. G.N. Railway Co. (Ireland). Six or twelve months' supply of general stores (including several electrical items). See "Official Notices" October 5th.

Grimsby.—October 29th. Corporation. House service boxes and house fuse-boxes and fittings. See "Official Notices" to-day.

London.—OFFICE OF WORKS. —October 12th. Steam tubes and fittings for twelve or six months. Secretary, H.M. Office of Works, Storey's Gate, S.W. 1.

Morecambe.—October 15th. Electric Traction Committee. Supply of electrically-driven omnibus. See "Official Notices" October 5th.

CLOSED.

Bradford.—Having received a report as to difficulty in obtaining delivery of pinion wheels from the present contractor, the Tramways Committee has decided, without interfering with the existing contract, to accept the offer of the British Hele-Shaw Patent Clutch Co., Ltd., for 162 steel pinions, at £212.

Derby.—T.C. Repairs to turbine armature: Parsons, Ltd., £725.

London.—MARYLEBONE. —Electricity Committee. Grab for the electricity works travelling crane, £500; Goodaeres and Sons, Ltd.

STEPNEY.—The Electricity Committee has accepted the following offers for coal:—

Bradbury, Son & Co.—5,000 tons Clifton peas, &c., at 24s. 6d. per ton.
Foster & Co.—5,200 tons Bolsover nutty slack, at 21s. 7d. per ton; 1,000 tons Arley D.S. nuts, at 25s. 4d. per ton; 600 tons Stribston slack, at 21s. 8d. per ton; and up to 100 tons per week of Coombs Wood beans, at 22s. 10d. per ton.

Sheffield.—City Council:—

Ferguson, Pailin & Co., Ltd.—One 500-amp., 2,000-v. switch panel.
W. T. Glover & Co., Ltd.—Cable (revised price schedule).

Stafford.—Gas and Electricity Committee. J. Dallow and Sons, Blackheath, at £1,987, new boiler-house and pump-room for the electricity department.

Stretford.—U.D.C. Accepted tenders:—

Underwood (Manchester), Ltd.—One 25-h.p., 500-volt D.C., shunt-wound, totally-enclosed motor, £175.
James Hodgkinson (Salford), Ltd.—One 66-in. diameter special induced-draught fan, £204.

Transformer Contracts.—The following orders for transformers have been received by Messrs. Ferranti, Ltd.:

Glasgow Corporation.—Sixteen 1,875-k.v.a. single-phase transformers.
Birmingham Corporation.—Seven 1,250-k.v.a. single-phase transformers.
Barrow-in-Furness Corporation.—One 400-k.v.a. three-phase transformer.
Manchester Corporation.—One 125-k.v.a. three-phase transformer.
British Thomson-Houston Co., for Shoreditch Borough Council.—One 1,650-k.v.a. three-phase transformer for use with a rotary converter.

Wolverhampton.—Corporation. Accepted tenders:—

Strachan & Henshaw.—Coal-conveyor plant for the electricity works, £1,542.
Gibbons Bros.—Steel structure for additional coal-conveyor plant, £926.
Reynolds & Co.—One 5,000-kw. generator panel and two 2,000-kw. feeder panels, £1,950.
Stirling Boiler Co.—Boiler equipment complete with stokers, fans, chimney, &c., £19,822.
British Thomson-Houston Co.—5,000-kw. turbo-alternator, £17,803.
Allen & Co.—Condenser body, £6,083.
Willans & Robinson.—Condenser plant auxiliaries, £3,729.

FORTHCOMING EVENTS.

Electro-Harmonic Society.—Friday, October 12th. At 8 p.m. At the Holborn Restaurant (Venetian Chamber). First smoking concert of the season.

Junior Institution of Engineers.—Friday, October 12th. At 7.30 p.m. At 39, Victoria Street, S.W. 1. Paper on "Scale Prevention in Water-cooling Systems" (illustrated by experiments), by Mr. H. Sampson Wills.
Monday, October 15th. At 7.30 p.m. At 39, Victoria Street, S.W. 1. Paper on "Mechanical Arms," by Mr. E. W. Hobbs.

Birmingham and District Electric Club.—Saturday, October 13th. At 6.30 p.m. At the Swan Hotel, New Street. Ladies' night.

North of England Institute of Mining and Mechanical Engineers.—Saturday, October 13th. At 2 p.m. At the Wood Memorial Hall, Newcastle-on-Tyne. General meeting.

Institution of Mechanical Engineers.—Friday, October 19th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. "A Comparison of the Working Costs of the Principal Prime Movers," by Mr. Oswald Wans.

NOTES.

Organisation of Power Station Engineers.—The meeting of the Midland Electric Power Supply Engineers' Association, announced in our issue of September 28th, was held at Birmingham, on October 5th. Representatives were present from other large Midland towns, and the temporary Committee was strengthened by their inclusion. Detailed information can be obtained from the hon. secretary, Mr. P. J. Burgess, 21, Geraldine Road, South Yardley, Birmingham.

Association of Electrical Station Engineers.—On Friday last a meeting was held at St. Bride's Institute of central-station staff engineers, at which representatives of 16 central stations in the London area agreed to support the A.E.S.E.

A similar meeting was held in Manchester on October 3rd of the central-station staff engineers of Manchester and district. The following resolution was carried unanimously:—"That this meeting of staff engineers in the Manchester district being convinced that collective organisation is an urgent necessity, expresses its entire agreement with the objects of the A.E.S.E., and resolves to hold a further meeting to discuss the various details in connection with the Association as soon as possible." During the last few days a form has been extensively signed by London central-station staff engineers protesting against the Electrical Trades Union negotiating with regard to rates of pay, &c., for central-station staff engineers. The number of signatures received to date gives the A.E.S.E. a very strong position in the matter. Any engineers interested can obtain full particulars from the Hon. Secretary, A.E.S.E., 26, Little Park Gardens, Enfield.

London Power Station Employees.—The Stepney B.C. Electricity Committee has appointed two representatives to serve, together with the borough electrical engineer, on a body, the formation of which is recommended by the Associated Municipal Electrical Engineers to consider working conditions, rates of pay, &c., of employment in the power stations of London.

Marylebone Electricity Committee having considered a communication from the Chief Industrial Commissioner, Ministry of Labour, concerning war wage grants in municipal power stations in the metropolis, and the possibility of uniformity, has informed the Commissioner that it has from time to time, and as late as August last, been in negotiation, and has come to satisfactory arrangements, with employees of the Electricity Department, through a representative of the National Amalgamated Union of Engineemen, Firemen, Mechanics, Motormen and Electrical Workers, and that it sees no reason to re-open the question at the present time. The Committee entirely agrees with the suggestion as to establishing uniform payments and conditions for employees in London power stations.

Instruction in Technical Optics.—At the last meeting of the Governing Body of the Northampton Polytechnic Institute, Prof. Frederic J. Cheshire, Director of the Department of Technical Optics in the Imperial College of Science and Technology, South Kensington, was appointed Honorary Head of the Technical Optics Department of the Northampton Polytechnic, in accordance with the schemes of the Board of Education and of the London County Council for the provision of instruction in technical optics.

Tyneside Power Supply Data.—At a meeting of Newcastle-upon-Tyne Chamber of Commerce, on the 3rd inst., Mr. Turnbull, of North Shields, representing the Electrical Section of the Chamber, said that Section had been requested by the Board of Trade to supply evidence in regard to the use of electric power in the district, and the Section asked for the appointment of a Sub-Committee from the Council to assist. Among the information required was as to the saving in the cost of power by the use of electricity, and the effect upon industrial development, convenience of electricity when adding new machinery, and its adaptability to awkward situations, and the possibility of the use of waste heat from coke ovens and blast furnaces. Messrs. E. L. Beckingham, H. Pyle, and B. C. Browne were appointed to act.

A New Electrical Furnace.—A new type of electric furnace has recently been constructed in Sweden, which is especially useful as an economical small unit for crucible works and steel foundries. In addition, it may be made suitable for copper smelting, glass melting, and for melting various alloys. The furnace is of the arc type, but differs from existing ones: it is cylindrical, with closed ends. Two of the electrodes enter the furnace horizontally, one in the centre of each end; the third electrode is vertical, entering at the top in the centre.

Heating is by radiation from the arcs, but their deflection upon the bath is also of material assistance. The furnace is built with a horizontal cylindrical steel shell, rolling in cradles or tilting round a horizontal diametric axle. It is lined with acid, basic, or neutral material, according to the work for which it is intended. The currents entering at each end through the horizontal electrodes neutralise each other, but the returning current into the central electrode generates a field of force which deflects the arcs downward towards the bath. This is the essential feature of the new furnace, which differentiates it from those hitherto used. The points of the electrodes are usually kept 6 to 12 inches above the surface, but they can be adjusted as required. The furnace is adapted for work on cold or liquid metal, and the electrodes can be drawn back while the furnace is being charged. The circular form of the furnace is one of its greatest advantages. The radiant heat from the free-burning arcs is reflected on to the bath from the entire mirror-like incandescent inner surface of the vault. Yet the arcs are at such a distance from this roof that the danger of melting is minimised. A sound point in construction is that there is no break between the roof, the side walls, and the bottom, all being built together in one curve. To enable the furnace to be relined, the shell is in halves, bolted together. The electrodes, of graphite, are held together in a loose fit in water-cooled, insulated phosphor-bronze boxes, those for the horizontal electrodes being adjustable also in the vertical plane. Once the arcs are adjusted, it suffices to advance the side electrodes by about 1 in. per hour.—*Scientific American*.

U.S. Eight Hours' Law Suspended.—According to the *Labour Gazette*, the Orders for suspending the Eight Hours' Law were effective from date of the promulgations in March and April last, and they are operative "during the pending emergency and until further orders." In addition to applying to Government contracts, they apply to mechanics and labourers employed on work which, in the judgment of the Secretary for War, is important for purposes of national defence.

Coal Shortage Effects in Switzerland.—In order to effect greater economies in coal and electrical energy Swiss shops are to be closed at 7 p.m. Kinematograph and variety theatres are to be closed 12 days a month. Hotels and boarding houses will be allowed to heat only 25 per cent. of their rooms, or in exceptional cases, 50 per cent. Mountain hotels will be exempt from this rule.—*Times*.

The Electrolytic Production of Zinc.—Among the important metallurgical developments in British Columbia during last year was the completion and commencement of operation of the electrolytic zinc-producing plant, dealing with raw ore, at the works, at Trail, of the Consolidated Mining and Smelting Co., towards the beginning of 1916. The plant was in continuous work during the remainder of the 12 months, and is now turning out from 25 to 30 tons of spelter per day, which means that from 150 to 200 tons of ore are being treated daily. The total production of spelter by the new plant during last year is returned at approximately 6,810 tons. The installation was designed primarily to treat the complex zinc-lead ore, of which large reserves have been proved. The ore is roasted, and then leached with a solution of weak sulphuric acid; this dissolves out the zinc, which is then precipitated in electrolytic tanks. The lead and low silver contents of the ore remain as an insoluble residue from the leaching process, and are sent to the lead furnaces for smelting. This process enables the zinc contents of the ore to be saved—at least, in a large part—and also makes a much better product for the lead-stacks than the crude ore. The cost of producing zinc by this method is stated to be about the same, or possibly a little higher, than by fire smelting, but the latter process could not be used with the particular ore in question. At the beginning a number of difficulties were met, but they were eventually successfully overcome, these being, perhaps, necessarily incidental to the standardisation of the production in a large way of electrolytic zinc, and it is expected that, as the staff becomes more familiar with the operations, further improvements will be effected. Before the plant was completed further contracts, at the request of the Imperial Munitions Board, were entered into for an increased supply of zinc, which rendered necessary very large additions to the installation as originally designed, but the completion of which has been delayed owing to the difficulty experienced in obtaining deliveries of electrical machinery.

Industrial Reconstruction.—A scheme has been elaborated for a Council for the Study of Industrial Reconstruction, and a meeting is shortly to be held at which the proposals advanced by those prominently associated with the movement will be explained. A manifesto signed by a large number of well-known professors, editors of trade journals, and officers of trade associations sets forth in fair detail what the scheme is. We give some extracts below, and would refer readers who may be sufficiently interested in the matter to desire further information to the Secretary, Mr. F. W. Galton, care of Messrs. Benn Bros., Ltd., 8, Bouverie Street, E.C.4. It is considered that to meet the urgent needs of the times, increased efforts to develop our industries will be necessary on the following lines:—

1. The mobilisation of each industry for common action.
2. A greater degree of co-operation between manufacturers.
3. Co-operation between labour and capital, and the avoidance of industrial strife.
4. A more complete association between scientific institutions and traders.
5. Education better adapted to our commercial needs.
6. Each industry to be studied as a whole, and freed from unnecessary internal competition.
7. Every trade to present a united front to foreign competition.
8. Output regarded as a duty by both capital and labour.
9. Encouragement by the Government of the activities of traders with a minimum of interference.

The necessity for greatly increasing the national output is so imperative that some national scheme which shall ensure the securing of these objects is considered necessary.

It is suggested that a national organisation, along the lines of the Whitley Report, should be established, which will retain all the sterling qualities of our individualistic system, and add ordered force to ensure greater activity; also that such an organisation will need to provide for the representation of all classes of persons engaged in a given industry; that industry should, therefore, be enfranchised, and every man and woman, employer and employed, given a vocational or trade vote, by means of which this representation would be effectively realised; that every citizen should have the right to register with some approved Trade Association or Trade Union, and thus an Industrial or Vocational Register properly classified would be produced; that Trade Councils should be elected in each industry from the Trade Associations and the Trade Unions, upon a truly representative basis, so as to be able to speak in the names of the whole of their respective industries; that all questions between the Government and a given trade should be delegated to the Council of that trade to deal with; and that questions of output, education, trade schools, scientific research, export, wages, profits, markets, tariffs, &c., &c., should be settled in each trade by the Council of that trade, and national funds spent upon these matters dispensed through the Trade Councils.

Feeling that the time has come when the discussion of these matters should take a more detailed and practical form, those responsible for the manifesto have put forward various heads as a basis for further study.

These heads are concerned with the organisation of separate trades; a Government Department to promote or encourage trade; Trade Unions and Associations; Trade Councils (consisting of representatives of Trade Associations, Trade Unions, and aldermen elected by the Council on the nomination of Government Departments; and, lastly, work. "A very large proportion of the work now badly done by various Government Departments could be delegated to these Trade Councils, and would be more effectively performed. Reconstruction work, which largely depends upon industrial prosperity, could be undertaken by these Councils with a better prospect of success than it would have in any other way."

Generally, the scheme involves the establishment of a complete, new system of trade government comparable to our existing system of local government, with a Ministry at the head with powers similar to those of the Local Government Board, controlling numerous Trade Councils with powers comparable to those of existing County Councils. It recognises the essential principle that industrial interests should be grouped by trades, and not by localities.

National Insurance (Unemployment) Acts, 1911-1916.—

The following are further decisions of the Umpire:—Contributions are payable in respect of:—

2,388 X. All workmen engaged in making, including welding, stamping and machining, fernules for water-tube boilers.

This decision amplifies decision A 1,263 (*Board of Trade Journal* of January 30th, 1913).

2,389 X. Workmen described as painters employed by a firm of manufacturers, and engaged wholly or mainly in painting street lanterns or steel book-stacks at the works.

The Production of Nitrates in the United States.—

The U.S. War Department has announced that the Nitrate Supply Committee recommends the Government to use the synthetic ammonia process of the General Chemical Co., and to allocate out of the £4,000,000 nitrate supply appropriation a sum of £600,000 for this purpose, to build a plant having an output of 60,000 lb. of ammonia per 24-hour day, as well as a sum of £120,000 for a plant to oxidise ammonia to nitric acid and concentrate the acid, the output being equivalent to 24,000 lb. of 100 per cent. nitric acid per day.

A further sum of £40,000 is asked for, to experiment with a view to the industrial development of the Bucher process for the production of ammonia, which is owned by the Nitrogen Products Co. in the States. The installation of by-product coke ovens is also to be accelerated. The decision as to the more extensive installation of nitrogen fixation processes and water-power development in con-

nection therewith is to be postponed until the plants above mentioned are in operation. A reserve of half a million tons of Chile saltpetre is to be accumulated as a matter of urgency.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—

Officer for the Week.—Second Lieut. E. A. Ullmann.

Monday, October 15th.—Drill and Elementary Bridge Construction for No. 3 Company, Left Half Company, 6.30. Signalling Section, 6.30. Recruits' Drill, 6.30.

Tuesday, October 16th.—Physical Drill and Bayonet Fighting, 7.30.

Wednesday, October 17th.—Drill and Elementary Bridge Construction for No. 1 Company, 6.30.

Thursday, October 18th.—Drill and Elementary Bridge Construction for No. 2 Company, 6. Signalling Section, 6.30. Ambulance Section, 6.30.

Friday, October 19th.—Drill and Elementary Bridge Construction for No. 3 Company, Right Half Company, 6.30.

Saturday, October 20th.—Commandant's Parade for Route March and Drill, Parade at Headquarters, 2.45 p.m. Uniform. A and B N.C.O.'s and Men are reminded that one Route March per month is compulsory.

Musketry.—The Range at Belvedere Road will be open every Tuesday, Wednesday, and Thursday evening from 5.30 to 7.

Medical Examination.—The Medical Officer will attend at Headquarters for this purpose every Thursday at 6.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

Institution and Lecture Notes.—The Faraday Society.—

A general discussion on "Pyrometers and Pyrometry" will be held on Wednesday, November 7th, at 8 p.m., in the rooms of the Royal Society of Arts, John Street, Adelphi, London, W.C. 2.

Sir Robert Hadfield, Bart., F.R.S., President of the Society, will preside over the discussion and deliver an introductory address.

Dr. E. F. Northrup (Trenton, N.J.) will send in a communication entitled "High Temperature Production and its Measurement."

Dr. Ezer Griffiths and Mr. F. H. Schofield, B.A., B.Sc. (National Physical Laboratory) will read a paper on "Pyrometer Standardisation."

Mr. R. S. Whipple (Cambridge) will read a paper on "The Advantage of Burying the Cold Junction of a Thermo-couple as a means of Maintaining it at a Constant Temperature."

Mr. Richard P. Brown (Philadelphia) will read a paper and give a demonstration on "The Automatic Control Measurement of High Temperatures."

Prof. J. O. Arnold, F.R.S. (Sheffield) will speak on "Pyrometry Applied to the Hardening of High-Speed Steel."

Mr. Cosmo Johns (Sheffield) will speak on "Determining the Temperature of Liquid Metals by Means of Optical Pyrometers."

Dr. W. H. Hatfield (Sheffield) will read a paper on "Pyrometry from the Standpoint of Ferrous Metallurgy."

Mr. H. Watkin (Stoke-on-Trent) will read a paper on "The Measurement of High Temperature by Means of Pottery Materials."

Mr. C. R. Darling will read a paper on "Base-Metal Thermo-Electric Pyrometers."

Dr. J. W. Mellor, Mr. F. Twyman, and Mr. G. E. M. Stone will also contribute to the discussion.

Instruments will be exhibited by Mr. Richard P. Brown, the Cambridge Scientific Instrument Co., Messrs. Hadfields, Ltd., Mr. H. L. Heathcote, Mr. Robert W. Paul, and Messrs. Siemens Bros. & Co., Ltd.

Wages of Foremen Engineers.—

A deputation from the London Association of Foremen Engineers waited upon the Ministry of Munitions, on Tuesday, to call attention to the rate of wages paid to foremen in the engineering trades, which was stated to be in many cases lower than those received by even unskilled hands. It was said that in many cases they had the sympathy of their employers, but such employers were helpless without the sanction of the Ministry. The deputation was informed that although any increase in wages in a controlled establishment of any members of the staff must be approved, it was recognised that the foremen did important work. The merits of different cases varied largely, but the Ministry of Munitions was in sympathy with those foremen who did special work, and would not raise any objection in such cases to any advance of salary which might be agreed upon between employer and employé. In asking for such approval, the nature and extent of the extra work should be clearly stated. If the foreman could not agree with his employer as to the amount of increase, he could apply to the Minister of Labour, Industrial Department, and an arbitrator would be appointed.—*Morning Post*.

Appointments Vacant.—The Chief Engineer, War Department, Salisbury, is advertising in our pages to-day for competent men, who are required immediately to fill the following positions:—Electrician, mains engineer, shift engineer, engine driver, fitter, fitter driver, joiner, wireman, and wireman's mate. Electrical fitter (50s.), for Chester Corporation tramways; oil engine and dynamo attendants (35s. to 40s.), for the power stations in the Northern Command; Londonderry Corporation wants a charge engineer for its generating station. See our advertisement pages to-day.

The Ventilation of the Tube Railways.—In an interesting communication to the *Times*, General Sir Desmond O'Callaghan refers to the crowding of the tube railway stations by aliens during air raids, and suggests that if a bomb deranged the ventilating arrangements these people might be suffocated. There is, however, little danger on this score: the tubes are not all supplied with power from the same source, and it would have to be a very lucky shot indeed that would cut off the supply from even a portion of the system for a long period. Moreover, there is an immense volume of air in the tunnels, which is always more or less in movement, and the stairways are open to the atmosphere at the surface.

Inquiries.—Makers of "Crosby" clamps and wood separators for storage battery plates are asked for.

The Australian Strike.—Additional restrictions on coal and power for industrial purposes have thrown 13,000 more hands out of work in Victoria. Oil engines, and even motor-car engines, are being used to run machinery.—*Times*.

London Electrical Contractors' Dinner.—We read in the *Electrical Contractor* that the London Section of the Electrical Contractors' Association will hold a dinner on November 7th at Tricity House, Oxford Street. A paper by Mr. A. F. Berry on "Electric Cooking" will follow.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Mr. W. H. SHORTER, superintendent in the sales department of the Marylebone electricity works, has obtained a commission in the R.F.C.

Mr. T. ROLES, city electrical engineer, Bradford, who has been "lent" to the Coal Controller's Department for the purpose of explaining to Yorkshire local authorities the Controller's scheme of coal economy, has now got to work on his new task, and has commenced operations on his own city and Leeds and Halifax.

West Bromwich T.C. has increased the salary of the borough electrical engineer, Mr. W. A. JACKSON, from £400 to £500 a year.

Canterbury T.C. has increased the salary of the electrical engineer, Mr. BLASCHECK, from £350 to £400 per annum.

Mr. M. BELL has been appointed superintendent of the generating station at the West Bromwich Corporation electricity works at a salary of £300 a year.

The Bath Corporation has increased the salary of Mr. A. R. SHAWLEY, the deputy city electrical engineer, by £25 per annum.

Mr. E. P. AUSTIN, chief assistant engineer at the Chesterfield electricity works, has been appointed chief electrical engineer at the Sheepbridge works. He has held the position at Chesterfield since 1906, and the Electricity Committee, in accepting his resignation, have placed on record their appreciation of his energy and ability. A successor will be appointed at £230 per annum.

The Chester Electricity Committee has granted leave of absence to Mr. PERCY HEARD, who has been called up. It is recommended that, as a temporary measure, Mr. G. E. SWIFT, the mains superintendent, perform the duties of station superintendent at £75 per annum, in addition to his existing salary of £200.

Marylebone Electricity Committee recommends that the salary of Mr. E. J. JENNINGS, secretary and accountant to the electricity department, be increased from £500 to £525 per annum, and afterwards by £25 per annum to £600; also that the salary of Mr. C. H. SMYTH, mains engineer, now £500, be advanced on exactly the same scale.

Mr. H. S. ELLIS, electrical engineer to the South Shields Corporation, has been invited by the Controller of Coal Mines to act as an honorary representative of the Coal Control Department, and the Corporation has given leave for him to devote part of his time to the work. The district in which Mr. Ellis will work includes the counties of Northumberland and Durham, in which area he will have to interview the Corporation officials, and the engineers of electricity, gas, and water undertakings to discuss questions of coal economies. The installation of electric or gas cooking and heating appliances will also be dealt with, with the object of saving coal.

General.—Mr. T. A. ST. JOHNSTON has just resigned his position as assistant electrical engineer at the Associated Equipment Co.'s Works, at Walthamstow, to take up a new appointment as works superintendent with the Micanite and Insulator Co., Ltd., whose works are in the same district. He was presented with a cigarette case from the employees in the electrical department on leaving.

Mr. H. N. HICKLEY, managing director of Messrs. Newtons, Ltd., electrical engineers, of Taunton, on his marriage to Miss Meade-King, of Walford, has been presented by the employees with a silver kettle with spirit lamp and stand, a silver cigarette box, and an illuminated album.

The marriage has taken place of Mr. G. BIRKLEY ROLL, B.Sc., A.M.I.E.E., and Miss Violet McKenzie Scott, of Redford Park, W.

Mr. NORMAN ROGERS, formerly with the B.I.H. Co., Rugby, has relinquished his appointment in the Industrial Arts Department of the Cincinnati Public Schools in order to prepare for active service with the United States Officers' Reserve.

Roll of Honour.—Captain R. S. ROONEY, R.E., who has died of wounds, was an electrical engineer with the British Electric Plant Co., Ltd., Alloa.

Private H. WEST, Durham L.I., who has died from wounds received in action, was employed at the Bradford Corporation electricity works.

Gunner J. HARRISON, Australian F.A., who is in a London hospital wounded, was formerly employed in the Leeds Corporation electricity department.

Sergeant F. C. LUSCOMBE, Seaforth Highlanders, who has died from the effects of gas poisoning, was prior to the war an electrician with Rolls-Royce, Ltd.

Lieutenant ERIC SLEIGHT, who has been wounded, and has had his foot amputated, enlisted whilst manager of the tramways at Carlisle.

Lance-Corporal A. BROWN, R.E., aged 23, who has been awarded the Military Medal, was employed as an electrician with Messrs. Dick, Kerr & Co., at Preston. He gained the distinction for laying a cable across "No Man's Land" on the day the infantry went over, and under heavy fire.

Bombardier W. D. THOMPSON, West Lancashire Field Artillery, who has been awarded the Military Medal, was employed by Blackpool, Lytham and St. Annes Tramway Co.

Lance-Corporal H. PARKER, South Lancashire Regiment, who has been killed in action, aged 22, was employed at the B.I. & Helsby Cable Works.

Flight Sub-Lieutenant J. D. GRANT, R.N., drowned at sea as the result of a seaplane accident, was in the service of the General Electric Co., Ltd., at Manchester.

Captain R. H. UTHOFF, R.E., who was mentioned in this column last week, was the head of the engineering department at one of the works of Messrs. Pilkington Bros., Ltd., not their chief electrical engineer. Mr. P. M. Hogg is the company's chief electrical engineer.

Lieutenant A. J. ADAMSON, R.G.A., who has been killed in action, was a clerk with the Oxford Electric Light Co., Ltd.

Temporary Lieutenant F. H. WEBB, R.F.A., who has been awarded the Military Cross for conspicuous gallantry and devotion to duty, is a son of Mr. S. H. Webb, president of the National Federated Electrical Association, with whom he was associated in his business at Leicester up to his joining the Army in the early days of the war.

Obituary.—Mr. B. G. ARKWRIGHT.—The death is announced, at the age of 55, of Mr. Bernard G. Arkwright, a director of Sir W. G. Armstrong, Whitworth & Co., Ltd., who was also manager of the company's engine works.

Will.—The late Mr. F. A. HOPKINSON, chairman of Messrs. J. Hopkinson & Co., Ltd., Huddersfield, left £56,101 gross.

NEW COMPANIES REGISTERED.

Corona Lampworks (Ireland), Ltd. (4,498).—Private company. Registered in Dublin, October 3rd. Capital, £6,000 in £1 shares. Manufacturers of and dealers in all kinds of electric bulbs, lamp fittings, &c. Agreement with the Corona Lampworks, Ltd. The subscribers (each with one share) are:—W. Hepworth-Collins, 10, Ascham Street, Kentish Town, London, N.W.; C. Shields, 93, Foulden Road, Stoke Newington, London, N.; cashier. The first directors are:—Geo. N. Ogilvie, W. Hepworth-Collins, and C. Shields. Solicitor: Chas. M. Worsley, 2, Walbrook, London. Secretary: C. Shields.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Harold Wood Electrical & Engineering Supplies Co., Ltd.—Memorandum of satisfaction in full on August 31st, 1917, of debentures dated October 17th, 1913, securing £600, has been filed.

Rural Electricity Supply Co., Ltd.—Particulars of £1,700 debentures created August 10th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Suffolk Electricity Supply Co., Ltd.—Particulars of £2,000 debentures created August 22nd, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. The above debentures are in addition to the previous issue not exceeding half the amount of the paid-up capital by consent of the holders of the previous issue.

CITY NOTES.

Marconi Wireless Telegraph Co. of Canada, Ltd.

The report for an 11-month period states that for the third successive season the company has had to contend with the abnormal conditions created by the war, and, despite the difficulties imposed by various restrictions, an increased volume of Transatlantic traffic was handled between the company's Glace Bay station and Great Britain, as was anticipated. This improved volume is since being well maintained. The value of the company's organisation, both to shipowners and to the Naval authorities, has again been demonstrated. The school of instruction conducted by the company has been a

factor in contributing to maintain the company's staff in replacing operators assigned for duty in all parts of the globe. Schools in affiliation with the company are also conducted on the Pacific Coast at Vancouver and Victoria, B.C. The output of the company's plant in Montreal was somewhat less than during the previous year, due to the fact that a smaller number of installations was required for Naval purposes. Advantage was taken of this opportunity to develop an improved type of ship apparatus, combining the best practice in design with reliability of operation in unskilled hands. Compact and self-contained, the new cabinet set, either of medium or large size, can be installed on shipboard in short order, thus meeting the frequent demand under present conditions for emergent installations. This new design has received favourable comment both in Naval and mercantile quarters, and its success has been followed up by the development of a smaller set on similar lines, which should open up a large field for service on cargo and smaller vessels, where the cost of wireless equipment hitherto has been regarded as prohibitive. The company has subsequently been awarded further important orders for the purchase of a considerable number of wireless sets of various types. As a further step in the company's policy for increasing the facilities of its service to shipowners, a divisional office for the Maritime Provinces has been established at Halifax, thus completing the plan of maintaining stores and offices at the important divisional points of Vancouver, Toronto, Montreal, Halifax, and St. John's, Newfoundland. The number of wireless telegraph stations operated by the company on shipboard has shown an increase during the year, notwithstanding the fact that several installations had been lost or transferred to other routes. The same difficult conditions had prevailed with regard to message traffic to and from ships, due not only to general dislocation of sailing schedules, but also to strict censorship and other limitations imposed on commercial messages, nor can any improvement in these adverse conditions be looked for during the period of the war. The directors have not yet been able to obtain from the Government a basis of settlement in respect of remuneration for the use of certain coast stations taken over by the Naval Department since the commencement of the war, or compensation for other services rendered to the Admiralty and elsewhere.—*Financier*.

Escher, Wyss & Co.—The report of Escher, Wyss & Co., of Zurich, which deals with the year ended March 31st, 1917, states that the production in most departments was again approximately on the level of an ordinary peace year. The great difficulties experienced in obtaining raw and other materials, the forwarding of goods, and in connection with the enhanced cost of living for the workmen, considerably increased as compared with the previous year. It was necessary to pay unprecedentedly high prices for some materials, and frequently to pay before delivery. The arrival of orders continued very satisfactory, especially the extensive contracts for hydraulic turbines, whilst a very favourable turnover was also obtained in steam turbines. Special apparatus was made for the native chemical industry, and large orders have recently been received for compressors. After allocating £41,000 to depreciation, as against £32,000 in 1915-16, the accounts exhibit net profits of £20,000, as compared with £17,000, and the dividend is 5 per cent., as contrasted with 4 per cent. in the preceding year.

Companies to be Struck Off the Register.—The following companies will be struck off the register unless cause is shown to the contrary within three months:—

Acton Battery Co., Ltd.
Electrical Sales Promotion, Ltd.
London Battery & Manufacturing Co., Ltd.
Mies' Electrical & Chemical Culture, Ltd.
Photo-Telegraph & Cable Co., Ltd.
Scandinavian Water Power & Paper Mills, Ltd.
Trade Journals, Ltd.
United Cablegram Co. of France, Ltd.
United Kingdom Manufacturers' Representative Association, Ltd.

Shanghai Electric Construction Co., Ltd.—Interim dividend at the rate of 5 per cent. actual (10s. per share), less tax.

Rio de Janeiro Tramway, Light & Power Co., Ltd.—Dividend, 1½ per cent. on the capital stock.

Sao Paulo Tramway, Light & Power Co., Ltd.—Dividend, 2½ per cent. on the common stock.

Cuba Submarine Telegraph Co., Ltd.—Interim dividend 5 per cent. per annum, free of tax, on ordinary shares.

Oriental Telephone & Electric Co., Ltd.—Interim dividends of 3 per cent. on the 6 per cent. cumulative preference shares for the current year, less income-tax, and 4 per cent. on the ordinary shares, free of income-tax.

Indo-European Telegraph Co., Ltd.—Interim dividend for the half-year ended June 30th last at the rate of 5 per cent. per annum, free of tax.

Direct United States Cable Co., Ltd.—Interim dividend of 2s. per share, less income-tax at 5s. in the £, making with the interim dividend already paid a total distribution of 4 per cent. for the half-year ended September 30th.

Royce, Ltd.—Dividend, 5 per cent.; £5,000 is written off goodwill, and £224 is carried forward.

Glenboig Union Fireclay Co., Ltd.—The directors have placed £12,000 to reserve, and out of surplus of £62,000 they recommend an ordinary dividend of 35 per cent., less tax, and carry forward £22,579.

Calcutta Tramways Co., Ltd.—Interim dividend on the ordinary shares at the rate of 2½ per cent., free of tax.

STOCKS AND SHARES.

TUESDAY EVENING.

THE outstanding feature in the markets at the present time is the strength of all the gilt-edged stocks. The rise in the prices of the 5 per cent. War Loan and Consols has stimulated subscriptions to the new War Bonds, applications for which are now flowing in freely. There is no lack of money available for investment. The fine news from the Western Front plays a prominent part in helping prices; and there are few markets in the Stock Exchange which have not responded to the latest advance in Flanders.

To give some idea of the scarcity of good investments which prevails, we may observe that it lay within our province the other day to make some inquiries for what shares were on offer in the list of home electricity companies. The principal dealers in the market ran through the whole catalogue of shares, and out of the list of the best concerns there were scarcely a couple of hundred shares on offer altogether. This is as good an illustration as can be cited of the difficulty which meets the intending investor in such companies. Of course, if he likes to bid fancy prices—that is to say, prices well above the market figures—he might possibly be able to lay in a few hundred pounds' worth of stock. But unless he is prepared to do this, his choice is limited in the extreme. The only change on the week is a rise of ¼ in Westminster ordinary, which has advanced the price to 6½, so that the yield at the present time is barely 5½ per cent. on the money.

The Home Railway market is better, reflecting the strength of Consols; and the improvement has been shared by the Undergrounds, as well as by the stocks in the heavier list. The rise in Undergrounds has naturally been the subject of quiet jesting, although it follows events which were very far from humorous. Underground Electric incomes gained a point to 83½, and the ordinary shares at 1½ are ½ higher. The shares just lately have received some attention from the speculative investor in the country, and the shilling shares at 6s. 3d. are a few pence better on the week. Metropolitan regained the ¼ which they lost the other day, and the various Central London stocks maintain the rises which they recently put on.

Mexican affairs are still rather hopeless, but the latest news is to the effect that there is a chance of a change in the Mexican Ministry, which, if it came about, would make the attitude of Mexico much more definite towards Germany, bringing her conspicuously into line with the Allies. The dramatic rise in the price of silver, the metal, has been followed by a sharp fall. But silver, in spite of the reaction, still commands a big price; and, of course, the value of the white metal makes a considerable difference to Mexican issues of all kinds. Mexican Light and Power preferred has risen to 35, a jump of 3½ points, and Mexico Tramways Firsts are 2 up at 46½.

No improvement has occurred in the British Columbia group, and Brazilian Tractions continue weak at 46. The Anglo-Argentine Tramways market is very steady, there being noticeable inquiry for the first preference shares. Labour troubles are still agitating the Argentine Republic; and it is only within the past few days that a partial resumption of railway traffic, under the protection of the military, has got under way.

The telegraph list is quiet, with small improvements in Anglo-American Telegraph deferred stock and in West India and Panama shares, the latter recovering the slight decline which occurred last week. Great Northerns are £1 up at 31, but Indo-Europeans at 53½ show a fall of the same amount. There is a good deal of activity in American Marconi shares, and the price has risen to 22s., though the parents keep about 32, and Canadians seem unable to get away from the price of 10s. 6d., at which they have stuck for some weeks.

In the manufacturing group, British Insulated have dropped back to 14, but Telegraph Constructions have reached the level 40. Small falls have occurred in British Westinghouse preference and in Babcock & Wilcox shares. The recent animation in Edison Swan has given place to quietude; and although the price of the shares keeps steady about a guinea, speculation has died out for the time being. The fully-paid remain at 35s. Henleys have risen to 15½.

Business is good amongst rubber shares, where prices are well held, and the reaction in the price of rubber to 2s. 8d. had little effect. Movements, however, are narrow, and of little consequence from day to day. Base-metal shares are generally better, a good dividend from the Rio Tinto Copper Co. putting up the prices in their market, while the conclusion of the strike on the Broken Hill field has brought about improvement in the Barrier shares. There is not much doing amongst armaments, though several of the explosives are again mounting.

Good wishes have poured in upon Mr. H. B. Renwick, the managing director of the County of London Electric Supply Co., upon his recent appointment in the Ministry of Food. Considering the wide experience which Mr. Renwick has had in the way of organisation in business matters, the appointment should prove a valuable one to the country, and everyone will wish him success in his new office.

Science and Industry in South Africa.—In his presidential address to the S.A. Association for the Advancement of Science, reported in *Nature*, Prof. John Orr stated that the Government had not always fully realised in the past the powerful aid of science and scientific research in general and industrial development, and had paid totally inadequate salaries to the personnel of its scientific departments. But all this was going to be changed; science had gained immensely in prestige since the war began, and perhaps the greatest lesson of the war had been the realisation of the necessity for more scientific methods in relation to industry. They must realise that the whole fabric of industry was based on science, and Governments were now recognising it as their duty to promote scientific research on a national scale.

The land abounded with examples of neglected opportunities. The absence of a "primary" iron and steel industry in South Africa was most keenly felt; they had the raw materials in coal and ore. A successful experimental plant, constituting the first electric furnace in South Africa, was erected by the Chamber of Mines during the past year for making steel castings (shoes and dies) from scrap metal, and the manufacture of bar iron, &c., from scrap metal had been carried on for some years in the Transvaal. Such industries had been referred to as "bastard" industries; primary industries utilising the raw materials were essential. A start was made in June in electrochemical industries, when a factory for the manufacture of carbide was inaugurated on the Rand; but electrochemical industries in other parts of the world relied mainly upon cheap electricity derived from water-power, and it was of the utmost importance in the industrial development of the country that the Government should spare no expense in having the water-power resources of South Africa immediately investigated.

Portable Electric Lighting Plants.—It is stated that in both the French and Italian armies portable electric lighting plants are being largely made use of for the illumination of officers' quarters. The sets consist of a water-cooled petrol engine, direct-coupled to a generator, both being mounted on a wooden platform capable of being carried by a couple of soldiers. Wiring and lamp sockets are packed separately, and are in charge of an electrician. The entire outfit is brought up on a motor wagon, and with the aid of three or four men, staff quarters can be fitted up with an electric lighting installation in about an hour's time.

UNION OF SOUTH AFRICA MUNICIPAL ELECTRICAL UNDERTAKINGS.

By E. POOLIE, A.M.I.E.E., Assistant Borough Electrical Engineer, Durban.

(Abstract of paper read before the Engineering Section of the NATAL SOCIETY FOR THE ADVANCEMENT OF SCIENCE AND ART, at Durban, on August 28th, 1917.)
(Concluded from page 321.)

Tramways.—Private companies were first in the field in nearly all the towns in South Africa with both horse and electric tramways, and even to-day the electric tramways at Cape Town, Camps Bay, Port Elizabeth, and Kimberley are in the hands of such. Other towns have acquired companies' undertakings operated by horses, which have been electrified by power obtained from the lighting station. Boksburg and Germiston, however, purchase their current for tramways as they also do for lighting, and have adopted the railless system, as has also Bloemfontein, the system adopted by all the other towns being the overhead trolley. Motor vehicles serve as feeders to the main tramway routes at Johannesburg, Pretoria, and Pietermaritzburg, while in the case of Benoni the municipality has lately inaugurated a system of electric buses, five in number. Durban has a parcels collection and delivery system, which alone brought in a revenue of £700 last year. A universal gauge of 4 ft. 8½ in. is adopted for the track. The steepest grade and sharpest curve are at Cape Town, being 1 in 8 and 28 ft. radius respectively, while in miles of track Johannesburg has just over 65 miles, or 42 route miles.

In charges for current for tramways, Durban and Bloemfontein are the only two instances where one penny per unit is charged. In road maintenance, some towns charge the tramway department half cost, while others pay in full. A wayleave is charged in the case of Camps Bay Tramway Co. of £50 per mile.

In fares, the penny cash fare does not yet apply to all towns. Pietermaritzburg, Cape Town, Bloemfontein, and East London, however, have adopted it.

Street Lighting.—Many changes have taken place in street lighting in the last few years, and whereas at one time all large towns used arc lamps for their principal thoroughfares, the introduction of the high-candle-power metal-filament and half-watt lamp has practically forced the arc lamp on the scrap heap.

The location of lamps is a point which requires careful consideration; and in my opinion centre lighting from span wires is difficult to improve on. Some few towns are even now adopting this style of construction, which permits of the pavements under the verandahs being lighted as well as the roads, and where trees line the footpaths, as they so frequently do in South Africa, there is far less obstruction to the light than there is with side poles.

The switching of street lamps is in many cases carried out by time switches, though one or two towns have distant solenoid control.

The maintenance of street lighting is an important matter as well as costly, but thanks to the introduction of the modern vehicle (which rightly is an electric one), Durban, by way of example, is able to carry out all its repairs and replacements (and there are over 2,500 lamps to look after) with one man and two natives, whereas at one time it required three men, six Indians, and four natives.

House Services, &c.—Connections to houses are made by overhead as well as underground mains, and in the case of the former the class of wire used, though not highly insulated, offers some sort of protection to those who might come in contact with it. It is a double or triple-braided wire, sometimes compounded, and withstands the weather conditions very well. The application fee covers the cost of the service up to a certain distance, beyond which charges are made, in some cases half the cost, and in others the full cost of the extra material required.

There is a vast variety of meters in use. There are few towns which do not charge meter rent, varying from 6d. to 2s. 6d. per month, which, in the case of Pietermaritzburg, brought in a revenue of over £1,000 last year.

Generally the wiring rules are all based on the Rules of the Institution of Electrical Engineers and Fire Office Rules, though several towns publish their own, which embody special rules to suit the local conditions. Some will not allow casing or bobbin work, one other prefers it, some again carry out consumers' wiring; the majority are against municipal trading in this line, but roughly 50 per cent. of them have adopted assisted wiring, while a few hire out apparatus.

We find all sorts of tariffs from as low as 375d. for a restricted-hour supply at Durban to as high as 1s. per unit at several of the smaller towns, and by going beyond the Union we find a charge of from 1s. 6d. to 2s. at Bulawayo. Durban is cheapest all round, the lighting rate having been lowered to 5d. per unit since August, 1917.

The total European staff of all our municipal stations is about 800 in number, exclusive of tramway staffs.

Finance.—In practically every town the control is vested in the hands of the financial head of the Corporation—the

town treasurer. In favour of this system may be held the fact that the town treasurer is a specialist on finance, but against it is often held out the loss of expediency and economy caused by the unnecessary duplication.

With the recently introduced Government audit, as well as the inter-municipal audit, I fail to see why a proper control could not be kept if the electrical engineer did the accountancy, and there would be no continual overlapping as is now the case. Before, however, such a state of affairs can come about it is necessary to have some universal form for financial statements, as is the case at home.

Though the electrical engineer is generally in control of his own stores, in the few larger towns the control is in the hands of the general storekeeper, who when he buys has to consult the electrical engineer as to details, and when the goods arrive has again to consult the electrical engineer as to whether the goods are up to sample.

On account of the various ways of costing adopted, it is practically an impossibility to make comparisons of working costs with any degree of accuracy.

In regard to the disposal of net profits, most of the larger towns appropriate a large portion to the relief of rates under a providing Act, the amounts set aside last year in the various towns being as follows:—

	Light.	Tramways.
Johannesburg	£49,003	£59,281
Durban	17,936	19,159
East London	1,500	—
Pretoria (1915)	10,000	—

The total amount that has been set aside in Durban since the inauguration of the electric light amounts to no less than £198,527. Other appropriations are in the use of net profits for capital expenditure, special sinking funds or reserve accounts.

The paper is accompanied by the tables printed on pp. 357-359.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

NEW ZEALAND.—Lamps, of patterns approved by the Minister of Trade and Customs, including "Incandescent Mazda" and "New Miniature" electric lamps, specially fitted and peculiarly adapted for microscope work, are now admitted free of duty into the Dominion in accordance with a revised decision by the Customs Department. [A "primage duty" of 1 per cent. *ad valorem* is payable on importation in accordance with the Finance Act of 1915.]

SOUTH AFRICA.—Among recent decisions issued by the Commissioner of Customs as to the classification of various articles under the Customs Tariff, the following are noted:—

	Rate of Import duty.	Rebate on goods manufactured in the U.K. and reciprocating British Colonies.
Insulating tape (sleeving) when imported by importers of electrical material, and on a declaration that it is to be used for insulating purposes ...	3 p.c. <i>ad val.</i>	Whole duty.
Patent quazare electrodes ...	3 p.c. <i>ad val.</i>	Whole duty.

SOUTHERN RHODESIA.—A Customs decision has been issued recently classifying parts of electric starters for motor cars for Customs duty, as follows:—

Chains are dutiable under Tariff heading 51c at the rate of 20 per cent. *ad val.* under the General Tariff, and at 17 per cent. *ad val.* under the Preferential Tariff on British goods.

Adjusters and parts are dutiable under 114b at the rate of 3 per cent. *ad val.* under the General Tariff, British goods being admitted free of duty.

TERRITORY KNOWN AS GERMAN EAST AFRICA.—Regulations have been made by the Senior Customs Officer at Nairobi setting out the conditions under which goods may be conveyed through the occupied territory of "German East Africa" to a foreign port. The text of these regulations, which are at some length, was given in the official *Board of Trade Journal* for July 26th.

CEYLON.—The Customs Tariff has been revised by an Ordinance, dated June 8th, which provides a new schedule of import duties. The general rate of duty leviable upon goods unspecified in the schedule has been increased from 5½ per cent. *ad val.* to 7½ per cent. *ad val.* Among the list of goods specified is copper—blocks, bars, plates, rods, wire, tubes, sheets, ingots, and scraps, on which the duty is Rs. 3 per cwt. The table of exemptions from import duty includes electrical machinery (and component parts) for electric traction and electric lighting, or for certain specified industries; electric accumulators, and lead, pig, and sheet.

BRITISH HONDURAS.—An Ordinance promulgated on June 23rd provides that the export duty on chicle be increased from ¼ cent (¼d.) per lb. to 1½ cents (¼d.) per lb. as from June 20th.

NEW PATENTS APPLIED FOR, 1917.

TWO IMPORTANT QUESTIONS.

Two events have occurred during the past few days which are of considerable importance to the electrical and other engineering trades. Both are concerned with the preparations which the nation must make in connection with the work of reconstruction. The closer one gets to the inevitable problems of demobilisation and reconstruction the more serious do they appear to be. Neither the nation nor our national industries dare adopt an apathetic attitude in regard to such matters. The work of the Ministry of Reconstruction promises to become more important than that of any other section of Government, for its operations will necessarily cover practically all departments of activity, and upon the wisdom of its decisions and their timely adoption and execution must depend consequences fraught with immense possibilities for good or for evil. From the many things that we have written here already the reader is aware that this is no newly-arrived-at conviction so far as we are concerned. But no excuse is needed for returning to the subject now; indeed, our desire is to do so with greater emphasis than ever before, so that the industries which we represent may be prevented from falling into the lamentable error of delaying action which is imperatively necessary. The two events which lead us to refer to the matter now are: (1) the appointment by the Minister of Reconstruction of a special committee to report upon questions connected with the supplies of raw material that will be required by British industries in order to restore and develop trade after the war, and the best means of securing and distributing supplies, due regard being had to the interests of the Allies; (2) the approval by the War Cabinet of the report of the Whitley Committee on the relations between employers and employed, and the authorising of the Ministry of Labour to proceed with the setting-up of Joint Standing Industrial Councils. The first of these decisions is designed to ensure that our own industry in its different sections and that of the Allied countries shall have their proper share of the raw materials that may be available or reasonably in sight, so that there may be the least possible delay in finding employment for millions of workers, so that distress from unemployment shall be at a minimum, and so that we may as speedily as possible ensure industrial prosperity to help pay for the war. We in England recognise quite as well as the enemy does how vital is this matter of raw materials, and we cannot afford to let the grass grow under our feet. The second decision mentioned is closely related to the first, for while work for Labour is impossible without supplies of raw material, the latter will not yield the required results unless everything in enlightened reason is done to secure that there shall be what we

NOW READY.

H. ALABASTER, GATEHOUSE & KEMPE,
4, Ludgate Hill, London, E.C. 4.

have come to call Industrial Harmony produced by the promotion of a sincere spirit of co-operation between employers and employed.

If we all consider the matter one of great urgency—there is absolutely no question in regard to merit or policy—we may feel that the time for talking has gone by, and that the period for definite action is already upon us. That being taken as agreed, what are the courses that we ought to pursue, and pursue at once?

During war time, in order that essential industries may have the wherewithal to produce what the Forces have required, the Ministry of Munitions has exercised what to all intents and purposes has amounted to rationing of essential materials. We know how great have been the difficulties and grievances of some manufacturers in consequence; it is more than probable that those difficulties and grievances might have been lessened had the organisation of our industries been more perfect. This leads us to suggest, and we desire to do so very pointedly, that when the whole of the industrial world is clamouring for raw materials for much the same purposes as we ourselves shall require them for, the difficulties and grievances will not disappear. It will be most unwise of us to expect Governments to permit a wild scramble for supplies on the part of the industrial representatives of all the nations. That would make neither for equity among the industries nor for efficiency, and we all know the harmful possibilities if prices of essential raw materials, perhaps somewhat limited in volume, were to be subject to private manipulation. Is it unreasonable, then, to anticipate that in respect of some materials which the engineering industries will require there may be a special duty devolving upon the organisations which represent those industries? In season and out of season we have tried to impress upon the electrical trade the pressing necessity for complete organisation, and to-day, looking ahead regarding the conditions under which we may have to operate for some time after the cessation of hostilities, we are compelled, in the real interests of the electrical and other engineering trades, to urge every manufacturer who so far has been content to whistle along his solitary course as an unassociated trader, to consider his ways. With absolute candour, and with sufficient reason, we may say that it is in his own immediate interests, and in the interests of the workers in his employ, that he become connected with a trade organisation, for it is through trade organisations that governments can most effectively deal when such matters as raw materials are concerned.

So much for the need for organisation. Now let us turn to the question of the Whitley report on industrial co-operation. We ought to be able to assume that every responsible head of a manufacturing firm has made himself acquainted with the recommendations of the Whitley Committee, which were put before the trade organisations some months ago, and which were editorially referred to in the *ELECTRICAL REVIEW* for July 6th and August 24th, 1917. If we are not right in making that assumption, we can only regret it and urge that every such representative, whether his be an associated or an unassociated business, secure a copy from the Government publishers at once. There has been so much general talking about industrial harmony during the past two years that no more of it is needed in manufacturing circles, for surely every manufacturer sees by now that there will not be anything approaching industrial peace unless appropriate, sympathetic, and far-seeing measures are taken to ensure it. What, then, is the next step? The Government has made it clear that in many of its future industrial negotiations it will give preferential consideration to industrial organisations in the councils of which Labour has its representa-

tives. Accepting this decision as irrevocable and as correct, it seems to us that the right course for the organisations which represent electrical and engineering industries is to call in suitable representatives of Labour to consider with them the whole question of these Standing Industrial Councils which are about to be set up, and prepare the way for smooth development along the lines of the adopted recommendations. We shall thus leave the period of general talk on co-operation and get down to something definite out of which what we all aim at may be carefully and amicably evolved. We trust that such conferences will soon be arranged on this particular matter in the electrical and engineering circles. The scheme can be more easily applied if the necessary measures be initiated through the medium of strong and representative organisations. Therefore, we arrive at the conclusion that what is called for by these two problems—raw material supply and industrial unity—is more complete organisation of manufacturers and their co-operation with Labour. We have scattered our efforts far too long—the reasons matter little to-day—this is the time for concentration, and for serious constructive operations based on the Whitley proposals now endorsed by the Government.

Government Shareholding in Germany. ONE of the first instances of great importance in which the German Imperial authorities have taken up a considerable financial interest in an electricity supply undertaking

has just arisen. It concerns the Elektron Works Co., which is utilising extensive lignite deposits in the vicinity of Bitterfeld as fuel in connection with the production of electrical energy, particularly, if not exclusively, for one or two of the Government works in that district for the fixation of nitrogen. The shares in question were formerly owned by the Berlin Electricity Works Co., and were part of the directors' scheme for participating in electrical undertakings for the purpose of possessing other electrical interests in the event, which in the meantime has taken place, of the Berlin works and plant being acquired by the Berlin Municipal Council. During the course of the present year, however, the A.E.G. relieved its subsidy of these shares, partly by a cash payment and partly by an exchange of shares, and in its turn the A.E.G. has been constrained to transfer the shares to the Imperial authorities. At the July meeting of the A.E.G. it was mentioned that negotiations were proceeding in regard to a change in the situation respecting the shareholding in the Elektron Works, and it is now stated that the entire interests have been sold to the State for the reason, as given, that the Empire needs the production of energy at the works in question for war purposes. The A.E.G. is said to have been compelled to make moderate sacrifices on the transfer, which have already been provided for in the accounts, and to have renounced the right of repurchasing the shares which the company possessed.

According to later information the State has acquired all the shares issued by, and the credits advanced to, the Elektrowerke by the Berlin Electricity Works Co. and the A.E.G. It is stated that the purchase price is understood to range from £2,000,000 to £2,500,000, although the form in which the payment has been or is to be made has not yet been disclosed. The expropriation of the undertaking will permit of the closest co-operation between this lignite power station and the Imperial nitrate works, to which power has been delivered at contract prices which, owing to the growth in working expenses during the war, left no profit to the company.

C. H. WORDINGHAM, President of the Institution of Electrical Engineers.

THE new President, Mr. C. H. Wordingham, is one of the veterans of the electric supply industry in this country, having begun his professional career under particularly auspicious conditions as the only pupil of that great pioneer, Dr. John Hopkinson, and returning, after a spell of experience with the early supply of electricity in London, and in the construction of telephone exchanges, to become his chief assistant.

Educated at King's College School, followed by some years at King's College in the Department of Applied Sciences, Mr. Wordingham earned his A.K.C., and throughout his career has shown a practical interest in his old college. The college authorities have no less shown their appreciation of their old pupil by electing him to a Fellowship and to a seat on the Council.

Receiving his baptism of fire at an early age when the Grosvenor Gallery power station was burnt down, Mr. Wordingham went through the experience of the change-over to Deptford, and he was thus intimately connected with the first large-scale extra-high-tension system in this country. After removal to Deptford, he took charge of the standardising department—an early indication of the important assistance to the cause of standardisation which the President later on was so largely to contribute. Returning to Dr. Hopkinson, the supervision of the contracts for the Manchester and Whitehaven power stations fell to him, and in 1894, at the invitation of the Corporation, he became chief at Manchester, the original power station being then a mere 2,000 kw. or so. In the years that followed, the developments at Manchester ran up to 50,000 kw., and included the practical working-out of a three-phase system for lighting, traction and power over a district of some 45 sq. miles. In a report to the Corporation as long ago as 1896, Mr. Wordingham advised the adoption of a three-phase, 10,000-volt system—subsequently reduced to 6,600 volts—and he laid down the essential economical principle of concentration of plant in one large power station; he thus sowed the seed which has produced the present harvest in Manchester, where, under the control of Mr. S. L. Pearce, one of the finest and most successful municipal undertakings in the world has been established. The President's advice became then in much demand, and he determined to set up a consultative practice; a busy

and useful two years followed—then the "Destiny that shapes our ends" brought about the unexpected in the shape of an invitation from the Board of Admiralty to become their first civilian electrical engineer-in-chief, which Mr. Wordingham felt compelled to accept. Those who know of the great work he has done there in the years that have followed can testify to the successful result of the President's labours. An entirely new department had first to be organised, at a time when the application of electric power in the Navy was only just beginning—of fire control and similar telegraphs on board ship there was then no

trace. The new chief at once introduced parallel running of generators, raised the pressure from 100 volts to 220 volts, introduced paper-insulated cables, developed an entirely new system of distribution, and radically re-designed old fittings, besides introducing many new fittings of a very special design, and he also succeeded in getting the Admiralty contracts submitted to competitive tenders on definite specifications. His was the great responsibility of the design and supervision of contracts for the electrical equipment of all His Majesty's ships, and he has had the unique experience of having seen his designs and arrangements satisfactorily withstand the supreme test of action with the enemy. Not only has this responsibility covered the electrical equipment for all kinds of purposes of the greatest Navy in the history of the world, but since the first installations at the Admiralty Dockyards

Elliott & Fry

C. H. WORDINGHAM.

[London.]

carried out by Messrs. Preere & Cardew before the appointment of the Electrical Engineer-in-Chief, the President has been adviser to the Admiralty on all matters of power supply and lighting in all their land establishments, including the whole of the work for the great Dockyard at Rosyth and the numerous naval air stations established throughout the country. It is an appropriate year for the Institution of Electrical Engineers to place in the chair one who has done so great a work for that "sure shield"—our incomparable Navy—on which civilisation itself depends.

The President has ever been a hard worker in the interests of the Institution—the only touch of sadness being that his mother, who was such a constant and devoted companion to her son at the conversazioni and other public functions, is not here now to welcome his new dignity. He is one of the oldest members of the famous Wiring Rules

Committee, and has laboured for the Institution in many other ways. If he has served the Institution well, it may also be said he has served the industry even better. Very few people perhaps realise the enormous energy which Mr. Wordingham has put into the work of standardisation; so long ago as 1898 he read a paper on "The Necessity for Uniformity of Plant and Apparatus," and in 1902 he was invited by the late Sir William Preece to join the Engineering Standards Committee. For 15 years the President has given his best to this cause, and many British standard specifications are the visible result of the labours of the many Sub-Committees over which Mr. Wordingham presides.

The second President of the Municipal Electrical Association, now grown into the Incorporated Municipal Electrical Association, the esteem in which Mr. Wordingham is held by municipal engineers was shown by his election as one of the five Honorary Members of that Association. Chairman, also, of the Electrical Research Committee, founded under the auspices of the Advisory Council of Scientific and Industrial Research, he has embarked on a work of national importance, which will be of practical assistance to the electrical industry. Whether from his general courtesy, his invariable kindness, his wide experience in engineering, his great interest in research, and unceasing labours in the cause of British standardisation and the advance of the British electrical industry, the members will feel that they have done wisely in electing Mr. Wordingham to the highest distinction they can offer him.

THE FIXATION OF ATMOSPHERIC NITROGEN.

(Continued from page 342.)

The Schönher-Hessberger Process.—This process utilises a linear arc, the furnace containing a central iron tube, water-cooled at the top, and a movable bottom electrode, also of iron. The arc plays between the bottom electrode and the upper, water-cooled part of the top electrode. Air entering the furnace is heated to 500° C. by a jacket of hot gases; inside the central tube the temperature is 3,000° C., and that of the gases leaving the cooler and passing into the pre-heating jacket, is about 1,200° C.

This furnace is more robust than the Birkeland furnace, and does not require a magnetic field (which consumes 10 per cent. of the energy supplied to a Birkeland furnace). Nevertheless, Eyde states that the net efficiency of the Schönher-Hessberger furnace is practically equal to that of the Norwegian furnace.

In the Christiansand works, making only sodium nitrite by the action of gases at 300° C. on caustic soda, there are 12 150-kw. Schönher-Hessberger furnaces utilising A.C. at 1,200 volts, 50 cycles, and working with an arc 16 ft. in length. At Saarheim there are 96-kw. furnaces with 20-ft. arcs, the total length of the furnaces being nearly 10 ft.

The Panling Process.—Water-cooled iron electrodes, resembling a horn-type lightning arrester are mounted inside an oval chamber, through which air is blown from bottom to top. Alternating current at 6,000 volts, 50 cycles, is used, and the arc assumes a fan-shape. Furnaces ranging from 100 to 1,000-kw. rating are used at Gelsenkirchen (Westphalia). The French "Le Nitrogène" Co. uses furnaces of 600 and 1,000 kw. at Roche de Rame. Three 1,100-kw. and one 2,000-kw. furnaces are used at Nitrolée (U.S.A.); other furnaces of the same type are used at Innsbruck, Milan, Chippis, and in South Carolina; and a 15,000-kw. plant capable of producing 6,000 tons of nitric acid per annum has recently been installed at Muldenstein (Saxony).

The Naville-Guye furnace is of the same type as the Panling furnace, and yields 1,200 to 1,230 lb. of nitrogen per kw.-year. An inverted V-shaped arc is produced between horn electrodes, through which the gas stream is constricted. The Moscieki furnace, with a magnetically rotated arc, is not used extensively, but is employed in the Bodio Works of the Neubausen Co.

The Haussner Process.—Although this process has not been used on an industrially important scale, it is worth mentioning, because the high temperature requisite for direct oxidation of nitrogen in a mixture of nitrogen and oxygen is not obtained by the electric arc, but by explosion of a combustible mixture of gas and air. A mixture of town gas, air, and oxygen compressed to 45 lb. per sq. in. develops a maximum pressure of 325 lb. when exploded. The burnt gases are at once cooled by expansion to prevent decomposition of the oxidised nitrogen. The yield is equivalent to about 15 gm. of nitric acid per cubic metre of gas at the outlet of the apparatus. For the sake of cheapness, Haussner proposed to use coke oven gas instead of coal gas, but the yield per cubic metre of gas of 4,100 calories thermal value is only 170 gm., which corresponds to a much lower efficiency than is obtained in the arc processes. One wonders, however, whether there is a possible application for the Haussner process in conjunction with explosion turbines.

Direct Synthesis of Ammonia: Haber's Process.—Prof. Le Chatelier took out a patent concerning the synthetic manufacture of ammonia in 1901, but owing to a serious laboratory accident he abandoned his researches before bringing his results to an industrial basis. As subsequent events have shown, this was particularly unfortunate. The problem was again attacked by Haber in 1908, and, with the immense resources of the Badische Anilin and Soda Fabrik at his disposal, this investigator achieved a success so complete that the Germans are now producing at Oppau (near Ludwigshafen) at least 60,000 tons per annum of combined nitrogen, corresponding to 300,000 tons of ammonium sulphate. The latter is now produced at £6 per ton, where it formerly cost £16 per ton, and it is largely owing to the Haber process that Germany has been able to make fertilisers and explosives in spite of the Allies' blockade. The total cost of £6 per metric ton is due principally to the cost of materials employed; thus 476 lb. of nitrogen = 6s. 6d.; 102 lb. of hydrogen = 46s. 6d.; 1,662 lb. of sulphuric acid = 37s.; manufacturing cost = 32s.; total, £6 2s. per ton of ammonium sulphate.

The direct synthesis of ammonia from nitrogen and hydrogen, bristles with technical difficulties, both of materials and of processes, but all the difficulties have been overcome and the vital secrets are guarded effectually by the Badische works. Both hydrogen and nitrogen are now available cheaply on an industrial scale, and the Haber process, though it demands close and highly-skilled supervision, does not necessitate high temperature or very cheap electrical energy, yet it produces combined nitrogen at very low cost, and is a correspondingly serious rival to all other processes. The direct combination of nitrogen and hydrogen under stable conditions is made possible by aid of a catalyst, osmium, uranium, and various iron compounds having successively been found effective. Power required to compress the gases may be obtained cheaply from water-gas or from gas producers operating on lignite. Incidentally, it may be mentioned that electrical energy thus produced has been used extensively in Germany to make calcium cyanamide, the output of which has been increased considerably during the war.

Fixation of Nitrogen in Metallic Compounds.—Within the last quarter of a century the electric furnace has shown that the apparent inertness of nitrogen is simply a question of temperature, and that, at suitable temperatures, nitrogen is comparatively active. Even at normal temperatures, certain micro-organisms are able to fix atmospheric nitrogen, but the means whereby they do so is not yet known. The only metallic compounds of nitrogen which have yet found industrial applications are those with the carbides of alkaline earths and with aluminium.

Calcium Cyanamide, frequently (but erroneously) called simply cyanamide, is produced by the action of nitrogen on calcium carbide. Cyanamide itself, or its calcium salt, is transformed easily into urea, and so into ammonium carbonate. Cyanamide manufacture thus constitutes an indirect synthesis of ammonium carbonate. The special electric furnace used for cyanamide manufacture at the Odda works comprises a large iron cylinder with a double bottom and a detachable cover. The false bottom is perforated with holes, through which the nitrogen enters. Axially in the

furnace there is placed a long carbon pencil connected to the terminals of an alternator, and surrounded by a paper sheath. The charge of carbide, amounting possibly to 1,000 lb., is in successive layers separated by sheets of paper. When the central rod is heated by the passage of current, a temperature of 800 to 1,000° C. is attained along the axis, and nitrogen is then passed into the furnace. The action is completed in 25 to 30 hours.

In determining the electrical energy needed to fix nitrogen by the above method, it is necessary to allow for that consumed in producing calcium carbide. About 1 lb. of carbide is needed to fix 1 lb. of nitrogen, and 1 h.p.-year yields 3,300 lb. of carbide, hence 1 lb. of nitrogen requires 4/3,300 h.p.-year in respect of carbide. The energy requirements of the calcium cyanamide furnace are very low, and 1 h.p.-year is sufficient to fix at least 5,500 lb. of nitrogen, so that the total energy consumption is $(4/3,300) + (1/5,500) = 0.0014$ h.p.-year per lb. of nitrogen—i.e., 1 kw.-year fixes about 970 lb. of nitrogen. This corresponds to nearly four times the efficiency realised in arc furnaces: but the cyanamide process requires carbon (coke, anthracite, or wood charcoal), which is a compensating disadvantage in some countries.

As it leaves the furnace, the cyanamide contains barely 60 per cent. of CaCN_2 , the principal impurities being 18 per cent. of free lime and 12 per cent. of carbon. The nitrogen content is 20.5 to 21 per cent. Before the war, the principal, if not the only, use of cyanamide was as a manure, and its use will doubtless extend, although nitrates seem to be of higher manurial value. The latter varies with the conditions of test, but Gerlach gives the following figures:—

	Nitrogen content.		Relative value
	Gerlach.	Scott.	as manure.
	Per cent.	Per cent.	Gerlach.
	Per cent.	Per cent.	Per cent.
Sodium nitrate (Chile) ...	15	15½	100
Ammonium sulphate ...	21	18	89
Calcium cyanamide... ..	20–21	13	76
Calcium nitrate	13	18	99
Ammonium nitrate... ..	—	35	—
Farmyard liquid manure ...	—	—	64

When heated with water under pressure, cyanamide yields calcium carbonate and ammonia.* The yield of ammonia is 96 per cent. or more of the theoretical value, and the ammonia may be converted to sulphate (in a purer state than obtainable by distilling coal); or it may be combined with acid to yield ammonium nitrate, which, as shown by the above table, has a very high nitrogen content, and is therefore an economical form in which to transport combined nitrogen. If desired, the ammonia may be converted to nitric acid by the Ostwald catalytic process. The Haber process yields ammonia of higher purity at yet lower cost, and high purity is an important consideration in the catalytic oxidation of ammonia to nitric acid: but the Haber process is not likely entirely to supplant the cyanamide process, because the latter yields a number of nitrogenous compounds of growing importance.

The first cyanamide works date from 1909, but the world's production was 140,000 tons in 1911, 266,000 tons in 1913, and about 1 million tons at present (corresponding to 1,250,000 tons of Chile nitrate). German production (60,000 tons in 1913) is now about 400,000 tons per annum, and it is due to cyanamide and the Haber process that Germany has been able to dispense with 800,000 tons per annum of Chile nitrate, one quarter of which was used by industry and the remainder for agriculture. Early in the war the German Government placed £7,500,000 at the disposal of cyanamide works† and of the B.A.S.F.: as a result of this munificent grant, the supply of nitrates for explosives and agriculture has been assured.

The Serpek Process.—The B.A.S.F. has patented the manufacture of such compounds as TiN_3 , Si_3N_4 , but has derived no practical application therefrom. The Société des Nitrures (Paris), however, has developed the Serpek process whereby Al_2N_3 is made by heating bauxite and carbon in the presence of nitrogen. Under the action of high-pressure steam, Al_2N_3 yields pure alumina (useful in aluminium manufacture) and ammonia, which may be

regarded as a valuable by-product. The first industrial plant utilising this process consisted of two rotary-tube furnaces, in the first of which bauxite was dried, whilst in the second the dried bauxite mixed with carbon formed a resistance element between two carbon rings, and was thus heated electrically, in the presence of nitrogen. The first furnaces were of 3,000 to 5,000 kw. rating, but 500-kw. furnaces are now considered preferable. It is estimated that 1 kw.-year yields 2 tons of pure alumina and 1,100 lb. of nitrogen in the form of ammonia. The Serpek process seems to be capable of great development, and further details concerning it are given in *Génie Civil* (*loc. cit.*).

Oxidisation of Ammonia.—This is a chemical process dictated by the commercial consideration that nitrogen is worth more as nitric acid than as ammonia. Also nitric acid is a primary material in the manufacture of explosives. Ammonia and atmospheric oxygen interact to yield nitric acid when they are passed over spongy platinum. The true action is complicated, but the apparatus is simple. Various refinements have been introduced, but essentially Ostwald's apparatus is retained. Nearly 100 per cent. efficiency of conversion is obtained, the principal requirements being pure ammonia, such as is yielded by the Haber process.

(To be continued.)

MAGNETIC TESTING FOR STEEL PRODUCTS.

A NEW method of testing steel and steel articles without damaging them in any way was described recently before the American Society for Testing Materials, and is, we understand, to form the subject of a forthcoming bulletin of the Bureau of Standards. The method in question consists of simple magnetic tests, and is based upon the fact that the magnetic and mechanical properties of a certain grade of steel are definitely co-related, so that one may be taken as a criterion of the other. Mechanical tests, chemical analyses, and microscopic examinations of steel are all useful, but none of them can be applied to the actual piece or part which is to be used in service. Mechanical, chemical and microscopic tests are vicarious: they relate only to a small part (sometimes a *very* small part) of a specimen which is assumed to be representative of the service piece or pieces, and the results of such tests are frequently no more than comparative. Magnetic tests, on the other hand, can be applied to the actual pieces to be used in service, they can be applied to the whole length of a steel rail or to the working tip of a tool, and their results can be interpreted definitely, after establishing the magnetic characteristics of what is known to be a satisfactory sample, by a preliminary series of tests.

The first step in evolving magnetic tests to be applied to steel or steel products on an industrial scale is to determine magnetic data for good, bad, and indifferent samples, and thence to derive a scale of equivalence between magnetic data and whatever qualities it is desired to assess in the material under examination. The best magnetic criteria to be adopted in individual cases must be determined by trial, and apparatus must be designed to suit the work pieces handled and the tests made thereon. An important point is to arrange the tests and apparatus so that a minimum of skilled attention is required. The tests can and should be reduced to routine.

As typical of the kind of relation which it is desired to establish (naturally on a definite numerical basis in individual cases), it may be mentioned that the greater hardness and tensile strength and the reduced toughness following upon increased carbon content in steel are accompanied by increased coercive force and hysteresis and decreased permeability. Similarly, cold-drawing of carbon steel increases its tensile strength and simultaneously increases the coercivity and hysteresis, whilst reducing permeability. Heat treatment, the lapse of time ("ageing"), and previous mechanical treatment, all produce corresponding changes in the mechanical and magnetic properties of steels, and it is possible to determine, once for all, the numerical relation between these changes for each particular steel.

* Details of the process are given in *Génie Civil*, pp. 370-371.

† Bayerische Stickstoffwerke, Trostberg (Frank-Caro process); A.G. für Stickstoffdunger, Knapsack und Mitteldeutschen Stickstoffwerke, Gross Kayna (Polzenius process).

The great advantage of magnetic testing in the present connection is that it can be applied quickly (where suitable apparatus is designed for repetition tests) to actual pieces which it is intended to use—even to pieces in service (*e.g.*, bridge members, mine-shaft cables, &c.). Another advantage of magnetic testing is that it indicates variations in mechanical state, chemical composition, heat treatment, &c., whether purely local or whether in the piece as a whole. Of course, the number of variables capable of affecting the magnetic properties necessitates systematic and well-devised interpretation of the latter, but there are no serious difficulties. A simple variation-in-leakage test permits a steel rail to be tested for uniformity in one minute or so. An induction test, using some form of permeameter, then discloses unsuitable chemical composition and bad heat treatment (such as unsuitable finishing temperature or too rapid cooling). Measurements of coercive force reveal differences in quenching temperature as accurately as pyrometer readings.

Raw materials may be tested rapidly and with certainty by magnetic means. The quality of finished products may be checked in the same way, and it may be ensured that samples, whether of material or of products, are really representative. The consequences of not detecting a faulty sample until a destruction or service test is reached may be far-reaching. The possibility of testing actual service pieces without injuring them in any way permits of more economical design with a lower initial factor of safety, and the possibility of testing parts whilst in service permits them to be used until the lowest permissible factor of safety is reached. To cite only a single example, steel ropes for hoisting or winding may be kept much longer in service when a reliable means is available for observing continuously their deterioration. Individual testing of all parts or pieces permits of grading, and, by eliminating uncertainty as to quality, prevents wasteful expenditure of material and quality, and attaches higher value to the latter where really required, since it can now be guaranteed with greater certainty.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

Disconnectors and Gate-End Boxes.

MESSES. GEORGE ELLISON, of Wellhead Lane Works, Perry Barr, Birmingham, have recently introduced a line of "disconnectors" for A.C. and D.C. circuits up to 720 volts. These are intended for isolating sub-sections of works installations, branch cables and motors, during alterations or repairs, and being "isolators" only are not intended to be operated when currents are flowing. They can be bolted to walls or installed in cable trenches and manholes. Two sizes, triple-pole, for cables of 125 and 24 sq. in. section, are made; by omitting one pole a double-pole pattern is obtained.

The contacts of the two sizes will carry 125 amp. and 210 amp. with 35° F. temperature rise.

Fig. 1 shows a disconnector with the case closed; fig. 2 shows

FIG. 1. ELLISON DISCONNECTOR, CLOSED.

the switch interior removed. The arrangement consists of a circular cast-iron box built up in three sections, and provided with four flanges for radial cable fittings.

The mechanism and contacts are supported on the base casting only; the fixed contacts are round copper rods with tapered ends, while the moving contacts are brass blocks with circular recesses or chambers containing rings made of phosphor-bronze spiral springs, which the plugs force against the sides of the recesses, giving an

intimate elastic self-cleaning contact between plug and block. A cast-iron partition under the handle entirely encloses all live parts, and the whole moving system can be withdrawn from the box without the risk of accidental contact with live parts.

Fig. 3 shows another of Messrs Ellison's specialities, viz. an oil break gate-end box with trailing cable socket and plug inserted, the breaker being closed. The makers point out that instead of using long and heavy trailing cables to remote positions it is better to install plug sockets, with a protecting switch or circuit breaker at suitable intervals.

FIG. 2.—SWITCH INTERIOR REMOVED FROM BOX.

The fittings have been designed to combine an oil circuit-breaker, interlock and socket and plug in one unit, with special application as gate-end boxes for the trailing cables of coal cutters. One size of 100-amp. capacity is made in double and triple-pole patterns for use with standard oil circuit-breakers.

For the double-pole pattern, a three point socket and a plug are mounted on a dividing box bolted to a D.P. breaker, and the plug cannot be removed until the breaker is off. In the triple-pole

FIG. 3.—ELLISON OIL-BREAK GATE-END BOX.

pattern a four-point plug is used. The socket and plug cases are made in cast brass, with interiors of ebonite and gunmetal terminals; the plug is fitted with a grip to take the usual types of cable.

The cable cone clamps have substantial earthing lugs, and a terminal with shell clamp is fitted in an accessible position on the breaker. An ammeter or voltmeter, and pilot lamps, can be fitted, and the complete unit can be wall mounted or mounted on a stand as shown.

The apparatus is suitable for A.C. or D.C. circuits up to 750 volts pressure.

Stell's Cable Fault-finding Apparatus.

Finding faults in cable core at the earliest possible stage of manufacture will be admitted by makers to be a most desirable achievement. From the boy holding a wet cloth on the cable and receiving a shock when a faulty portion passed through it, to the more humane if less exciting use of a galvanometer, battery, and water bath, was not a long step, nor was the result all that could

be desired, for high-resistance faults still escaped detection, and the process could not be applied to cables at all stages of manufacture. The development of a successful "spark" method of testing, therefore, by MESSRS. NORMAN, STELL & CO., of 23, Spring Gardens Road, Heaton, Bradford, will be welcomed by the trade. We understand that the apparatus has been at work successfully for some 12 months, 10 hours or more daily, and has proved its worth; it is illustrated in fig. 4 herewith. In the makers' words, the method consists of using a high-potential and high-frequency discharge or spark to indicate a fault, the conductor of the cable being connected to one terminal or earth, while the cable itself runs through the hand-clip provided, which is connected to the H.T. terminal by means of flexible leads.

The apparatus comprises an induction coil controlled by specially arranged instruments, the energy being derived from any commercial D.C. or A.C. lighting supply, and the makers have arranged, for general work, a "Standard" apparatus fitted for four sets of fault-finding, each separately controlled; 20 ranges of regulation are provided. It is arranged for connecting to any B.C. lampholder or wall plug (two-pin), and being fitted (excepting leads and clips)

FIG. 4.—STELL'S FAULT-FINDING APPARATUS.

in a polished wood case, it is easily portable and can be used in any convenient position.

The makers claim the following advantages for their method and apparatus:—

The cables may be kept perfectly dry, so that repairs can be better and more easily made.

Cores can be examined before vulcanisation, thus obviating the separate curing of repairs.

Finished wires or cables which would be damaged by water or dampness can be easily "fault-found."

No batteries or tremblers are used, and consequently the detecting spark remains constant, thus eliminating expensive renewals.

Faults of comparatively high resistance (say, 200 megohms) are easily detected, hence the customary "breaking down" of faults—which is often damaging to the cable—is avoided.

There is no danger to the operators, provided the simple caution given with sets is observed.

The current consumption is exceedingly small, and a "short" on the primary or secondary of the coil will not cause any damage.

The wear and tear is exceedingly small.

No special skill is required to use the apparatus or keep it in working order, there being no intricate or delicate parts.

The spark, being static, does not damage the insulation as an ordinary A.C. high-tension current sometimes does.

The spark can be both seen and heard.

Finished flexibles and P.R. insulated cables can be examined for faults.

Cables and cores can be easily fault-found wet if proper precautions are taken—viz., the usual insulation of the conductor from the drum spindle and the outside of cable or core.

MESSRS. THOMPSON & CO., 48, Watling Street, E.C. 4, are the London agents for the makers.

The New C.A.V. Electric Starter.

The accompanying illustrations, fig. 5, show the initial and final positions of the pinion of the C.A.V. starter, which we described on

page 305 of our issue of September 28th. In the first position the screw thread is visible, which, when the motor is set in slow motion, with the pinion drawn into contact with the gear on the flywheel, brings the pinion fully into gear as in the second view. By using a two-position plunger, which allows the pinion to mesh with the gear wheel at a low speed, before the full power of the motor is

FIG. 5.—THE C.A.V. STARTER, DISENGAGED AND FULLY MESHED.

exerted, the sudden impulse which is applied to the flywheel by some American types of starter is avoided, and there is no danger of breaking the engine shaft. The screw also ensures with certainty the disengagement of the pinion without damage to any part of the mechanism in the case of a backfire.

We are informed that owing to the great public interest taken in the new starter and the wide publicity it has received, the firm have found it impossible to cope with all the demands for booklets, drawings &c., but inquiries are being dealt with as rapidly as possible.

THE ENGINEERING PLANT IN LARGE HOTELS.

SPEAKING on this subject at UNIVERSITY COLLEGE, LONDON, last week, at a public introductory lecture in association with the Sub-Department of Heating and Ventilating Engineering, Mr. A. H. BAKER, B.A., B.Sc., Whit.Sch., said the organisation of a large modern hotel was an affair of considerable complication. It must be prepared not only to supply the requirements of a thousand persons at all times, but at any moment for the unexpected arrival of a hundred new visitors at a time. Such an event should hardly cause any stir or confusion, but merely somewhat harder work on the part of the staff. Things were done for the individual guest to all appearance so automatically, that he never even thought of the organisation and engineering plant involved. It was the labour-saving devices which constituted the engineering equipment which enabled it to be done; it could not be done without these apparatus. The application of such apparatus on a small scale to a private house would greatly reduce the labour necessary. It must also be remembered that no part of this great mass of machinery was visible to the guests in an ordinary hotel except the lift cages and the taps. The bulky parts of the plant were all disposed of either in the sub-basement, which was one mass of machinery over almost the whole area, or at the top of the building. A large hotel was not constructed until a very great amount of thought had been expended upon it; its construction was so complicated that it would be inviting disaster to commence operations before the whole of the details had been exhaustively thought out. In the case of some large hotels in which he had been interested, every motor, fan, and other piece of machinery, every pipe and flue, had been on the plans, and the whole of the calculations had been completed even before the buildings, which were to be destroyed in order to make room for the future hotel, had been demolished. A particular example of this kind was very complicated. The hotel was practically cut in two by a railway which passed right through it; only one set of boilers was admissible, so that the supply of steam had to be carried across the railway to all parts of the building. Similarly, fresh air for ventilation could only be taken from one portion of the site, and distributed from this to every part of the building, and the same was true also of other services.

In the boiler-house and heater-room all the heat required for every service except the direct fire cooking was generated. The cost of the fuel in an hotel was a very serious item, amounting in some cases to tens of thousands of pounds per annum. It was easy to see that facility of control was one of the most important features in the design. It was necessary that it should be perfectly easy not only to know what the requirements at any given time were, but to adjust them according to requirements with very little trouble. It was, therefore, in the first place desirable to provide that all such operations could be carried out from one point in the hotel.

In the buildings for which he had been responsible this had been arranged to be done from one centre which he had termed the "control room," in which were concentrated electrical and mechanical appliances for enabling the control to be exercised at distant points without the engineer-in-charge leaving the control room. One of the principal difficulties in arranging all the mass of machinery in an hotel was to provide against noise, particularly in a modern hotel constructed of steel girders and concrete, which transmitted noises from the basement to the upper floors with great ease. The noisier machines had to be placed outside the buildings. It was necessary in all cases to bed the motors on sound-absorbing foundations, such as cork, or felt, or hair mattresses. Many of the operations necessary in a modern hotel continued throughout the night, and in one of the big areas or courtyards of an hotel, surrounded on all sides by bedroom windows, most of which were open, the least noise was apt to be magnified in the stillness of the night, and to become a ground for complaint.

WAR ITEMS.

Exports to China.—The "London Gazette" for October 16th contains further names of persons in China and Siam to whom exports may be consigned.

Belgian Reconstruction.—It is stated that M. Paul Hymans, the Belgian Minister, has been called upon by his Government to take up the direction of a new Ministerial Department specially entrusted with all questions concerning the economic reconstruction and the commercial policy of Belgium.

Trading with the Enemy.—The "London Gazette" for October 12th contains further lists of persons and bodies with whom trading is prohibited in the following countries:—Argentina, Paraguay, Uruguay, Bolivia, Chile, Netherlands, Netherlands East Indies, Norway, Peru, Spain, Sweden, and Venezuela. Variations in and removals from previous lists are also given.

Raw Materials After the War.—Dr. Addison, the Minister of Reconstruction, after consultation with the other Government Departments concerned, has appointed a Committee to consider and report upon questions connected with the supplies of raw materials which will be required by British industries for the purpose of restoring and developing trade after the termination of the war, and the best means of securing and distributing supplies, due regard being had to the interests of the Allies. The Committee is requested, in regard to any commodities which might not be available in sufficient quantities and at reasonable prices through the ordinary commercial channels, to consult members of the trades concerned with regard to any steps that may be necessary to safeguard the needs of industry, and to secure convenient and equitable distribution. The Committee, which will be known as the Central Committee on Supplies of Materials, consists of the following:—Sir Clarendon Hyde (chairman), Sir Henry Birchenough, K.C.M.G., Mr. Cecil Budd, Sir Charles W. Fielding, K.B.E., Sir H. Babington Smith, K.C.B., Mr. Wallace Thornycroft, and Mr. Andrew Weir. The Secretary is Mr. J. F. Ronea (Board of Trade), communications to whom should be addressed at the Ministry of Reconstruction, 2, Queen Anne's Gate Buildings, Westminster, S.W. 1.

Commerce and Demobilisation.—According to the *Financier*, the Council of the London Chamber of Commerce has referred the question of reconstruction affecting industry and trade to the trade sections concerned, with a view to the formulation of a definite policy in the interests of manufacturers and merchants. It has referred to a special committee to report as to the desirability of the early release from military service, after the war, of men in commercial occupations, including principals, partners, clerks, and technical experts, whose places have been kept open for them or whose services will be urgently required after the war. Arrangements were also agreed upon for a public meeting of merchants and others on the question of Government control of trade.

Recruiting in Munitions Areas.—Defence of the Realm Regulation 11AA, which came into effect on August 8th, 1917, requires employers to whom it applies to notify the Munitions Area Recruiting Officer within 48 hours when a man enters or leaves their employment who holds a certificate issued by any Munitions Area Recruiting Officer. This Regulation has been made in order to secure that the records in the Recruiting Register of men who hold certificates protecting them from recruitment because they are engaged on Admiralty, War Office, or munitions work, are kept up to date. The Scheduled Occupation Certificates and the Protection Certificates issued under the Schedule of Protected Occupations are only valid so long as the holder is engaged on Admiralty, War Office, or munitions work, though, as explained below, men will not forfeit protection from recruitment merely because they are moving from one firm engaged on such work to another. It is necessary in the interests of all concerned in the output of ships and munitions of war,

and in recruitment for the Army that the value of these certificates should not be impaired through their retention by men who have ceased to be entitled to hold them. It is not intended that this Regulation should in any way interfere with the individual workmen's freedom to change his employment, which is restored now that the abolition of leaving certificates under the Munitions of War Amendment Act, 1917, takes effect. On the other hand, it is not reasonable that protection from recruitment, which is given solely on the ground that a man is more usefully employed on necessary war work than he would be in the Army, should be abused by protracted absence from work. Accordingly instructions have been given to Munitions Area Recruiting Officers that after 14 days from the date of leaving they should call up any man who has left his employment, if by that date no notification has been received of his re-employment on work which entitles him to continued protection. In view of the urgent demand for labour of the kind protected under the Schedule, it is considered that a fortnight is ample time to allow for workmen to obtain fresh employment. If by the end of 14 days a man is still not employed on work entitling him to protection, he becomes liable to recruitment, unless he can prove to the Enlistment Complaints Committee that his failure to obtain work was due to sickness or to a definite cause entirely beyond his control, such as the temporary closing of a shop where he has secured employment. The period of 14 days runs from the date when the workman actually leaves his employment, whether he leaves on the week's notice or termination of employment provided for under the Munitions of War Amendment Act, 1917, Section 3 (1), or otherwise. It is the duty of any man holding a Scheduled Occupation Certificate, Army Form W.3476A, who changes his employment or his address, to take or send his certificate to the nearest Recruiting Office, in order that the change may be duly recorded in the Military Register.

Exemption Applications.—At Rochdale, temporary exemption to February 28th was given to F. Walton, 29, married, an overhead linesman in the Corporation tramways department. He was now C.2, formerly Class A, and Mr. G. Webster, the manager, said the man had been discharged from the Army.

At St. Annes-on-Sea, when two motormen, each C.2, were exempted to the end of March, it was stated by Mr. H. W. Laing, manager of the Blackpool, St. Annes & Lytham Tramway Co., that some 160 men in the company's service had joined the Forces, and there were now only eight of the original staff left.

At the West Riding Appeal Tribunal, a Leeds tramdriver, aged 42, Class A, who pleaded domestic hardship owing to the illness of his wife, said he was also in a certified occupation. He had been a driver continuously for 14 years, but it was said the Corporation were prepared to release him. Discharged soldiers were being substituted. The appeal was dismissed, applicant to report in a month.

At the same Tribunal, the storekeeper of a Leeds cable company, aged 39 and Class C.1, said that his firm were doing Government work, and he was better employed than in the Army. The case was dismissed.

At Farsley, Norman Hill (29), C.3, secretary of the Morley Electrical Engineering Co., had his exemption extended till December 31st.

At the same Tribunal, C. W. Broadbent (32, C.1), fitter; E. B. Wheatley (36), tool fitter; and F. Strickland, ripping machinist, all employed by the Phoenix Dynamo Co., Ltd., Bradford, were informed that, being in possession of trade cards, there was no further need for them to appeal, but should the cards be withdrawn they must lodge appeals within seven days, or otherwise they would be soldiers.

Before the Herts. Appeal Court, exemption was sought by M. J. Connari (38, B.2), electrician, Watford. The Military Representative said that it had been decided twice by the Local Tribunal and once by the County Appeal Court that appellant had no claim on business grounds. The Court heard the claim on the one-man business plea, but dismissed it, with grace until November 15th.

At Reading, an appeal was made by J. H. Ferguson (36, C.3), director and secretary of the Whitechurch and Pangbourne Electric Supply Co., Ltd., and said to be practically the only person now running the concern. Sir Cameron Gill, for the Military, claimed appellant as being useful for the Army Pay Corps. Three months were conceded.

Before the Horsham Rural Tribunal, exemption was claimed for the man in charge of the electric lighting plant on the Lower Beeding Estate (30, B.2). The man desires to join up, and time in which to find a substitute was asked for. The Tribunal suspended the calling up for five weeks.

Maidstone Tribunal has granted six months' conditional exemption to H. Clement (37, C.3), electrical engineer at the Allington pumping station.

Dover Tribunal has granted a further three months' exemption to A. E. Overs (33, C.1), electrician at the King's Hall.

On the appeal of Messrs. J. Walsh Ltd., exemption until April 11th has been granted at Sheffield to L. Fryer (B.1), electrical engineer.

A month's exemption has been allowed to T. W. Johnson, electrical engineer at the Stansted (Essex) sewage works.

On the appeal of the City Council, the Chester Tribunal has granted four months' exemption to the tramways super-

intendent, and conditional exemption to a driver (C 2) and a coachbuilder (41, B 1).

An electrical engineer and contractor (31, B 1), who appealed at Newcastle-under-Lyme, has been given exemption until the end of the year.

At Rochdale, exemption was claimed by W. Pickard (30, B 2), electrical engineer, previously rejected, and now engaged in making experiments. He was given until January 31st.

At Swinton and Pendlebury, Messrs. Ermin & Roby appealed for their electrical engineer (38), and temporary exemption until December 31st was granted.

Brighton Tribunal has granted three months' exemption to an electrical contractor (29, C 3).

At Leicester, appeals were made by two partners in a firm of electrical engineers, one in C 1 and the other in C 3. It was stated that the firm's turnover was £4,000 per annum, and that they were doing a great amount of work for local engineering firms. The C 3 appellant was allowed four months' exemption, and the other appeal was adjourned.

The East Kent Appeal Tribunal has allowed a Military appeal against the refusal of the Broadstairs Tribunal to withdraw conditional exemption held by the chief store-keeper of electrical plant in the employ of the Isle of Thanet Tramway Co. The man is not to be called up before January 8th.

An appeal was made at Maidstone for J. H. Baxter (31, passed for general service), electrician at the mills of Messrs. Reed, Tovil. The firm was willing to accept a substitute, and exemption was granted until a suitable one is found.

On the appeal of the Electric Tramways Co., the Oxford Tribunal has granted three months' temporary exemption to A. W. Oakley (37, C 3), blacksmith's fitter.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Curiosities of Early Mains Work.

In your issue of September 28th I read with considerable interest the article by Mr. G. W. Stubbings under the above heading. In it, he refers to "a system of distribution recently proposed in which the live main is looped into each consumer's premises in order that one distributor may be sectionised." I presume that the system he mentions is Patent No. 12,664/15, by Messrs. Callenders & Frampton. If this is the case, I think he cannot have given the system very careful consideration. His sole objection to it seems to be on the score of expense, and he quotes, as an example, the cost of a service 20 yards long. In the first place, in most provincial towns where distributors are laid on both sides of the streets, a consumer's cut-outs are very rarely 20, or even 10, yards from the main. Then, it is not proposed, I believe, to install a sectionising device in every consumer's premises; it would obviously be absurd to install one in a main street where practically every shop is connected; but to have two or three in each street would simplify fault localisation considerably, and what is of greater importance, would admit of the majority of the consumers' supplies being got on almost immediately (I am referring, of course, to a street being fed from both ends). These sectionising devices, moreover, would act as disconnecting boxes, thereby saving the cost of boxes, bush chambers, path frames, and covers, &c. The only expense entailed is in the cable, and this can be ordinary three-core with a small middle wire (in a three-wire D.C. supply), and two cores the same size as the main. The cut-out need only be a very simple affair, and can be made by anybody from odds and ends which are always lying about in the works. The extra labour is almost negligible. The system is quite capable of obviating a tremendous lot of mains trouble, and if Mr. Stubbings goes carefully into it I think he will admit that any slight extra cost is very easily balanced by the ease and simplicity of localising the fault and re-establishing the supply.

The Prospects of the Central-Station Engineer.

In your footnote to the letter of "Staff Electrician," in your copy of September 28th, you say:—"Under existing circumstances we cannot recommend young men of ability and ambition to join the staffs of power stations, unless it be for the purpose of acquiring a first-hand knowledge of the organisation and working conditions of such stations as part of their technical training, and not as a career."

Now, Sirs, if your advice is to be taken at its face value, it discloses a most serious and lamentable state of affairs—or, should I say, state of mind?

The generation, distribution, and utilisation of electricity, you will admit, is of some importance in the national life,

even at this date, and yet it is but on the threshold of its fuller development and possibilities.

"Existing circumstances," admittedly, are not all that are desirable. They are the result of lack of foresight and imagination in the early days, of the English genius for muddle, and of selfishness. That is in the past.

Are existing circumstances to become permanent? They can't. They must improve or deteriorate. Surely there must be something better to look forward to and to work for?

But a way to help forward is not to advise young men of ability and other desirable characteristics to shun us. It appears to me that this advice savours of rank disloyalty to those of ability and ambition already in the profession, whose ambition is not alone of the personal variety, but who have the fuller development of their chosen work in life ever before them; and there are such men, I beg to inform you.

Young men of ability and ambition are sorely wanted; never so much before as at this time—would you assert that an influx of "duds" is desirable, or is calculated to fit the profession to face the immense possibilities opening out before it?

Come, Sirs! Not a small percentage of your readers are numbered amongst us in the central-station side of the profession, and we look for an exhibition of truer logic on your part than is revealed in your advice as above set out. Admit that your criminal pessimism was an after-effect of some Hunnish raid!

John A. Vice.

Manchester, October 11th, 1917.

[Our correspondent writes an able and interesting letter, with much of which we agree. The subject is one on which a volume could be written, and, therefore, it is difficult in the space available to discuss it adequately; but it is necessary to make our position clear, and to disabuse the minds of Mr. Vice and his central-station colleagues with regard to our loyalty to their profession—though, in view of the efforts we have made during many years to improve their salaries and status, this should be a superfluous task! We fully realise the increasing importance of electricity supply, and are doing all that we can to accelerate its reorganisation on more efficient and economical lines; there will in the future be some very desirable appointments to be filled in this branch of the industry, and many more that can be described as comfortable. It is true in this calling, as in others, that there is always room at the top. But there is vastly more room in the lower grades of employment, in which the salaries are low, the work is monotonous and unvarying, the duties involve attendance seven days a week, and the prospects of advancement are poor. For proof of these facts, though he must be aware of them, we refer our correspondent to the articles on "Wages and Holidays in Central Stations" in our issue of February 28th, 1913; "Salaries in Municipal Undertakings," April 11th, 1913; "The Position of the Shift Engineer after the War," January 12th, 1917, and the letter of "Ex-Shift" in the following issue; and "Staff Organisation in Electricity Supply Undertakings," July 13th, 1917. These articles represent the "existing circumstances" to which we explicitly referred, and which our correspondent admits are "not all that is desirable"—a mild expression. He says: "That is in the past." Unfortunately, it is also in the present, and that is the reason why we cannot recommend any young man of ability and ambition to enter a power station with the intention of remaining in the business.

We fervently hope that the conditions will be changed in the future. We do not find fault with the able men who are engaged in electricity supply, nor do we reflect upon them in any way; but we sympathise with them as, in the main, a class of men who render valuable services to the community under conditions of work and remuneration which are a disgrace to the country.—EDS. ELEC. REV.]

The E.T.U. and the A.E.S.E.

I observe in Friday's, October 13th, issue that your correspondent, signing himself "Shift Engineer," states that there is no organisation in the provinces for dealing with shift engineers. I would point out that this Society has over 160 branches throughout Great Britain and Ireland, and seven special station engineers' branches, all of which cater for this and all station electrical grades. I shall be glad to supply him with full particulars, or he can obtain them direct by writing to our general office at 137, Great Clowes Street, Manchester.

H. H. Morton,

Secretary, Electrical Trades Union,

London Station Engineers, No. 1 Branch.

London, October 13th, 1917.

Anonymous advocacy carries no conviction, and adds no weight to discussions; we may therefore direct ourselves to the only signed letter on this topic in the columns of the last issue of your journal.

Ruling out the advertising matter in that letter, the remainder stands as an indictment of A.E.S.E. inactivity. This entirely misses the mark, and it would be well if your interested readers realised the following facts:—

This movement amongst station engineers does not arise

out of "A.E.S.E. tactics," but out of "E.T.U. tactics," and has been independent of any organisation.

The pioneers of the A.E.S.E. were central-station engineers, and its present constitution is that of central-station engineers.

Logical sequence: Individual aims merged in the common desire for a body representative of central-station engineers, which is now the A.E.S.E.

That is the only fact that matters, and all discussion surrounding A.E.S.E. inactivity and its past, or E.T.U. activity and its future, is superficial and futile.

The term "democratic" creeps into Mr. Barnes's letter. As a trade unionist he should be amongst the first to recognise that democracy clearly defines the right of every section to voice its own opinions. To assert that "an effective organisation will not tolerate interference" is hardly a democratic utterance!

Instructions to Meter Readers.

I have been much interested in your article on "Meter Reading"; throughout, one could see it was from the pen of a practical man. I should like, however, to take exception to the statement of Mr. G. W. Stubbings, who thinks the average man would advise a consumer that his meter was 200 per cent. fast. I should like to ask G.W.S. if he has ever considered it worth while to spend a few minutes with his meter-readers, and give them advice, as these men need training just as much as the men in any other department.

I have known a chief to meet the meter-readers in at night, inquire as to the number read, and talk about the difficulties in a practical way, and advise them generally. The result was that the men saw the importance of the job, it led to a better understanding, and afterwards they tried to carry out as far as possible the engineer's wishes. I can only recall one such interview, but everybody benefited by it. I agree with G.W.S. that meter reading has to be done quickly, and any inspection of apparatus, to be of any value, would be better left to an inspector proper.

A.B., *Meter Inspector.*

October 15th, 1917.

The Association Movement.

Your leading article of the 5th inst. and Mr. Berry's contribution of the 12th serve to focus attention on a subject which is destined to receive even more consideration in the near future.

I hope you will prevail upon Mr. Berry to develop in a later article the plans to which he refers in his concluding paragraphs.

We are all in his debt for his earlier efforts, of which he has given such an interesting account, and his further advice cannot fail to interest many of your readers.

Has he despaired of the Federation of British Industries ever becoming a true federation of associations of the type his instinct rightly leads him to desire?

O. N. Looker.

LEGAL.

A DUNDALK PROSECUTION.

AT Dundalk Quarter Sessions, before Judge Green, Dominico Mezza, an ice-cream merchant, was found "not guilty" on a charge of fraudulent abstraction of electricity belonging to Dundalk Urban Council. Mr. P. A. SPALDING, the Council's electricity engineer, gave evidence in support of the contention that current was being used without going through the meter. To the Judge, witness said he could not state the method used to prevent the current being registered; he could only give the results. He was sure, however, that "a man in the street" could not adopt this method. His Honour told the jury that there was no evidence that Mezza had tampered with the meter or the wires, adding that it was often difficult to trace electrical defects. The verdict mentioned above was returned on the Judge's advice.

WORKMEN'S COMPENSATION CASES.

AT Preston County Court, William Greer, a skilled labourer, claimed compensation under the Workmen's Compensation Act from Messrs. Dick, Kerr & Co., Ltd., Preston. The applicant's case was that as the result of an accident whilst starting an electrical machine he developed facial paralysis, which affected his right eye and the right side of his face. The respondents' contention was that the man was suffering from an hysterical affection, and that work, instead of being harmful, might help him. His Honour Judge STURGES, K.C., found for the respondents, but gave no costs.

At Preston County Court on October 9th, James Berry, electrical engineer, of Woodcock's Court, Preston, asked for a review of the compensation agreement, with Thomas Cross, electrician, Ferny-

haigh, Preston. The respondent, it was stated, was injured on June 23rd, 1914, by his hand coming into contact with a live wire, charged with a current at 220 volts. As a result of the shock neurasthenia was brought on, and by agreement a sum of £1 a week was paid to him.

The medical evidence given by Dr. Collinson, and Dr. House, Liverpool, was that the respondent was in fair physical condition, and that light outdoor work would be of benefit to him, whilst brooding over his condition was likely to make it worse.

On respondent's behalf, Dr. Mooney and Dr. Warrington, Liverpool, said the man's condition was still so serious that he was unfit for any kind of work.

Respondent, describing the accident, said the amperage was very great as his body was "dead earthed." He was held until the wires melted, probably for a couple of minutes, and was unconscious for four hours afterwards. He still suffered from dizziness, falling in the street, confusion in traffic, and, occasionally, loss of memory. Gardening caused pains in the head, and when he tried to cycle he fell off through dizziness.

Judge HUGH STURGES, K.C., with whom sat Dr. Irvin Sellers as medical referee, remarked that the respondent was what might be termed an "odd lot" in the labour market, and he was not satisfied that the man was capable of doing light work, or that he could obtain such work in the open market. He gave an award for respondent, with costs.

In the Bow County Court, before his Honour Judge Graham, K.C., sitting with Dr. Bate as medical referee, Rosetta Ellen Cooper, of Plaistow, asked for an award, under the Workmen's Compensation Act, against the Western Electric Co., Ltd., of North Woolwich. It appeared that the applicant was employed on a fuse screwing machine, and in the course of using it she had to work a clutch which threw a band on to a wheel to start the machine. This clutch was very stiff, and one day in June of last year, as she went to "strike on," she felt a pain in her inside, and felt sure she must have hurt herself. She became so ill that finally she had to be operated upon in the hospital. In June of this year the respondents offered her light work and declined to pay her any more compensation, this action being the result. Medical evidence was given to the effect that she was quite capable of light work in June, and the Medical Referee advised the Judge to enter judgment for the respondents, with costs.

According to a Cape newspaper just to hand, judgment was recently delivered by Sir John Kotze in the Supreme Court in the appeal of Elias Jacobs v. The Cape Town Corporation.

The appellant, who was employed by the Corporation, was injured whilst repairing some electric wires. The accident happened on March 23rd, 1916, and on September 5th Jacobs claimed £150 under the Workmen's Compensation Act. The magistrate granted a provisional order for half-wages at the rate of 15s. 6d. a week, with costs, and this amount the Corporation continued to pay until March 23rd last, when they ceased doing so. On April 30th the appellant served notice on the respondents claiming £117 as half of three years' wages, less £39 paid since the date of the injury. To this the Corporation pleaded in bar that a period of 12 months had expired without Elias having taken any further steps to reopen the matter and pursue his claim for compensation for permanent partial incapacity. This was upheld by the magistrate, who dismissed the application with costs. From this decision Elias appealed.

His LORDSHIP remarked that the magistrate based his ruling upon Sec. 20 of the Act, which, if correct, meant that the applicant lost his right to further compensation. The liability of an employer to make periodical payments under a provisional order granted by a magistrate might stop at the expiration of 12 months from the date of the accident, but that did not in any way establish that the right to apply for a fixed sum by way of compensation had lapsed by the effluxion of time. The Court could not, through a forced construction or strained inference, deprive a person of a right given him by the Act. The appeal would be allowed, with costs, the judgment in the Court below on the plea in bar set aside, and the magistrate directed to hear the application on its merits.

HOLT v. A.E.G. ELECTRICAL CO., LTD.

IN the Chancery Division of the High Courts, on Tuesday, Mr. Justice Younger was asked, on behalf of the plaintiff, to adjourn this action generally, with liberty to restore.

MR. GALBRAITH said the plaintiff, who was the central witness, was serving at the Front. The action was on an agreement of service, for a declaration that the defendant company was bound by the agreement, and for damages.

MR. C. J. CONWAY, for defendants, said the entire claim rested upon written documents, and the defence was that certain letters were not binding upon the company, and that they were *ultra vires*. If this defence failed, the amount due could be easily found. The defendants said the consent of the Board of Trade had not been obtained, the company being in the hands of a controller. On this point they were anxious to get his Lordship's decision, as there were other cases depending upon it. The case could be heard in the plaintiff's absence without injustice to him.

MR. GALBRAITH said the case was started in the Manchester District Registry, and the plaintiff was a material witness. Plaintiff was employed as the commercial manager of the company at their head office in London, and was now a private in the British Army in France. The agreements were traversed, and it was alleged there was no consideration for them.

MR. CONWAY said, for the purpose of coming to trial early, he thought he could waive the question of no consideration.

His LORDSHIP said, subject to the question of no consideration being waived, the case would take its ordinary course, when, if it was found necessary to have the plaintiff present, there could be an adjournment. The case, however, could not come on before Monday week.

WIRELESS ENGINEER'S ACTION.

BEFORE Mr. Justice Lush, in the King's Bench Division, on Monday, MR. WHITEHEAD mentioned the case of Elwell against the Universal Radio Syndicate, Ltd., of which, he said, plaintiff's counter-claim was outstanding. Plaintiff applied, as defendant, that the case should stand over till the next sittings. Plaintiff was a distinguished engineer and wireless expert, and the substance of the counter-claim was as to certain contracts he entered into with the British Admiralty and the French Government. The question was whether these were really fraudulent contracts in the sense that they ought to have been entered into with the defendants. The Universal Radio Syndicate was a wireless telegraphic company, in whose employment the plaintiff formerly was. The firm had admitted liability to plaintiff, and had paid money into Court.

MR. HOGG, K.C., said the case for the syndicate would be that the plaintiff whilst in their employ, without their knowledge, got contracts for his own benefit and put the money in his own pocket.

MR. WHITEHEAD said Mr. Elwell was, of course, a material witness. He had a letter from the Ministry of French Marine, in which it was stated that he was indispensable in France at the moment. He was engaged in constructing wireless apparatus and wireless stations. Some inventions of his own were being employed.

MR. HOGG : That there should be some postponement, I think, is clear. But the first application was made on May 7th. It was sworn on May 11th that it was impossible for him to leave France under the contract with the French Government, and the case was ordered to stand out till July 2nd. On June 24th another application was made, again supported by affidavit by Elwell, who then swore that he had a contract with the Italian Government, which would require him to be in Italy for a considerable time. Now an affidavit by a solicitor's clerk stated that he was engaged with the French authorities, and they were told that the Inspector-General charged with work of naval construction certified that the presence of Elwell was indispensable upon the works. He suggested that the matter stand over for a month.

His LORDSHIP said he thought Mr. Elwell should make application to the authorities in France for leave to come over any time the authorities chose to fix.

MR. HOGG said his company desired to be wound up, and wanted its money paid out of Court if it was entitled to it.

MR. JUSTICE LUSH said his Order would be as he had indicated, and the costs of the application would go to the syndicate.

BUSINESS NOTES.

Dissolutions and Liquidations.—**BRITISH CONTINENTAL ELECTRICITY CO., LTD.**—This company is winding up voluntarily, with Mr. C. E. Barker, 21, Finsbury Pavement, E.C. 2, as liquidator.

UNIVERSAL TELEPHONE AND ELECTRICAL CO., LTD.—A meeting is called for November 13th, at 6, Old Jewry, E.C. 2, to hear an account of the winding up from the liquidator, Mr. J. E. Percival.

SCHALL & SCHALL, electrical engineers, 71-75, Cavendish Street, London.—Mr. Karl Friedrich Schall has retired from the partnership. Mr. W. E. Schall will attend to debts, &c., and will alone carry on the business as Schall & Son.

AKROYD & MARSLAND, tool and gange manufacturers, Halifax.—Messrs. F. F. Ackroyd & J. Marsland have dissolved partnership. Mr. Marsland attends to debts, &c.

Developments in Japan.—The British Vice-Consul at Tokio, in a recent report on the formation of new industrial enterprises in Japan since the outbreak of war, states that the chemical industry takes first place in recent developments. In metals, metal goods, machinery and textiles there have been great developments. In regard to electrical supplies and accessories, during the period reviewed by the Consul, six Japanese companies have been organised for the manufacture of electrical supplies and accessories, such as electric motors, dynamos, switches, lamp bulbs, carbon electrodes, carbon brushes, &c. An improved process for the manufacture of micanite has enabled a Japanese company to turn out insulators, both for the home and the export trade. The total combined capital of the six companies referred to amounts to 4,530,000 yen, and they operate 11 factories.

A Westinghouse Works Committee.—There has been formed at the works of the **BRITISH WESTINGHOUSE CO., LTD.**, at Trafford Park, a Works Committee, representing both the firm and the employes, which deals with a variety of matters affecting the welfare of the workpeople. The Committee consists of 14 members in all, one from each section of the works, and two representing the firm, and meetings are held each Monday afternoon. Questions of ventilation, provision of tea canteens, purchasing overalls at cost price, securing cheap tickets for workmen to travel home, suggestions for improved time-keeping, and for improved methods of

production have all been dealt with, and both the firm and the employes—the latter numbering some 8,000—are well satisfied with the success of the experiment to date. The most striking feature of the Committee's work has been in settling the many little differences which arise from time to time in a works of such a large size.

Trading Arrangements with Italy.—In an article on "Importation (under Licence) of Italian Goods into the United Kingdom," the latest issue of the *Journal of the Italian Chamber of Commerce in London* makes the following comment:—"This preferential treatment of the French export trade has caused a great sensation in Italy, and has already aroused a feeling of intense bitterness throughout the Italian commercial world. At the time of going to press negotiations are proceeding between the Italian and British Governments, and it has already been announced that the free importation of silk goods, which was first granted to France, has been extended to Italy and other Allied countries. We hope that the British authorities will recognise that the concessions granted to France should be extended, in their entirety, to Italy, because any difference in treatment, besides being unjustified, might endanger the future economic relations between Great Britain and Italy. The present unfavourable condition of the Italian export trade, a proof of which is furnished by the extremely high rate of exchange, and the adverse balance of the foreign trade, is such as to justify the most sympathetic and liberal treatment at the hands of the British Government, and the extension to Italian trade of the same privileges granted to the French trade. Such a decision would dispel the apprehension caused in Italy as to the possibility of future inequalities of treatment in regard to the economic policy of Great Britain towards the Allies, particularly on the subject of Customs duties."

Scarcity of Electrical Goods in South Africa.—The *South African Mining Journal* for September says:—"Materials are getting very scarce in Johannesburg, and such things as key-holders at 7s. 6d., as compared with 1s. 3d. in pre-war days, are practically unobtainable. Switches have sharply advanced to 42s., being a rise of 15s., and very few only are available at that. Wiring is so scarce in some towns on the reef that one is told to supply his own wire to couple up with the main. Inquiries are active for all electrical material, but business is slow through the acute shortage of materials. Jobbing work and contracts are still taken with a general understanding that approved substitutes can be used. All kinds of electrical cable material are very difficult to obtain, and then it is a matter of negotiation as regards the price. Lamps are being absorbed through wear and tear much faster than supplies arrive for replenishment. Relief is expected from America, and, maybe, from the United Kingdom, as the tension there has been taken off somewhat since America entered the war. And now it would seem that it is more a question of shipping facilities rather than supplies if one is willing to pay the higher values ruling in England. The local demand for motors has fallen off since the Municipality cannot supply new electrical power. The contractors complain that work is anything but abundant, since almost all new work in the shape of extensions has been stopped; of course, in a place like Johannesburg there is always a lot of jobbing work and repairs to be done. Hence, as the staffs have been depleted through the recruiting, the various shops seem quite well employed. The general cry is that we could do more if we could only get the materials."

Book Notices.—*The Trade Apprentice* is the title of a magazine inaugurated at "The British Westinghouse" with the idea of bringing together the apprentices who, owing to the large size of the works in which they are employed, saw little of each other. We understand that in this respect it has been extremely successful. It is edited by Mr. J. C. Prescott, and run by the members of the company's Trade Apprentice School; as it has now reached No. 9 issue, Vol. II, it is evidently well established. Mr. H. A. Carney was the first editor, but was recently obliged to resign the post owing to pressure on his time, and the issue before us contains a cordially appreciative acknowledgment of his pioneer labours, as well as technical articles, a biographical sketch of Michael Faraday, and a humorous account of the T.A.A. sports, as well as other items of local interest, including an entertaining tale of the Ship Canal (described as a "poem"), on the lines of the "Wreck of the Hesperus."

The M. and C. Apprentices' Magazine, the quarterly journal of the apprentices employed at the works of Messrs. Mavor & Coulson, Ltd., for October, has also come to hand. This is now quite a bulky production, and a double number is foreshadowed for the Christmas issue. We note that it appeals not only to the apprentices, to whose enterprise it owes its origin, but also to every grade of employé. A description is given of the recreation camp organised by the firm on the shore of Bardowie Loch, an admirable innovation which deserves the attention of all employers; the remainder of the contents presents a remarkable variety of subjects, ranging from items about shell manufacture to articles on geology, model making, and "penny dreadfuls." The producers are to be congratulated on their success.

Faraday House Journal for the Michaelmas Term contains numerous notes on past and present Faradians, articles on insulation testing and other technical matters, and further additions to the lengthy Roll of Honour of the Institution.

Trade Announcement.—**MESSRS. E. T. PEARSON & CO., LTD.**, of 49 and 50, Watling Street, London, E.C. 1, have acquired the rights for France and the French Colonies of the Wild-Barfield process for hardening steel gauges, tools, &c., recently described in our pages.

Electric Furnaces in France.—La Société d'Applications des Fours Electriques is the name of a new company which has lately been formed in Lyons, with a capital of £20,000, to develop the use of electric furnaces.

Catalogue.—MESSRS. PASS & SEYMOUR (INC.), New York. Eighty-page catalogue of P. & S. handy electric wiring devices.

LIGHTING AND POWER NOTES.

Accrington.—The local Trades Council recently asked the B. of T. to institute an inquiry into the working of the Corporation electricity undertaking. The B. of T., in reply, points out that the undertaking is included in a large scheme for the inter-connection of electricity undertakings in Lancashire, and states that the Committee which has the matter in hand is of opinion that the scheme will result in the general efficiency of the undertakings concerned.

Argentina.—The question of the electric lighting in the city of Tucumán has been arranged. The company has agreed to take a bill of exchange for \$100,000 m/n. guaranteed by the Provincial Government, in part payment of the amount owing to it.

A company has recently been constituted under the name of "La Electrica," the main object of which is to operate electrical power stations. The capital is \$100,000 m/n. divided into 1,000 shares of \$100 each. The board consists of the following gentlemen:—President, Enrique Piccaluga; vice-president, Osvaldo Rigamonte; director, Francisco Varela; alternates, Angel Di Benedetto and Oscar Mele; syndic, Santiago G. Rossi; syndic-substitute, Enrique Bonavia.—*Review of the River Plate.*

Barnsley.—The Electricity and Lighting Committee has authorised a report showing the whole of the work necessary to put the plant in an efficient state, together with an estimate of the cost.

PRICE INCREASE.—The T.C. has decided to increase the charges for electricity by 3d. per unit for lighting and 15 per cent. for power, as from October 1st, 1917.

Barrow.—**LOAN SANCTION.**—The L.G.B. has sanctioned loans of £10,575 for boiler, foundations, steam pipes, &c., and sub-station plant and switchgear, and £5,325 for mains for electricity extensions. The Council has decided that in the future applications for supplies of electricity for premises within 30 yards of any existing distributing main only will be accepted.

Birkenhead.—**WAGES.**—A strike at the electricity generating station has been settled by the Committee giving the men an advance of 1d. per hour, as demanded. The men refused to accept the Arbitrator's award made recently, but the Committee, considering that the award was binding, did not accede to the request for a larger advance. The Chief Industrial Commissioner pointed out that, although the award could not be varied, there was nothing to prevent the parties concerned further considering the matter, with the result that the Committee reopened the question.

Birmingham.—**WAGES.**—The City Council has approved of a further war wage advance of 3s. per week for the manual employés of the Corporation of 18 years and upwards, and 1s. 6d. to those under that age, the increase to take effect as from August 1st. The estimated cost of the proposed advance through-out the Corporation service is £66,580 per annum.

Blackpool.—**WAGES.**—The municipal employés recently asked for the war bonus of 7s. to be increased to 10s.; the Corporation offered 9s. instead, or to submit the matter to arbitration. The employés chose the latter, and the arbitrators have awarded a total bonus of 12s. for men and 9s. for women. The town clerk has been instructed to write to the Committee on Production, pointing out that the award is contrary to the terms of reference, as the amount awarded is in excess of that demanded. In the meantime, workers in the gas and electricity departments have put in a claim for 15s. a week war bonus, on the ground that they are in a certified occupation.

Bradford.—**PRICE REVISION.**—On the Electricity Committee submitting for approval the proposed revised and advanced charges for current (previously published in the ELECTRICAL REVIEW) to the T.C., Mr. J. F. Waugh moved that the minutes be referred back, and said bulk consumers were already supplied cheaply, and he objected to their receiving preferential treatment as compared with the 1d. flat-rate consumers. Charges to bulk users at Bristol and Birmingham had been advanced, but the result feared by the Bradford Committee had not occurred in those cities. In reply, Ald. Robinson said Mr. Waugh, apparently, would prefer that the whole of the extra cost of coal, wages, &c., should come out of the bulk consumers, but, so far as they were concerned, the Committee had arranged that any variation in the price of coal should be met, and the bulk consumers had met them to the extent of £13,000 in regard to the extra cost of coal. The returns of the department proved that the charges for bulk supply were profitable, but the Committee was supplying firms who could produce their own power, and it was desirable, if they wanted a cleaner city, that the power should be produced at the municipal

works. The department had all kinds of consumers to supply, and a general flat rate was out of the question. The minutes were adopted as amended.

Burmah.—The Rangoon Municipal Committee has resolved not to agree to the proposal to enter into a fresh agreement with the Rangoon Electric Tramway Co. for the public lighting of Rangoon for a period of 21 years, but desires that the Roads and Buildings Sub-Committee should further examine the whole question.—*Indian Engineering.*

Cavan.—Mr. J. P. Tierney, of Dublin, has been authorised to prepare a scheme for an installation of electric lighting in the workhouse.

Chile.—The *Diario Oficial* (Santiago) publishes decrees granting concessions for the installation of electric lighting and power systems (overhead transmission) to Don Leopoldo Chasau—in the town of Los Sauces, Department of Angol; Don Rojelio Pinto—in the town of San José de Maipo, Department of La Victoria; Don Eduardo Valdivieso V. (on behalf of Don Erardo Setz H.)—in the town of Lanco, Department of Valdivia.—*Board of Trade Journal.*

Colchester.—**PROPOSED NEW PLANT.**—A report as to the necessity of installing additional plant at the electricity works, in order to be in a position to resume the lighting supply immediately after the war, is to be prepared by the engineer, with a view to a loan being applied for.

Continental.—**FRENCH WATER POWERS.**—In reply to a question on the subject in the French Parliament, the Minister of Agriculture recently stated that, in accordance with a decree issued in December of last year, all questions relating to the utilisation of the power of non-navigable rivers and streams in the country had for the period of the war been transferred from the Ministry of Agriculture to the Ministry of Munitions. At the same time, close co-operation continued to exist between the two departments, with the object of utilising all available water power, and, as affording some idea of the work that had been done, he stated that plant to the extent of 400,000 H.P. had been established, or was in course of construction, in the Alps, the Pyrenees, and in central France. He also pointed out that, in the case of many of the agreements entered into on behalf of the French Government with hydro-electric undertakings, powers had been reserved under which the generating stations were under agreement to supply for a number of years after the war a certain proportion of the current generated at a cheap rate. Several of the plants in question were in connection with factories making explosives with a calcium carbide base. With the cessation of hostilities, it would not be difficult to convert such plants to cyanamide manufacture, and consequently there were good prospects of large and relatively cheap supplies of synthetic nitrate manures, which would be of great benefit to French agriculture.

SPAIN.—La Sociedad Electrica Rocajo has secured a concession to establish a plant to utilise the water power of the River Najerilla near Brieva (Province of Logrono) in the generation of electrical energy for lighting and power purposes.

The Co-operativa Electrica de Santiago de Compostela is the title of a company, with a million pesetas of capital, formed to supply electricity in Compostela.

Dublin.—During a discussion at the Port and Harbour Board, it was mentioned that there was an increasing demand on the north side of the river for electricity, and it was decided that the Board's engineer should consult with the Corporation's engineering authorities on the subject.

Iceland.—It is announced from Copenhagen that a Danish company has just been formed with the object of utilising the water power resources of Iceland.

India.—According to *Indian Engineering*, the extension of the Coonoor water supply is under contemplation. "In connection with the above, it has been suggested that in regard to the question of generating electricity from the Ralliar Waterfalls, it is found that the current thus derived would be sufficient to light the whole station with electricity as well as to supply all the neighbouring estates with power for their factories. The initial outlay would be a lakh and 40,000 rupees, but at present the annual cost of lighting the station is nearly Rs. 6,000, whereas with electricity it would be less than one-third that amount.

Owing to the shortage of electricity meters, and as an alternative to declining to connect new consumers, the Bombay E.L. & T. Co. has submitted to the Corporation a proposal that such new consumers should be charged 1 rupee per point per month, this figure being based on the yield per point of existing consumers of various classes during a recent six months. The Corporation is recommended by its Committee to agree to this as a temporary measure, provided that meters are fitted within one year after the termination of the war.

Leith.—**PRICE INCREASE.**—The T.C. has passed the following increases in the charges for energy:—Power from 1½d. per unit to 1½d. per unit net; lighting from 4½d. to 1½d. per unit net. Previously discounts were given. The changes are necessary to meet an estimated deficit of £4,579.

Limerick.—**WAGES.**—On a demand by the electric lighting staff for an increase of 10s. per week in wages, the Electricity Committee offered 5s., which was accepted.

London.—L.C.C.—The Finance Committee recommends the sanction of the Council to the borrowing of £27,825 by the Poplar B.C. for electricity generating plant.

Morocco.—Under the auspices of the Compania Transatlantica, of Barcelona, Spain, a small central electric lighting station has just been completed in Tangiers. Although the plant at present installed only comprises a 200-H.P. Sulzer-Diesel generating set, it is proposed to extend it up to eight such groups in the near future. The engines are to be adapted to run with tar oils, and also, if necessary, to use sea water for cooling purpose.

New Zealand.—The Government National Efficiency Board has invited Mr. J. Orchiston, Chief Electrical Engineer to the Post and Telegraph Department, to report on his proposal for establishing an industry in New Zealand for producing nitrates from the air. Mr. Orchiston has acquired data dealing with the cost of hydro-electric schemes, and in no case, he said, can electricity be generated as cheaply as by utilising any of the large falls in the south-western sounds of New Zealand. One of the simplest propositions is that presented in utilising the Bowen Falls, in the Milford Sound. He estimates that, after making full allowances for all contingencies, energy could be produced for one-fiftieth part of a penny per unit, or 1 H.P. at a cost of £1 per annum. At the Bowen Falls there is deep water close to the side of the sound, and perfect shelter in all kinds of weather.—*Journal R.S. of Arts.*

Rotherham.—The Electric Light and Tramways Committee has received a communication from the Ministry of Munitions that its present policy is that no facilities will be given to the Sheffield Corporation beyond those already authorised, so long as the Rotherham Corporation has sufficient plant for the inter-supply of current to the Sheffield Corporation on reasonable terms.

St. Anne's-on-Sea.—YEAR'S WORKING.—The annual report of the working of the Council's electricity undertaking for the year ended March 31st last shows a total revenue of £14,952, working expenses amounting to £11,368, and special expenses £1,074, making the total expenses £12,442, and leaving a gross profit of £2,510; with £864 transferred from the war munitions account, making a total of £3,374; and deducting interest and sinking fund, and bank charges, &c., £3,459, a deficit on the year's working of £85 resulted, which has been debited to the reserve fund. During the year 1,494,488 units were sold, an increase of 187,188.

South Africa.—The Works Committee of the Krugersdorp (Transvaal) Municipal Council reports that it has under consideration the question of increasing the charges for electric light connections. It points out that the price of copper wire has risen from 10d. to 4s. per lb., and of other materials by at least 100 per cent.; also that at the present time it is impossible to obtain good cut-outs, and that makeshifts have to be used.

Stratford-on-Avon.—ELECTRICITY PRICES.—A Committee has recommended the T.C. not to accede to the request of the local Electricity Co. for leave to increase the charge for current for the period of the war and 12 months after, from 6d. to 6½d. per unit, but the matter has, by the casting vote of the Mayor, been referred back for re-consideration.

Stretford.—At a recent meeting of the U.D.C. it was reported that the clerk had submitted to the chairman of the Legal and Parliamentary Committee a statement of points which it was desirable should be given in evidence by the representatives of the Urban District Councils' Association before the B. of T. Electric Power Supply Committee. The following is a summary of the statement:—(1) Principle of distribution by local authorities should be retained; (2) that no charge should be made on the general body of ratepayers for the benefit of electricity consumers, and that the outstanding debt of any small superseded station should be taken over by the super-station authority; (3) that the super-station authority should be under obligation to supply energy in bulk; (4) that the super-station authority should be under obligation to supply energy to local authorities at uniform rates; (5) large power consumers should be supplied through the local authority, and not direct from the super-station authority; (6) local authorities should have preponderance of representatives on super-station authority. The Council approved the statement.

Todmorden.—The annual accounts of the Corporation Electricity Department, submitted last week, show an income from sale of current of £3,107; other income, £277; working expenses, £1,094 and a deficit on working of £709. Sinking fund and interest allowances amounted to £1,964, making a total deficit of £2,673, which has been met by a transfer from the district fund revenue account. The deficiency last year was £1,580. The loan capital outstanding at March 31st, 1917, was £19,585.

U.S.A.—The Kansas City Light and Power Co. has contracted with the General Electric Co. (U.S.) for two 25,000-kw. turbo-generators for its new power plant, which is designed for an ultimate capacity of 240,000 kw.

Wakefield.—The electrical engineer reports that during the past year, owing to the pollution of the river with chemical waste, considerable trouble has arisen from corrosion. In October a reserve stock of coal caught fire, occasioning considerable loss, and in February a fire occurred on the H.T. switchboard, interrupting supply for 9½ hours. During the year 4,415,108 units were sold, equal to 83 units per head of population.

Workington.—PROV. ORDER.—The T.C. has decided to apply to the B. of T. for a prov. order for electric supply.

TRAMWAY AND RAILWAY NOTES.

Belfast.—At the meeting of the Tramways Committee, it was reported that the receipts for the past month showed an increase of £1,600 as compared with the corresponding period of last year. A report on the state of the track was also presented.

Birmingham.—ARTERIAL ROADS.—An important report, embodying proposals for reconstructing and widening arterial roads, engaged the attention of the City Council last week. It stated that during the past 20 years £492,375 had been expended by the Tramways Committee and the Public Works Committee in carrying out the widening of parts of the main thoroughfares in connection with general improvements and electric tramway developments. The average yearly outlay amounted to £44,761. Notwithstanding that expenditure (large in comparison with the results achieved), not a single one of the city's main arteries had been so widened that its further widening was not a concern of the present generation. The proposal was to widen the eight great arterial roads which ran into the centre of Birmingham, together with four that led off them, to 110 ft. and 120 ft. The Tramways Committee was contemplating the adoption of the single-deck car, and it was hoped ultimately to run these on independent sleeper tracks. An advantage was that, if in the future it was decided to increase the gauge of the tramways from 3 ft. 6 in. to 4 ft. 8½ in. it could be done upon the sleeper-track system with comparative ease and low cost upon the width provided. The only practicable position for track, in a shopping or business street, was in the centre of the road, consequently it was necessary to provide a carriage way on either side. The minimum width required was 27 ft. for the tramway track and 24 ft. for each of the two carriage ways, making together 75 ft. between the pathways; footpaths 17 ft. 6 in. each, would give a total street width of 110 ft. The 27 ft. of tramway track would provide the necessary standing room for passengers. The cost of the necessary street widenings was estimated at £612,704—an amount which would be spread over a number of years. The tramway manager (Mr. A. Baker) states that the present cars are too heavy and cumbersome (a double-deck car such as now used weighs about 15 tons unloaded, and getting on for 20 tons loaded), that they accentuate the congestion of traffic, are noisy, and that much damage is done to the tramway track. The cost of maintenance, both to the track and rolling stock, is extravagantly heavy. The remedy is the provision of single-deck cars on independent tracks. It is estimated that the annual saving from independent sleeper tracks would be £70,000 in cost of reconstruction and repairs and maintenance of permanent way, £10,000 on repairs and maintenance of rolling stock, and £20,000 in operating expenses accruing from a better time table.

Bury.—The manager of the Corporation Tramways has reported to the Committee that, in consequence of increased rate of wages paid to the employés, it will be necessary to raise the fares; it has been decided to draw up a revised table of fares.

Continental.—SPAIN.—The abridged scheme for an underground electric railway at Madrid, 4 km. in extent, which is about being taken in hand, is estimated to cost 8,000,000 fr., being 4,100,000 fr. for the underground construction works, 1,000,000 fr. for surface works, and 1,650,000 fr. for rolling stock. There will be nine stations; the trains will be made up of five carriages, with accommodation for 250 passengers, the service being every two or three minutes.—*L'Electrotecnica.*

Dover.—At a meeting of the Tramways Committee, it was proposed to levy a special 6d. rate to meet compensation claims arising out of the recent accident; a suggestion was made that a 2s. 6d. rate would be required, which would give some £23,000. A scheme for reducing the gradient on the hill on which the accident took place was considered.

East Ham.—YEAR'S WORKING.—In a recent issue we gave the borough treasurer's figures for the working of the Corporation tramways during 1916-17, showing a deficit of £2,395. According to figures published by Mr. Ullmann, the manager, the deficit amounted to £3,213. During the year 18,619,000 passengers were carried, as against 20,128,000 in the previous year, the car-mileage being also reduced. The revenue per car-mile was 10'04d., as against 9'87d., and the operating cost was 8'83d. per car-mile, or nearly 1d. in excess of 1915-16. Some 40 per cent. of the receipts were from ½d. fares, but these were abolished on March 1st.

Halifax.—DISCOUNT TICKETS.—The Tramways Committee, last week, agreed to grant a request by the organised tradesmen of the town that the Committee should sell tickets in blocks of 500 each, at a discount of 25 per cent.

Leeds.—TRAFFIC RETURNS.—The accounts for the city tramways undertaking for the first six months of the current year up to the end of September were presented to the Tramways Committee on Monday. The total receipts amounted to £296,867, which is a record for six months' working, and an increase of £28,846 on last year's figures. These figures have been attained in spite of a decreased service, 40,724 fewer car-miles having been run. The earnings per car-mile work out at 14'618d., a very high figure, being 1'529d. more than in the corresponding period of last year. The number of passengers carried was 61,823,986—4,565,347 more than last year. The number of cars in use was 238, and the amount per head contributed by the population was 10s. 9d. The working expenses for the half-year total £150,190, an increase of £22,000, being about half the total receipts. The increase in ex-

penditure is attributed to war bonuses and to enhanced cost of materials used in repairs. Traffic expenses amounted to £12,583 and general repairs to £8,869. Increased income-tax and reserve fund charges cover £6,000. The estimate for the whole year provides for a surplus of £55,000 in relief of rates, and this, we gather, is likely to be fulfilled.

London.—L.C.C.—The Highways Committee reports that during the 11 weeks ended October 3rd 127,341,961 passengers were carried on the Council's tramways, a decrease of 3,469,325 as compared with the corresponding period last year. The traffic receipts during the same period amounted to £635,415, an increase of £83,144; the total receipts from April 1st, 1917, show an increase of £187,806 as compared with 1916.

TELEGRAPH AND TELEPHONE NOTES.

A Large Submarine Cable.—The New York Telephone Co. has laid across Raritan Bay a cable nearly 5½ miles in length, containing 74 pairs of wires, and superseding 3,000 miles of overhead wires previously in use on the land route. It is claimed that this is the largest submarine cable in the world.

Argentina.—Early in August the Ministry of Marine was informed that a wireless station was at work in the neighbourhood of Trelew, and a search was made. Eventually it was discovered with the aid of a cruiser, on the premises of a business house in the town of Trelew. Considerable reserve is maintained on the subject.

The concession applied for by Señor A. Schwimmer for the installation of an automatic telephone system in Buenos Aires has been discussed by the Municipal Commissioners, and referred back to the Mayor.—*Review of the River Plate.*

Dewsbury.—The Chamber of Trade has put before the Home Office a scheme of telephone warning to shopkeepers of air raids, so that shop lighting restrictions may be relaxed, at any rate within a quarter-mile radius of the centre of the town. The proposal is that six shops, covering six areas of the town, should receive telephone warning of a raid from the exchange. These six tradesmen would each warn six others, and they, in turn, would warn groups of shopkeepers in their neighbourhoods, as allotted to them. It is held that by this means, the whole of the lights of the 196 shops in the main town area could be extinguished within five minutes of the receipt of the original telephone warning from the exchange. Shops electrically lighted would not need the warning, as their lights would be cut off at the power station. The Home Office has asked the Chamber for further details, pointing out that the scheme presents difficulties, but that it is to receive every consideration. The Chamber is also conferring with the chief constable of the town as to police co-operation.

Dutch Cable Blockade.—Commercial cable communication with Holland was interrupted last week by order of the British Government until such time as the Netherlands Government consents to put a stop to the transit of sand, gravel and scrap metals through Holland from Germany to Belgium.

The use of British cables is a concession which cannot be claimed as a right, as any messages which are allowed to pass do so as an act of grace.

Windhuk (South-West Africa Protectorate).—A party of Union of S.A. members of Parliament, whilst making a tour of the Protectorate, paid a visit to the wireless station at Windhuk, and a description of the station was given to them by Capt. Kellaway. The motive power consists of two Diesel oil engines. The large A.C. generators are designed for a single-phase output of 250 kW. at 500 volts and 350 cycles. The transformers are of the oil type, designed to step up from 500 volts to 52,000 volts. There are five masts each 390 ft. high, weighing roughly 30 tons each, all insulated, and all maintained in position by steel wire cables. The transmitting aerial consists of 20 silicon-bronze cables, 10 running south-east and 10 south-west from the apex. The two receiving aerials consist of ½-in. diameter silicon-bronze cables. The battery comprises 128 Tudor cells of 270 ampere-hour capacity.

It was explained that the transmitting plant of the wireless station was inoperative owing to the removal of essential parts by the Germans. The receiving of messages is being maintained.

CONTRACTS OPEN AND CLOSED.

OPEN.

Dublin.—November 1st. G.N. Railway Co. (Ireland). Six or twelve months' supply of general stores (including several electrical items). See "Official Notices" October 5th.

Grimsby.—October 29th. Corporation. House service boxes and house fuse-boxes and fittings. See "Official Notices" October 12th.

CLOSED.

Bath.—C.C. Five-ton "Sentinel" steam wagon, £970 net: Alley & MacLellan, Ltd.

Cape Town.—Tenders received for the wiring of the new Union Jack Club:—

R. G. Jack	(accepted)	£210
J. A. Woods & Co.		237
Edward A. Shaw & Co.		242

Glasgow.—Tramways Committee. Tenders recommended:—Cable: Liverpool Electric Cable Co., Ltd.; B.I. and Helshy Cables, Ltd.

Hereford.—T.C. Electric motors and pump: Mather and Platt, Ltd., £736.

London.—L.C.C.—Highways Committee. Electric cables for the Council's tramways:—

Western Electric Co., Ltd.	(accepted)	£1,430
W. T. Henley's Telegraph Works Co., Ltd.		1,462
Callender's Cable & Construction Co., Ltd.		1,480
B.I. & Helshy Cables, Ltd.		1,480
Johnson & Phillips, Ltd.		1,480
Siemens Bros. & Co., Ltd.		1,490
W. T. Glover & Co., Ltd.	(part only)	950
(General Manager's estimate, £1,200.)			

Steel tires for tramcars (1,500 driving-wheel and 750 pony-wheel tires). Accepted tenders:—

Brown-Bayley's Steel Works, Ltd.	£7,294
Patent Shaft & Axletree Co., Ltd.	7,990

Southend-on-Sea.—T.C. Tramway undertaking:—

Edgar Allen, Ltd.—Switches, crossings and fish-plates, £54.
Hadfields, Ltd.—Three pairs of points and three crossings, £237.

Sunderland.—T.C. Electricity and Lighting Committee. Steel tubes: Dewhurst Engineering Co.

FORTHCOMING EVENTS.

Institution of Mechanical Engineers.—Friday, October 19th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. "A Comparison of the Working Costs of the Principal Prime Movers," by Mr. Oswald Wans. General meeting.

Junior Institution of Engineers.—Friday, October 19th. At 8 p.m. Lecture on "The Application of Coal Gas to Commercial Vehicles," by Mr. W. A. Tooke.

British Empire Producers' Organisation.—Thursday, October 25th. At 1.30 p.m. At the Waldorf Hotel. Luncheon meeting. Marquis of Graham to preside. Guest, Right Hon. John Hodge, P.C., M.P., Minister of Pensions.

Institution of Civil Engineers.—Thursday, October 25th. At 3.30 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Meeting to consider the establishment of a central organisation for improvement in and better co-ordination of engineering training, and the appointment of a representative committee to initiate action.

NOTES.

Volunteer Notes.—COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel C. B. Clay, V.D., commanding:—

Officer for the Week.—Lieut. C. E. Campbell.

Drills.—Week ending Saturday, October 27th, 1917:—

Monday.—No. 3 Company, Left Half. Recruits, signalling, 6.30.

Tuesday.—Physical drill and bayonet exercise, 7.30.

Wednesday.—No. 1 Company, 6.30.

Thursday.—No. 2 Company, 6; signalling, ambulance, 6.30.

Friday.—No. 3 Company, Right Half. Recruits, 6.30.

Musketry.—Belvedere Road. Tuesday, Wednesday, and Thursday, 5.30 to 7.

Note.—The Medical Officer will attend for examination of recruits, &c., on Thursday at 6.

Unless otherwise indicated, all drills take place at Headquarters.

(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

Cranemen's Wages.—There has been correspondence between the Aberdeen Harbour Board and the Chief Industrial Commissioner with respect to the wages of steam and electric cranemen, who have asked for an increase. After full consideration, the Board's Committee has decided that the matter is not one that can be settled by mutual agreement, and has replied to the Industrial Commissioner stating that the difference must be settled by arbitration.

Mechanical Arms.—At the Junior Institution of Engineers, on Monday evening, Mr. E. W. Hobbs read a paper on "Mechanical Arms." The anatomy and mechanics of the natural arm were described, and reference was made to early artificial arm work and to the requirements of an efficient mechanical arm. The effect of the amputation and its bearing on the mechanical arm were discussed, and other points touched upon were:—The vocation of the wearer and its bearing on the mechanical arm; the mechanism of the mechanical arm; the mechanism of the mechanical hand; various types of artificial limbs, their peculiarities and working; and some results achieved. In connection with the paper, Mr. Hobbs has arranged for a demonstration on Saturday, October 27th, at 3 p.m., at the Hall of the Balham Constitutional Club, 241, Balham High Road, S.W. Afterwards he will show his works, which are near at hand to anybody who is specially interested.

Validity of Tungsten Wire (German) Patent Upheld.—

The German patent No. 269,498 (1910) granted to the Allgemeine Elektrizitäts Gesellschaft, with priority from October 6th, 1909, on claim (1) and from February 23rd, 1910, on claim (2), has been upheld successfully against the annulment suit brought by the Wolframlampe A.G. (Augsburg), the Radium G.m.b.H. (Wipperfurth), and the J. Pintsch A.G. (Berlin). One of the most interesting patent cases of recent years is thus decided wholly in favour of the patentees. The patent in question relates to a process for the manufacture of tungsten wire for use in glow lamps. According to the specification, the process consists principally in bringing tungsten powder to the form of a coherent body by suitable means—heating it to 1,000–1,200°C. in an iron tubular furnace, through which hydrogen is passed, and then raising it to near melting point by the passage of current, the metal being again in an atmosphere of hydrogen. Finally, the metal is prepared for use by repeated mechanical working (rolling, hammering, drawing, &c.). The text of the actual claims is:—(1) Process for manufacturing tungsten wire for electric glow lamps, characterised by coherent pieces of tungsten being subjected to mechanical "working" until they become flexible and ductile at ordinary temperatures. (2) Use of initial material in the form of a comparatively coarse powder, the porous body formed therefrom being heated to a very high temperature.

Opposition to this patent and the subsequent action contesting its validity were based on the contention that prolonged mechanical working was a well-known means of securing flexibility and ductility in metals, and its application to an individual metal (tungsten) not previously considered ductile was not sufficient ground for granting patent rights. The Courts did not support this view. The following opinion is interesting:—"The literature submitted shows that many attempts had been made to make tungsten filaments by drawing (instead of by squirting and paste processes), using methods employed in general wire drawing or for the manufacture of other metal filaments (*e.g.*, tantalum). It is clear, however, that one could not simply substitute one metal for the other. All assertions and proposals are, therefore, to be ruled out, in which the behaviour of tungsten is deduced from that of other metals."

The firms in enjoyment of the valuable patent thus maintained are A.E.G., Siemens & Halske, the Deutsche Gasglühlicht A.G., the Bergmann Elektrizitäts Werke A.G., and the firm of Philips (Eindhoven). These firms have now a monopoly in the (German) manufacture of drawn-wire tungsten filament lamps, but this monopoly does not embrace:—(1) The manufacture of "Einkristallfaden," by Pintsch's process (*E.T.Z.*, page 234, 1917); (2) drawn-wire filaments of tungsten alloy, even though tungsten be the chief ingredient; (3) tungsten wire-drawn by the same process for other applications than glow lamps.

The various actions commenced by the A.E.G. in respect of infringements of its Patent No. 269,498 must now be decided against defendants wherever the latter have been making filaments of pure drawn tungsten wire. A considerable portion of the German glow lamp industry is thus paralysed unless the offending members succeed, at the last moment, in securing licences from the A.E.G.—*E.T.Z.*

Ventilation on the Tube Railways.—Referring to this

subject, the *Times* states that it has received numerous inquiries regarding the possibility of disaster to the ventilating apparatus of the tube railways, and as a result has obtained the following statement from the engineer to the London Electric Railway Company:—

"We are unable to anticipate any condition which will render the air in the tube railways unsafe. The tube railways ran for a number of years without any artificial ventilation whatever. There is very considerable ventilation caused by the motion of the trains in the tunnels—quite sufficient in itself to prevent the air becoming unpleasant. The shutting down of the whole of the electrical supply on the London Electric Railways would not affect the running of the fans in that we have an alternative means of power supply from a quite independent source. Individual damage to one station, or one fan, would only put that fan out of commission, and the fans at adjacent stations would keep the ventilation going."

We stated in our last issue that the risk was small.

The A.S.E.—The *Times* states that the Executive Council of the Amalgamated Society of Engineers has passed a resolution recommending that the Society should secede from the Engineering and Shipbuilding Trades' Federation. The opinion of members will be obtained by a ballot. Although the engineers' membership is practically half that of the whole of the Unions represented, their representation on the Federation is only equal to that of the smaller Unions, and this fact has caused considerable irritation.

L.C.C. Electrical Employees.—The Highways Committee reports that leading cable hands, cable hands, overhead linemen, feeder pillar hands and watchmen (Southern Section) in the electrical branch of the tramway department have asked that their war bonus may be increased to 19s. a week, that men paid by the hour be guaranteed minimum wages for 50 hours a week, and that men paid by the shift, day, or week, be guaranteed minimum wages for six shifts or days a week, and that their requests be referred to the appropriate Conciliation Board in the event of the Council not acceding thereto. A fitter's labourer and a skilled labourer on the sub-station repairs staff have asked for additional war wages of 12s. a week, and switchboard attendants and temporary sub-station

attendants (Northern Section) have asked for an additional war bonus of 8s. a week. The Committee recommends that the applications be referred to the Electrical Conciliation Board.

Foreign Trade.—SEPTEMBER FIGURES.—The official returns of imports and exports during last month contain the following electrical and machinery figures:—

	Imports.	September, 1917.	Inc. or dec.	9 months, 1917.	Inc. or dec.
Electrical goods	...	91,513	— 38,036	— 189,955	
Machinery	...	805,792	+ 214,815	— 63,313	
EXPORTS.					
Electrical goods	...	186,999	— 210,282	— 855,882	
Machinery	...	1,171,666	— 290,552	+ 126,659	

Motive Power from Plant Life.—Lecturing, last week, at the Austin Works, Northfield, Prof. F. W. Burstall, of Birmingham University, said the question of suitable fuels for automobiles had become a serious problem. It had long been predicted that a time would come when some other fuel would have to be employed unless the use of the mechanically-propelled vehicle was to be seriously retarded. The advent of the war and the extensive use of the internal-combustion motor had caused a shortage of petrol much more serious than would have been the case in times of peace. The position would not to any great extent be relieved by the advent of peace, owing to the fact that as time went on the use of small motors would be much extended.

Prof. Burstall outlined some of the methods which might be used for the production of fuel. Many of our ablest men, he said, had been working on this problem for a considerable time. The amount of light spirit derived from carbonaceous material was a limited quality, and very much less than the world's demand. One alternative was to employ an engine capable of dealing with the heavier oils, as was being done in many directions by the heating and working-up of the heavy oil into a gas. Another was the use of gas in a more or less compressed state, which undoubtedly had many features to recommend it. Such solutions were only partial. Alcohol formed practically an ideal substance for engine purposes, but its use as fuel had been retarded by its high price. For the main part, alcohol for manufacturing purposes was derived from starch which was unsuitable for food, and the scarcity of the raw product would most certainly increase its price as the demand increased. We did not know how far the direct change from sunlight to starch could be carried out in suitable localities in suitable plants, but there was no doubt the energy was there in quantities sufficient to satisfy all the demands; what had to be learnt was how to utilise and store up that energy in a form rendering its applications simple and effective.—*Birmingham Daily Post*.

Prize Essay.—"Hydro-Electric Power in India: its Present Position and Possible Future Development" is the subject selected by the syndicate of the Bombay University for competitive essays for the Ashburner Prize for 1919.—*Indian Textile Journal*.

Patents and Alien Enemies.—Application has been made to the Board of Trade by Messrs. J. S. Highfield, A. A. C. Swinton and P. D. Tuckett, to avoid or suspend 17 patents granted to Farbwerke vorm. Meister, Lucius & Brüning, Schwerin, and Ges. für Elektro-Osmose m.b.H. for processes relating to electro-osmosis and similar purposes; and for the grant of licences under "Applications to be vested in the Custodian," in respect to 17 applications in the name of the Ges. für Elektro-Osmos m.b.H. and Elektro-Osmos Akt.-Ges. (Graf Schwerin Ges.), of a similar nature.

The Association Movement.—The following important letter reaches us just as we go to press:—

"My attention has been called by several members of the Cable-Makers' Association to an article by Mr. H. H. Berry in your last issue, in which he appears to claim that he is the founder of the C.M.A. I have myself, as a director of W. T. Glover & Co., Ltd., been closely associated with the C.M.A. for over 14 years, and in that time have never heard Mr. Berry's name suggested as connected with the foundation of the Association. From inquiries made since Mr. Berry's article appeared, it would seem that he certainly had the idea to found a trade organisation, and took some steps in that direction; but these came to nothing. The actual genesis of the C.M.A. came in quite another direction, springing, I believe, from a beginning made by Mr. James Taylor (Helsby Telegraph Co., Ltd.) and Mr. George Sutton (Henley's Telegraph Works Co., Ltd.). But the definite decision to found the Cable-Makers' Association was taken at a meeting convened in 1898 by Mr. Henry Edmunds, then chairman of W. T. Glover & Co., Ltd., and the first formal meeting, at which the foundation was accomplished, was held on January 10th, 1899, when the following signed the roll in the order given:—

"Henry Edmunds (chair), Alex. Siemens, J. J. Easton, W. P. J. Fawcus, James Taylor, Francis Lamb, W. E. Gray, Jas. Connolly, G. Sutton, R. J. Hatton, W. Claude Johnson, J. Paterson, Godfrey Samuelson, A. H. Howard.

"It is with no wish or intention of in any way belittling Mr. Berry's efforts in connection with the Association movement that I am writing, but historical accuracy and justice to other early workers in the now fashionable field of trade organisation make this correction necessary."

"LLEWELYN B. ATKINSON.

"Secretary, Cable-Makers' Association,

"Sardinia House, Kingsway, W.C. 2.

"October 18th, 1917."

Fuel Research.—The Report of the Fuel Research Board to the Department of Scientific and Industrial Research on their scheme of research and on the establishment of a fuel research station has been issued. It states that in the first report (which was not published) the Board proposed two main lines of research: a survey and classification of the coal seams in the various mining districts by means of chemical and physical tests in the laboratory; and an investigation of the practical problems which must be solved if any large proportion of the raw coal at present burned in its natural state is to be replaced by the various forms of fuel obtainable from coal by carbonisation and gasification processes. The two lines can be most satisfactorily dealt with side by side. In preparation for the organisation for the first line, however, an experimental study of standard methods for the examination of samples of coal in the laboratory has been made, and as a result of experimental work carried out in the Fuel Laboratory of the Imperial College of Science and Technology a test has been elaborated which, by direct weighing and measurement, gives the yields of gas, oil, water, and carbonaceous residue which results from carbonisation at any definite temperature, with simple apparatus, which is being standardised. The representatives of the coal owners show every disposition to co-operate in the work of collection and registration of samples when the Board is ready for them.

The second line of inquiry has been led up to by a variety of influences during the past eight or ten years, including the demands for cheaper and more ample supplies of electrical energy, for home supplies of fuel oil for the Navy and of motor spirit for the Transport and Air Services, and for smokeless domestic fuel, due to the growth of public opinion on the subject of smoke prevention. The only development which would satisfy all these needs simultaneously would be the replacement of a large proportion of the raw coal which is at present burned in boilers, furnaces, and domestic fires, by manufactured fuels prepared from raw coal by submitting it to distillation. The gas retort and coke oven have become highly developed appliances for the carbonisation of coal at temperatures ranging from 900° to $1,200^{\circ}$ C., on which subject a great amount of experience and trustworthy data are available; but as regards the carbonisation of coal at low temperatures there is no such body of experience and information in existence. The way is clearly open for a serious attempt to determine whether an economical and efficient apparatus can be devised for the carbonisation of coal at low temperatures, and whether, by its use, products will be obtained of a collective value greater than that of the original coal, plus the cost of carbonisation and handling. The evolution of such an apparatus is at the root of the whole matter.

The questions before the Board are whether the 35 to 40 million tons of raw coal used annually for domestic heating can be replaced by smokeless fuel prepared by the carbonisation of the coal; whether adequate supplies of fuel oil for the Navy can be thus obtained; whether supplies of town gas can be produced more economically by new methods of carbonisation; whether electric power can be obtained more cheaply if the coal used for steam raising is first subjected to the processes of carbonisation and gasification; whether more scientific methods of using fuel will enable the peat deposits of the United Kingdom to be utilised for industrial purposes; and whether the use of gaseous fuel in industrial operations can be forwarded by the development of more scientific methods of combustion. The answers to these questions will only be obtained by co-ordinated research carried out on the lines of a broad and well-considered scheme.

Outlets for all the products of carbonisation must be found; no new scheme can be justified if it can only live by poaching on the preserves of the existing industries. The Fuel Research Board, which is in touch with other Government departments, is exceptionally placed for the furtherance of schemes which involve the finding of large outlets for such products.

Enormous quantities of coke would be produced, and its disposal at a profitable price is a vital question; the research scheme must, therefore, include a very complete inquiry as to the use and value of this coke for the direct firing of steam boilers; its gasification in producers and recovery of its nitrogen as ammonia; and its use for industrial and domestic heating.

As an illustration of the complicated inquiries which will have to be conducted before an answer can be given to what seems to be a simple question, the Board points out that there is a very general belief among electrical experts that the future of British industry will be greatly affected by the cost at which power in bulk can be supplied in the form of electricity. It has been proposed, for instance, that large electrochemical works should be established in this country for the manufacture of products which in the past have been manufactured in parts of the world where cheap water power is available. In this connection it has been suggested that the cost of producing power from coal in this country would be substantially reduced if, instead of burning the coal directly under the steam boilers, it were first subjected to carbonisation and gasification processes which, in addition to fuel gas, would yield valuable by-products. Plausible statements have been issued showing the enormous savings or profits which would accrue if schemes of this sort were adopted. Unfortunately these estimates have generally been made on a very slender foundation of knowledge and experience. On the other hand, those who by experience and practice are best qualified to judge, hesitate to prophesy as to what the economic result of a combined carbonisation and power generating scheme would be, but they agree that the interests at stake are so great that the question ought to be authoritatively answered once for all. But no answer can be accepted which is not founded on the complete working out of the scheme, no important step in the series of operations being omitted or shurred over. This series of operations will start from the mechanical preparation of the coal

and its conversion into solid, liquid, and gaseous products by carbonisation. It will end with the delivery of a known weight of high-pressure steam under the conditions most favourable for power production by turbo-generators. In the proposed scheme of research the investigation of each of the steps involved in the above inquiry is provided for. Three, at least, of these steps involve pioneering work on an industrial scale, and the work may occupy a considerable time. The Board realise that it is possible that the net result of this particular inquiry may be to show that purely as a means of cheapening the cost of electric power, the use of carbonisation methods has not much to commend it, but that certain incidental advantages will justify its use in particular cases.

A Fuel Research station, fully equipped for carrying out operations on an industrial scale, has been planned, and Dr. Carpenter, on behalf of the South Metropolitan Gas Co., has offered to lease to the Government, at a nominal rent, sufficient land at the East Greenwich Gas Works for the purpose, as well as to assist in its design and erection, and to purchase at market prices the surplus products resulting from its operation.

The Report is signed by Sir George Beilby, Director of Fuel Research; the other members are Sir Charles A. Parsons, Sir Richard Redmayne, and Sir Richard Threlfall, with Prof. W. A. Bone as consultant.

Engineers' War Bonus.—The Minister of Munitions announces the granting of a $12\frac{1}{2}$ per cent. bonus on the earnings of fully qualified skilled engineers and moulders rated at or above the current district time rate for turners or fitters while employed on or in connection with munition work and paid at plain time rates without the addition of any bonus. This new order means that the skilled man is put on terms of equality with the unskilled or semi-skilled man, who, paid on piecework for mechanical production, has been able to earn more than the skilled man who taught him his job. The new bonus does not interfere with or substitute bonuses to skilled men dependent on time-keeping and on output and war advances to meet the cost of living, but it does not apply to workmen paid an upstanding wage which covers overtime, or other allowances. It accrues from the beginning of the first full pay day following October 12th, and the first payment must be made by the first full pay day in November.—*Manchester Daily Dispatch.*

Fire in Leipzig Telephone Exchange.—On August 9th a serious fire occurred on the switchboard of the Leipzig Telephone Exchange, the cause being apparently the failure of a fuse to act. The installation consists of a central battery system, with accommodation for 20,000 connections provided on two separate series of boards. The fire broke out near the end of the first set of boards, and, although it was detected soon after its outbreak, it spread so rapidly that the whole of a multiple board was destroyed, and 11,000 subscribers were cut off. Incoming trunk service could be maintained, and about 5,000 subscribers served by semi-automatic equipment were not directly affected by the disaster. In order to restore communication as quickly as possible, the multiple board was cut at the point of the fire. About 4,000 lines (the call signals for which lay between the main distributing frame and the seat of the fire) were restored to service within two days. A start was then made in bridging the burnt-out sections, and, although space was so restricted that only a few men could work at once, more than 80,000 soldered joints were made, and regular service was restored "within a few days."—*E.T.Z.*

The Leaving Certificate and Munitions Work.—With regard to the Order of the Minister of Munitions abolishing the Leaving Certificate from October 15th, it is to be hoped that those who are engaged in the manufacture of munitions will not allow this alteration to operate in such a way as to disorganise work, impeding output and creating temporary unemployment. We trust that the action taken in conference with Trade Unions and Associations of Employers will be found to sufficiently meet the position. It should be borne in mind that skilled men must not be engaged or employed to replace unskilled or semi-skilled men employed on or in connection with munitions work, or to do work previously done in the establishment by such unskilled or semi-skilled men; that men must not be engaged or employed to replace women employed on or in connection with munitions work, or to do work previously done in the establishment by such women; and that employers must not engage labour for munitions work except to replace men who may leave, or to carry out orders in hand on which a blitional men may be immediately employed.

Fatalities.—A verdict of "Accidental death" was returned at the inquest on John Ashcroft (27), labourer, of Hooley Hill, who was killed at Messrs. Jones's sewing-machine works, Guide Bridge. The evidence was that the deceased, a discharged soldier, was working about 10 yards from the electric switchboard. All at once the lights were turned on, and someone cried, "Look at Johnny!" Ashcroft was seen with his right hand on the switch and his head thrown backwards. He was released, and a doctor sent for, but the man died before he reached the infirmary. The switch carried A.C., 210 volts, and the only explanation that could be offered was that one of the covers had become loose and formed a contact with the terminals, and the man might have put his hand on the cover. The switches were of an approved type, and were renewed in February. This one was tried next day and found all right.

During a storm at Durban, early in September, an electric light wire fell on a rickshaw boy, killing him. The bare feet and scanty clothing of the native would put him at a disadvantage compared with a man dressed in the European style.

Association of Electrical Station Engineers.—A meeting was held in Manchester on October 11th, at which 36 engineers were present. The following resolutions were carried unanimously:—"That the engineers in the Manchester district be urged to join the A.E.S.E., and endeavour to run the branch on the best possible lines."

"That this meeting of Manchester staff engineers expresses a vote of confidence in the London Branch in their claim to represent the interests of staff engineers as against that of the E.T.U."

Officials and a Committee were provisionally appointed, and it was suggested that the A.E.S.E. should be open to accept mechanical engineers as well as electrical engineers holding staff appointments. The next general meeting is to be held on October 25th, place and time to be announced.

London Power Station Engineers.—The following letter has been addressed by the Association of Electrical Station Engineers to all chief engineers and London Borough Councils:—

Sir,—I am instructed by the Executive Committee of the above Association representing the following engineering grades of power station technical assistants of London electricity supply authorities:—

Engineers-in-Charge.
Assistant do.
Junior do.
Mains Assistants.
Meter Superintendents.
Draughtsmen.
Testing Engineers.
Installation Inspectors.
Commercial Assistants and
Publicity Engineers.

To request immediate consideration of the following resolutions passed at a recent conference of power station engineers represented by this Association, and to ask that you will bring the matter before your Council at the earliest possible moment.

1. That in view of

- (a) The abnormal increase in the cost of living;
- (b) The fact that operative staffs have been met in this matter by various awards of the Committee of Production (Ministry of Munitions).

A request be made that

A bonus or war wage of 15s. per week be granted to all engineering assistants in the above mentioned grades dating from August 1st, 1917.

2. That in view of

- (a) The anomalies in remuneration of engineering assistants in the above-mentioned grades created during the past three years by the fact that no uniformity of treatment has obtained amongst supply authorities on the question of annual increments for added responsibilities;
- (b) The fact that the remuneration of such assistants has at no time been commensurate with the qualifications demanded.

A request be made that

A 25 per cent. increase of the pre-war (July, 1914) salary attaching to the offices of the engineering assistants in the before-mentioned grades be granted to all such assistants.

3. That in view of

The lack of uniformity obtaining in London power stations amongst engineering assistants engaged on shift duties in the matter of

- (a) The number of hours per shift;
- (b) The number of shifts per week.

A request be made that

- (a) A normal shift shall consist of eight hours;
- (b) A normal shift week shall consist of six 8-hour shifts.

qualified as follows:—

That where the staff arrangements permit, the above concession be immediately made.

That where depletion of staffs due to war emergency do not permit, an undertaking be given that such condition shall obtain as soon after the cessation of hostilities as is practicable, or within a definite period of such date.

I shall be glad to have your assurance that the above matters will receive your careful consideration.

Yours faithfully,

W. ARTHUR JONES, A.M.I.E.E.

Hon. Secretary, A.E.S.E. (London).

The Association of Engineering and Shipbuilding Draughtsmen: London Branch.—The annual general meeting of this Branch was held on September 22nd, when about 350 members were present. Mr. E. H. Walker (President) was in the chair, and gave a very satisfactory report of the work of the London Branch since its formation in February, 1917. Interviews have been held with the Ministry of Munitions on the subject of leaving certificates, &c., and the Association has been represented at several arbitration cases concerning draughtsmen. Owing to the largely increased membership in the London area, it has been decided to form a new branch for S.E. London and district, the Acting Hon. Secretary's address being 12, The Brent, Dartford, Kent. The Association is at present being entirely reorganised on lines more in keeping with its national character; the headquarters are to be shortly removed to London, and a general secretary will be appointed to give his whole time to the Association. The membership of the London area is now about 700, and new members

are coming in daily. The London Hon. Secretary's address is 38, Craster Road, S.W. 2, to whom inquiries should be addressed.

Association of Mining Electrical Engineers.—The annual meeting of the North of England Branch of the Association was held in Newcastle-upon-Tyne, on Saturday last. Mr. Thos. H. Day, the hon. secretary, in his report stated that the war had greatly hampered their work, but interest in the Association was reviving now, and they expected a good year; there were 110 members in the district. In his financial report, Mr. Day said that not only was there a credit balance for the year, but there was in hand and invested practically £70. The election of officers resulted as follows:—President, Mr. C. A. Nelson (Wallsend and Hebburn Collieries); vice-presidents, Messrs. J. P. Foster (Leaholme) and S. A. Simon (Blackhill); secretary and treasurer, Thos. H. Day (Benton).

Perth Electricity Employees: Wages Award.—From a newspaper report that has been sent to us we gather that Sir Richard Lodge, of Edinburgh, recently heard the case of the Perth Corporation electricity works employees, and he has now given his award. Representatives of the undertaking and of the employees stated the points at issue. The advances awarded (to be paid from October 1st, 1917) are as follows:—Mains engineer, 5s. per week; shift engineers, 5s. per week; switchboard attendants, 3s. per week; fitters, 2s. per week; fitter's mate, 1s. per week; driver, 5s. per week; firemen, 7s. per week; joiner, 7s. per week.

Australian Metal Co. and the A.E.G.—We notice in the list of creditors in the winding up of the Australian Metal Co., Ltd., the following entries:—

Allgemeine Elektrizitäts Gesellschaft, Berlin, £12,641, £16,230, and £1476.

Electroculture.—Engineers and others who are endeavouring to interest agriculturists, &c., in electrocultural work, will be interested to know that Mr. W. T. Kerr, city electrical engineer, of Hereford, has had a series of lantern slides of electroculture installations prepared for lecturing purposes.

Apprenticeship in Electricity Supply.—In the course of correspondence recently, the engineer and manager of a small electricity supply system gave us the following particulars of the system of training given to the apprentices under his charge:—

In the first place, we distinctly state that the apprentice is to be taught engineering in connection with our generating station work and distribution system, and do not profess to turn out an electrical engineer for any branch of the business.

Our apprentices are employed on generating station work and on distribution and wiring work on alternate weeks during their first year. The latter includes cooker, motor, and heater installation and maintenance.

On meter testing, installation testing, and suchlike work in their second year.

During their third year they are employed in the office, where they learn book-keeping, stock-keeping, estimating, and mains map and record keeping, &c.

During the last six months they are paid a commission on all new connections canvassed for by them, in addition to a small wage.

We continue them in our employment at 30s. per week, plus this commission, when they are out of their apprenticeship.

Our wiring contracts are not large, the maximum at the present unsettled time being about £50, two or three of which we obtain each year together with numerous small contracts.

We have modern instruments for mains and meter testing, do our own calibration and repair of the latter, and carry out all our own mechanical repairs. Our book-keeping system is as modern as a high-class auditor can keep it, and our distribution work is all carried out in as modern a manner as in most large plants.

The class of youth we take could not afford to take a mechanical apprenticeship, and if they could not get a start at a small outlay, they would have no choice of a livelihood beyond a shop assistant or trade.

Only two apprentices have completed with us to date. One was appointed assistant electrical engineer at a Government station at £150 per annum, and the second had the choice of two posts as improver, at 25s. per week. Both were less than two months completed when they left.

From the foregoing you will see that, although everything is on a small scale, all learned is up-to-date work, as far as my knowledge and experience can make it.

We have often been impressed with the advantages of apprenticeship in a small undertaking, whether it be a factory or a power station, as the learner has a far better chance of acquiring experience in all branches of the business than in a large organisation, except in those cases where a special scheme of instruction is in force; and the system outlined by our correspondent appears to be admirably devised to attain the desired end.

The Decimal System.—In the House of Commons, on Wednesday, Dr. Addison informed Mr. King that the question of adopting a decimal system of weights, measures, and coinage was being considered by the Committee on Commercial Policy After the War.

Electricity in Aviation.—A big German bombing machine which lately landed in Holland was fitted with an electric installation driven by motor for the purpose of warming the aviator.—*Daily Telegraph*.

Appointment Vacant.—Assistant electrical engineer (£300), for the Government Railway Department, Gold Coast. See our advertisement pages to-day.

The Whitley Report and Industrial Unrest.—Mr. Neville Chamberlain, presiding, in Birmingham, at an address by Mr. Wilfrid Hill on "Industrial Unrest: Its Causes and the Solution," to the Birmingham Business Club, said that industrial unrest was nothing new; we had it before the war, and after the war we should be face to face with a great many problems under changed conditions which it would take all our statesmanship to solve. It was the business men, the managers, and the workpeople engaged in industry who best knew what were the difficulties and what were the possibilities. The proposals of the Whitley Commission were not going to satisfy everybody. Certain men who were frankly revolutionary in their aims would not accept an olive branch of any kind. There were, however, more moderate and more practical and sensible men, who were prepared to come to terms, if terms could be arranged of a reasonable character, and who were sincerely and patriotically anxious to promote the future prosperity of the country.

Mr. Wilfrid Hill, who is a member of the Reconstruction Committee on Relations between Employers and Employed, said that in the interests of the community it was high time that masters and men ceased fighting each other and became allies, joining their forces to fight the foreign foes of Britain's commercial supremacy. Competition abroad necessitated co-operation at home. The problem was to get rid of friction, and that could be accomplished by conciliation, not conflict. Realising this, the Government were engaged in an honest effort not only to investigate the causes of Labour unrest, but to facilitate and expedite their removal. With this object they had set up a Reconstruction Committee, which would make it its business to provide opportunities for employers and employed to meet and reason together. The proposals of the peacemakers, acting on behalf of the Government, were:—(1) A Workshop Committee in every factory, to be composed of representatives of the masters and workmen in equal numbers. They would meet fortnightly, in business hours. In the initial stages it was suggested that a representative of the Government should attend the meetings of these Committees in a purely advisory capacity. Next (2) there should be a Joint Industrial Council in every industrial district, to consist of representatives of the two sections in equal numbers, their meetings to be attended, for a time, at any rate, by a representative of the Government. These Local Committees would constitute a first court of appeal, to which grievances and knotty questions not satisfactorily settled by a Workshop Committee could be referred. They would also bring the firms of a district into closer touch, and substitute friendly co-operation for ruthless competition. Then (3) there should be a National Industrial Council composed of representatives of Employers' Federations and Trade Unions, in equal numbers. This would be a final court of appeal. It was not proposed at present to arm the National Council with power to enforce its decisions or to impose penalties. It would serve as an arbitrator, seeking to prevent quarrels between friends rather than to act as a judge pronouncing sentence on criminals. The triple organisation scheme of the Reconstruction Committee provided machinery which should make conciliation possible, and all that was needed was the good will of both employers and employed.—*Morning Post*.

Training of Disabled Soldiers.—Portsmouth Corporation is arranging to train disabled soldiers in mechanical, motor, and electrical engineering and acetylene welding.—*The Times*.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Worcester T.C. has increased the salary of Mr. A. W. POWELL, on his appointment as assistant engineer-in-charge at the electricity works, from £114 to £127 per annum; and that of Mr. H. CHRISTOPHER, costs clerk, from £117 to £127 per annum.

General.—Sir MAURICE FITZMAURICE, C.M.G., has been appointed to fill the vacancy on the Advisory Council of the Committee of the Privy Council for Scientific and Industrial Research, caused by the retirement, by rotation, of Mr. W. Duddell, C.B.E., F.R.S.

On October 11th, at Cardiff, Mr. J. G. BOMFORD, managing director of Messrs. Booth & Bonford, Ltd., electrical engineers, Cardiff, was married to Gladys, daughter of Mr. and Mrs. Walter Lewis, of Cardiff.

The *Indian Textile Journal* states that H.E. the Governor in Council has appointed Mr. T. G. SULLIVAN, temporary assistant electrical engineer, as electric inspector. Mr. Sullivan will be under the orders of the electrical engineer to the Government, and will exercise the powers and perform the functions of the electric inspector in the Bombay Presidency, excluding Sind.

Mr. T. E. ALLAN, of Lincoln, who has been connected with the management of Messrs. Robey & Co., Ltd., for several years, has been appointed to a seat on the board of the company.

Roll of Honour.—Gunner GEORGE DRAKE, R.F.A., formerly in the golf ball department of the India-Rubber Co., Silvertown, was awarded the Military Medal on September 28th. Private W. J. BALKWELL, Bedford Regiment, formerly in the

gutta-percha department of the same company, was very badly wounded in France recently.

Corporal C. C. J. SMITH, formerly on the Maidstone Corporation tramway staff, is reported killed, after being missing since June 7th.

Lance-Corporal T. H. ANDREWS, who was in civil life electrical engineer at the Star Picture Theatre, Leicester, has died of wounds received in action.

The D.C.M. for gallantry has been awarded to Lance-Corporal J. H. ENTICOTT, Oxford and Bucks Light Infantry, who was at the Rugby works of the B.T.H. Co. He had previously gained the Military Medal and bar.

Private A. W. JACOBS, City of London Fusiliers, who has fallen in action, was on the staff of Messrs. Johnson and Phillips, Ltd., Charlton.

The Military Medal for bravery has been awarded to Sergeant R. BAINBRIDGE, R.G.A., who was on the York Corporation tramway staff.

Second-Lieutenant N. C. WHITTALL, Royal Fusiliers, attached to the R.F.C., who has been killed whilst flying in France, took his commission in June, 1915, whilst with Messrs. Elliott Bros., Ltd., Lewisham.

At Bolton, last week, the Mayor presented the D.C.M. to Lance-Corporal JOHN WHARTON, R.E. The award had been granted for services connected with the Intelligence Department of the Forces. Lance-Corporal Wharton was engaged as an electrician with Mr. James Morris, of Bolton.

Sapper R. M. BOND, R.E., who has been killed in action, was employed in the drawing office of Messrs. Dick, Kerr and Co., Ltd., Preston.

Corporal H. THORNTON, R.E., reported wounded, was in the employ of Messrs. A. R. Farrer & Co., electrical engineers, Bradford.

Private F. WILKINSON, York and Lancaster Regiment, who has been killed by an enemy sniper, was an apprentice with Mr. V. Ferrand, electrician, Bingley.

Private W. BROWN, an employé of Messrs. Kennedy, Stark and Co., electricians, of Glasgow and Paisley, has been awarded the Military Medal.

Private J. ANDERSON, formerly an apprentice wireman in the Glasgow Corporation electricity department, has been killed in action.

Acting Corporal-of-Horse A. E. JACKSON, killed in action, was employed by the Electric & Ordnance Accessories Co., at Aston.

Corporal H. BOOTH, of the Royal Welsh Fusiliers, killed in action, was employed by the British Westinghouse Co., Ltd., Trafford Park.

Lance-Corporal J. WALMSLEY, Loyal North Lancashire Regiment, who gained the Military Medal in July, has been killed in action, aged 32. He was employed by Messrs. Dick, Kerr and Co., Ltd., Preston.

Obituary.—Mr. W. R. SYKES.—We regret to record the death, which occurred on October 2nd, of Mr. W. R. Sykes, of railway signalling fame. He was the inventor of the lock-and-block signal, and some 18 years ago formed the W. R. Sykes Interlocking Signal Co. He was connected with the electrical and other signalling work on a large number of railways. Mr. Sykes was 77 years of age.

Mr. R. BROCKLEBANK.—The death has taken place of Mr. Robert Brocklebank, Llandudno, who was on the staff of Messrs. Lance & Co., electricians, and formerly secretary to the Chester Engineering Co., Ltd. He was in his 61st year.

HERR R. O. HEINRICH.—The death is reported from Berlin of Herr R. O. Heinrich, the director of the Weston Instrument Co., of that city.

Will.—Mr. F. O. ERICHSEN, A.M.Inst.C.E., director of Messrs. James Simpson & Co., Ltd., engineers, left £8,806.

NEW COMPANIES REGISTERED.

Grosvenor Engineering Works, Ltd. (148,632).—Private company. Registered October 8th. Capital, £2,000 in £1 shares (1,900 7 per cent. cum. pref.). To carry on the business of electrical engineers and contractors, makers of and dealers in munitions, submarines, aeroplanes, aircraft, and components, agricultural implements, boilers, &c. The subscribers (each with one ord. share) are:—R. J. Murray, Merton Grange, Milner Road, Bournemouth, engineer; A. E. Morgan, The Pines, Penn Hill, Avenue, Parkstone, Dorset, motor engineer. The first directors are: R. P. Murray and A. E. Morgan. Secretary: C. Sutton. Registered office: The office of the Grosvenor Garage (Bournemouth), Ltd., Poole Hill, Bournemouth.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Creed & Co., Ltd.—Satisfaction in full (a) on April 26th, 1917, of debentures dated October 3rd, 1912, securing £3,525, and (b) on August 16th, 1917, of two mortgages (one collateral) dated February 4th, 1915, securing £1,500.

Torquay Tramways Co., Ltd.—Memorandum of satisfaction to the extent of £900 on September 28th, 1917, of charge dated March 8th, 1911, securing £60,000 has been filed.

Birmingham and District Power & Traction Co., Ltd. (19,077).—Capital, £700,000 in £1 shares (250,000 pref.). Return dated June 25th, 1917, 146,846 pref. and 112,331 ord. taken up; £559,789 paid. Mortgages and charges: £394,433.

Bat Meter Co., Ltd. (99,327).—Capital, £20,000 in 41 shares (12,000 pref.). Return dated August 24th, 1917, 10,683 pref. and 8,000 ord. taken up; £1 per share called up on £23 pref. and 15s. per share on 10,260 pref.; £8,118 paid; £8,000 considered as paid on 8,000 ord. Mortgages and charges: Nil.

Llangollen and District Electric Light & Power Co., Ltd.—Debiture dated September 20th, 1917, to secure £200, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: T. O. Ockleston and H. Wilson, 3, Tithebarn Street, Liverpool.

Notable Electric Co., Ltd.—Particulars of £2,000 debentures created September 14th, 1917, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's property, present and future, including uncalled capital. No trustees.

General Cable Manufacturing Co., Ltd.—Memorandum of satisfaction in full on July 26th, 1916, of debenture dated June 24th, 1915, securing £1,000, has been filed.

CITY NOTES.

Eastern Extension, Australasia, and China Telegraph Co., Ltd. The report for 1916 states that the gross receipts amounted to £1,221,497, against £950,080 for the previous year. The working expenses, including £74,608 for the maintenance of cables, absorbed £430,244, against £386,672 for the previous year, leaving £791,253, plus £38,816 brought forward. From the balance £246,853 was provided for income-tax and excess profits duty payable in England, and £30,096 for the interest on the mortgage debenture stock, leaving £553,121, out of which four dividends of 1½ per cent. each and a bonus of 2 per cent., amounting together to £240,000, were paid, making a total distribution for the year 1916 of 8 per cent., free of income-tax. The balance of £313,121 has been disposed of by transferring £250,000 to the general reserve fund, and carrying forward £63,121 to the next account. The agreement entered into by the French Government with the company in 1884, for providing and maintaining under a subsidy arrangement cable communication between Cochinchina and Tonquin having expired, the cable has been sold and transferred to the Government. After crediting capital expenditure with the cost of the cable (£121,455), which was originally debited to that account, the loss resulting from the transaction, amounting to £66,154, has been debited to the general reserve fund. Under arrangements made with the Governments of the Australian Commonwealth and New Zealand, the company's cable stations at La Perouse (near Sydney) and Wakapuaka (near Nelson) have been closed, and its cables between Australia and New Zealand extended to Wellington, where they are now being worked direct with Sydney under greatly improved conditions. The cost of the extensions and partial renewals of the cables will be debited to the general reserve fund in the current year's accounts.—*Financial Times*.

Eastern Telegraph Co., Ltd. The report for 1916, now issued, shows that the revenue was £2,519,283, less £707,038 for ordinary expenses and £352,905 for expenditure relating to maintenance of cables, income-tax payable abroad, and special war payments to staff and other expenses in connection with the war, leaving £1,459,340, plus £26,638 brought forward. After providing for income-tax and excess profits duty payable in England, interest on mortgage debenture stock, and preference dividends, absorbing £596,290, the balance is £889,688, out of which £500,000 has been placed to general reserve, £10,000 to insurance of war risk at stations fund, and £5,000 to insurance of goods in transit fund. The total distribution for the year 1916 is 8 per cent., free of income-tax, leaving £54,688 to carry forward. The general reserve fund has been charged with £11,951 in respect of loss on sale and redemption of investments and certain special expenditure, and with £150,000 as a further provision on account of investment fluctuations. After crediting the above £500,000, the net addition to the fund for the year is £338,049. The vacancy on the board caused by the death of Lord Allerton has been filled by the appointment of Sir R. M. Kindersley, K.B.E.

German Companies. The *Elektrotechnische Fabrik Rheindt, Max Schorch & Co., A.G., of Rheindt*, whose operations are now chiefly devoted to the production of war material, reports gross profits of £40,000 for the first half of 1917, as compared with £49,000 in the whole of last year. After making provision for depreciation, the net profits and large balance forward are returned at £45,000, as against £30,000 in 1916, the dividend being 10 per cent. for the six months, as contrasted with 15 per cent. in 1916.

The *Elektrizitäts A.G. vorm. H. Pöge, of Chemnitz*, reports a substantial increase in the turnover in 1916-17, and an advance in the net profits from £88,000 in 1915-16 to £127,000 last year. It is proposed to pay a dividend of 20 per cent., as compared with a rate of 15 per cent. in 1915-16. The share capital is to be raised by £75,000 to £300,000 for the extension of the works and the provision of additional working capital.

The *Gasglühlicht Gesellschaft (Auer), of Berlin*, records a turnover, including war materials, three times greater in 1916-17 than in the most favourable year of peace. The net

profits are £717,000, as against £500,000 in 1915-16. It is proposed to distribute 25 per cent. on ordinary shares for £396,000, as in the previous year, and 5 per cent. on preference capital for £410,000, and to devote £106,000 to the repurchase of a further block of preference shares for cancellation.

The directors of the *Kabelwerk Rheindt A.G., of Rheindt*, after appropriating only £1,100 for depreciation in 1916-17, as contrasted with £61,000 in the previous year, report net profits of £221,000, as against £184,000 in 1915-16. It is intended to pay a dividend of 20 per cent., as compared with 30 per cent., in the form of the allocation of the divisible amount to the payment of a first instalment of 50 per cent. on a proposed share capital increase by £100,000 to £350,000, whilst the remaining half will be called up at a subsequent date.

The financial statement of the *Elektrowerke A.G., of Berlin*, the ownership of which has now been transferred to the Imperial Government, shows a loss of £2,100 in 1916-17, which follows a loss of practically the same amount in the preceding year. Although the undertaking only has a share capital of £250,000, advances of a total of £2,000,000 were made by the A.E.G. and the Berlin Electricity Works Co., and the taking over of the entire undertaking by the State has been accompanied by the substitution of State directors in place of the private representatives.

The report of the *Brandenburg Carbid und Elektrizitäts Werke A.G., of Berlin*, states that the company's water powers were being fully utilised, and the steam plant had to be worked to a greater extent in order to meet the demand for energy. The working results, which apply to the year ended on March 31st, 1917, were unfavourably affected by the scarcity of labour and the difficulties in procuring supplies of raw materials. In the autumn of 1916 the sale of calcium carbide was brought under governmental control, and the prices thereby fixed left only a moderate profit. The *Norsk Elektrokemisk Aktieselskab* was again able to pay a dividend of 10 per cent. for 1916, although the water and transport conditions were unfavourable. The accounts of the *Brandenburg Co.* show net profits of £14,700, as contrasted with £14,400 in 1915-16, and a dividend of 7 per cent. is proposed, as in the previous year.

Montreal Light, Heat & Power Co., Ltd.—Dividend of 2 per cent. on the paid-up capital stock for the quarter to October 31st.

Anglo-Portuguese Telephone Co., Ltd.—Interim dividend of 3 per cent., less income-tax.

Kaministiquia Power Co.—Dividend at the rate of 7 per cent. per annum on the capital stock for the quarter to October 31st.

Fellows Magneto Co., Ltd.—The directors report that the value of the output in May was £4,384; in June, £5,350; and in July, £7,263. It is hoped that by the end of December the monthly output will exceed £14,000 in value. Additional capital expenditure since the company started trading amounts to £27,000. On August 31st the company's liquid funds amounted to £18,569. Treasury consent has been granted for a further issue of £40,000 in preferred shares, but a decision has not yet been come to as to when this issue will be made. The directors hope to be able to recommend an ordinary dividend with the final dividend on the preferred shares for the current year.

Tubes, Ltd.—The directors in their report refer with regret to the death of the chairman, Captain John Chamberlain, M.C., who was killed in France on May 14th of this year. This deplorable event made a reconstruction of the board desirable, and Mr. Arthur Chamberlain, J.P., and Mr. James Rollason, J.P., have accepted seats on the board. The directors are still unable to present the accounts for the years ended April 30th, 1916, and 1917. The shareholders will be asked to confirm the payment of the interim dividends made on December 23rd and July 25th last, which the directors are satisfied have been earned during the year ended April 30th, 1917.

Electric Supply Co. of Victoria, Ltd.—In their report for the year ended March 31st, 1917, the directors show that the lamps connected increased from 166,253 to 188,402, and the passengers carried from 4,877,325 to 4,803,895. The trading account shows a gross profit of £31,218, as against £30,702 for the previous year. The balance to credit of profit and loss account is £29,528, plus £6,433 brought forward. There has been paid for debenture interest £7,393, and transferred to debenture stock redemption account £6,892, leaving £21,677, out of which £5,250 is required to pay on account of arrears of preference dividend, and £16,427 is to be carried forward.

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers during the five weeks ended August 31st, 1917, was 2,982,020, compared with 2,616,727 units in 1916.

Brisbane Electric Tramways Investment Co., Ltd.—Interim dividend, 8 per cent. per annum (4s. per share), free of tax, on ordinary shares for the half-year.

Calcutta Tramways Co., Ltd.—Interim dividend on the ordinary shares at the rate of 2½ per cent., free of tax.

Lima Light, Power & Tramways Co.—Dividend of 1½ per cent., in Lima, on the shares.

Parsons Marine Steam Turbine Co., Ltd.—It has not been possible to complete the accounts for the year ended June 30th, 1916, nor for the year ended June 30th, 1917, but a dividend of 15 per cent., free of income-tax, payable on 17th inst., is recommended, making 25 per cent. for the year. No further dividend for the year will be declared.

National Telewriter Co., Ltd.—The report for the year ended June 30th states that the results of operations, owing to the decrease in business in consequence of the war, show a loss of £240, as compared with a profit of £1,020 for the previous year.—*Financial Times*.

Lancashire Dynamo & Motor Co., Ltd.—Dividend of 5 per cent. (actual) on the ordinary shares, free of tax.

United River Plate Telephone Co., Ltd.—Interim dividend of 3 per cent. (3s. per share) on the ordinary share capital, free of income tax, for the half-year to June 30th.

STOCKS AND SHARES.

TUESDAY EVENING.

THE strength of the investment markets continues with little abatement. The news from the Western Front is helping markets generally, and the publication of the results so far achieved with the issue of the new War Bonds is regarded with considerable satisfaction. Russian news is, of course, disappointing, although it is thought that this will have comparatively slight effect upon the course of the war. Money remains reasonably cheap. There is a strong demand for investment securities of all kinds, but some of the home railway stocks underwent a trifling reaction after their previous rises.

Metropolitan Consolidated has risen $\frac{1}{2}$ on the week, and the Deferred dividend stock hardened to 22, while there has been a little business in Surplus Lands on the basis of 48. Districts are unchanged at 16 $\frac{1}{2}$, and in the Underground issues, the Income bonds have risen to 84, the £10 shares being still quoted 1 $\frac{1}{2}$ and the 1s. shares at 6s. 3d.

Home electricity shares are as firm as ever. Bromptons rose to 6 $\frac{1}{2}$, changing hands the other day at 6 9/16, and the 7 per cent. Preference shares have been sold at 6 $\frac{1}{2}$. City of London have advanced to 13, with business at 13 1/16, but Counties at 11 show a slight fall. London Electrics, although business was marked the other day at 15s., are not offered below £1. The company's 4 per cent. First Mortgage debenture stock changed hands on Monday at 82. Metropolitans hold their rise at 3 $\frac{1}{2}$. St. James's are being dealt in round about 7, but are more easy to sell than they are to buy. In the case of the other shares, the principal difficulty is to get the offer of any reasonable quantity.

Victoria Falls Preference are being bought by the provinces, and the price shows a good deal of strength at 24s., the 5 $\frac{1}{2}$ per cent. debentures being 105 $\frac{1}{2}$, while the ordinary shares hold their previous price of 19s. South Wales Electric ordinary came to market the other day at a shilling.

In the foreign group, Anglo-Argentine Tramways first preference are down 1/16 to 3 $\frac{1}{4}$, in consequence of the gravity of the strike situation. The Argentine Government, however, is apparently bent on strong measures for suppressing the trouble, and after a spasm of acute flatness, Argentine railway stocks recovered sharply, which had a sympathetic influence upon other industrials connected with the country. Brazil Traction are a point lower at 45. There is little change from day to day in the course of the Rio exchange, and until the rate takes a distinct turn for the better, it is hardly likely that Brazilian securities will undergo improvement. Rio Tramway first mortgage bonds keep very hard, however, at 87 $\frac{1}{2}$, and there has been a little business lately in the company's 5 per cent. mortgage bonds at or about 78 $\frac{1}{2}$. Mexican issues are quiet, a little undecided it may be, but attracting scarcely any active attention for the time being. Mexican Light and Power Preferred 7 per cent. Preference was done the other day at 34; the company's deposit receipts for the bonds stand a trifle higher than the actual bonds themselves. Mexican Northern Power Gold bonds, nominally 10/11, were negotiated this week at 12 $\frac{1}{2}$, and Monterey Fives at 27. Canadian industrials remain depressed.

The telegraph list is very steady. A lot of business is being done in the Marconi issues. Eastern Extension shares were ex 3s. dividend last Thursday, and Eastern Telegraph stock ex 30s. No changes, however, have been made in the prices, and this applies also to Cuba Submarine Telegraph, the dividend in the last named being 5s. a share. Cuba 10 per cent. Preference, by the way, are quoted at 14 $\frac{1}{2}$, which is £2 lower than at the outbreak of war, although the ordinary at 8 $\frac{1}{2}$ are 5s. higher. Eastern Telegraph ordinary stock, incidentally, is 1s. points higher than it was at the end of July, 1911. Great Northern maintain their rise at 39. West India and Panama shares receded to 30s., though there is not much business doing in them. Marconis have risen to 3 $\frac{1}{2}$, but the feature

of the week is the strength and activity of the market in American Marconis about 22s. 3d. and Canadian Marconis at 12s. A strong Stock Exchange tip was circulated to buy the former on the strength of vague statements as to the remarkable prosperity which the American Marconi Co. is enjoying, and a good many speculators helped themselves to shares. A bit of a bull account in them was built up, and at 23s. 9d. shares came in freely. Canadians have been a dark market for some time past, and the rise is due to sympathy with the advance in American Marconis. Marconi Marines are very firm at 52s. 3d., and the preference shares of the parent company keep about 2 15/16.

British Insulated ordinary are the main feature of strength amongst industrials, the price putting on 15s. to 14 $\frac{1}{2}$. India-Rubbers gained 5s. to 14, and General Electrics of both classes have gone ahead, the ordinary to 17 $\frac{1}{2}$ and the preference to 10 $\frac{1}{2}$. Babcock & Wilcox have recovered to 3 $\frac{1}{2}$. Edisons are easier at 20s. 6d., interest having died out in them for the time being, and British Westinghouse preference eased off to 3.

The rubber market has been somewhat upset by a sharp break in the price of some of the Java shares, due to the situation that has arisen between this country and Holland. Moreover, the price of the material shows dulness at 2s. 7 $\frac{1}{2}$ d. per lb. Nevertheless, there is a considerable amount of business going on. Iron, coal, and steel shares are strong, and in some of the markets connected with the baser metals, more particularly for that of copper, rather more activity has developed, though without much change in prices. The Stock Exchange as a whole is actively employed, and the tone throughout the markets keeps distinctly good.

THE HIGH-TENSION MAGNETO.*

(Continued from page 335.)

The special "spark-gap" distributor is used in the type "A" magneto, and has proved to be thoroughly reliable and satisfactory. The distributor brush is made of steel, and has V grooves in its active face with a central slot for taking the square head of the locking screw. It is of rectangular section, and is free to move in a brass tube moulded into the insulation. A spring forces the brush outwards against the head of the locking screw. Obviously, the screw is automatically locked, and the air gap between the face of the brush and the track of the distributor can be readily adjusted by first depressing the brush until the head of the screw is clear and then turning the latter either one way or the other. A quarter of a turn on the screw, which gives the

FIG. 14.—THE B.T.H. TYPE A S S MAGNETO.

minimum adjustment, alters the air gap by 0.002 in. When properly adjusted, the air gap should be between .01 in. and .014 in. The amount of wear on the face of the brush after continuous use is so small as to be almost negligible.

It does not seem to be generally appreciated that the manufacture of magnetos can only be undertaken successfully if very skilled labour is available, and the necessary steps are taken to machine all the component parts to extremely fine limits. The type "A" magneto is so complicated in design that the difficulties encountered in manufacturing it on a commercial basis are, without doubt, much greater than in the case of any other type of magneto being produced in England at the present time.

Take, for example, the rotating sleeve inductor. It comprises two soft iron segments which are secured by means of screws and dowel pins to a non-magnetic nickel steel end plate and spindle on the one hand, and to a gun-metal end plate carrying the distributor gear-wheel driving pinion on the other. The whole combination has to run on three ball bearings, all of which must be in perfect alignment. The outer race of one bearing is carried by the aluminium driving

FIG. 15.—PARTS OF THE A S S MAGNETO.

end plate, whilst the inner races of the other two are securely fixed to the respective ends of the stationary armature end-plates. The clearance on each side of the sleeve inductor is only 0.006 in., and it is clear, therefore, that extraordinary precautions must be taken in manufacture to ensure that after assembly the sleeve will be perfectly free, and neither too tight nor too loose in its bearings.

In the manufacture of the type "A" magneto no fewer than 716 limit gauges are employed; 179 gauges constitute

one complete set, and four sets of gauges are in use, being allocated respectively to shop use, shop inspectors, Government inspectors, and check purposes in the tool-room. The shop gauges are made to somewhat finer limits than are specified on the drawing, so that the rejections made by the inspection department are reduced to an absolute minimum. The finer limit gauges are checked in the tool-room every day, whilst other gauges are checked periodically, the frequency of the inspection being dependent upon the degree of accuracy worked to and the liability of the gauge to wear in use. When the "go" end of a gauge (which is made somewhat larger than the minimum diameter specified) has worn down to the drawing dimension, the gauge is passed on to the inspectors for use in inspecting the work. This arrangement ensures that there is always an ample supply of very accurate gauges in the inspection department, because the wear on gauges used in the shops is much more rapid than the wear from use by the inspectors. Furthermore, each gauge has, by this method of working, a more extended life. Gauges are

FIG. 16.—ASSEMBLY OF B.T.H. 12-CYLINDER POLAR INDUCTOR TYPE MAGNETO.

withdrawn from the inspection department for very slight errors from drawing dimensions, and the cost of maintaining a large number of gauges within narrow limits of accuracy is naturally quite a considerable item.

The finest limits worked to are for the hole in the contact-breaker cam and the end of the distributor brush spindle, on which the cam is fitted. These limits are:—

Hole in cam	Maximum diameter	13.005 mm.
	Minimum diameter	12.995 mm.
	Tolerance	0.01 mm.
End of spindle	Maximum diameter	12.995 mm.
	Minimum diameter	12.988 mm.
	Tolerance	0.007 mm.

The B.T.H. Co. has recently developed a polar inductor type magneto, more especially for 12-cylinder working, although it is proposed to standardise an 8-cylinder machine of exactly the same design by simply changing the distributing mechanism and gearing. This is the first 12-cylinder magneto to be developed and standardised in this country. Several

FIG. 17.—B.T.H. POLAR INDUCTOR TYPE MAGNETO.

models have already been constructed and tested with entirely satisfactory results on engines in the test shop, as well as in the air. It is designed to give four sparks per revolution, and the 12-cylinder model runs at $1\frac{1}{2}$ times engine speed.

The basic principle embodied in this design of producing the requisite flux reversals in a stationary laminated armature circuit, by means of a rotating polar inductor co-operating with fixed permanent magnets, is a British invention made by Mr. T. B. Murray, of the Albion Motor Car Co., and first disclosed by him in patent specification No. 14,737, dated June 28th, 1906. This patent is now void.

This magneto is inherently of much simpler construction than the sleeve inductor machine, because the sleeve inductor,

* Abstract of paper read by Mr. A. P. YOUNG, A.M.I.E.E., before the AERONAUTICAL SOCIETY.

which is a very difficult part to manufacture, is replaced by a polar inductor so designed that it can be easily made, and which at the same time is a more rigid and reliable mechanical structure. Other features in the design combine greatly to simplify the manufacturing problems, and it is anticipated that, other things being equal, the output of magnetos will rise very considerably after the change over from one type to the other has been completely effected—a fact of vital importance at the present critical juncture.

A sectional view of the machine is given in fig. 16. The polar inductor consists of a "straight-through" shaft made of non-magnetic nickel steel, on to which two polar inductors are first pressed up against a shoulder, and then finally riveted in position to the shaft. The ends of the magnets are secured to two soft-iron pole-pieces, near the top of each, by means of screws. There is an extremely fine air gap between

FIG. 18.—COMPONENT PARTS OF POLAR INDUCTOR MAGNETO.

the inside face of each pole piece and the outside surface of the annular portion of the inductor which it surrounds.

The magnet flux, therefore, passes through this fine annular air gap in a radial direction, and flows from one inductor to the other through the laminated armature circuit. The armature windings are carried by a brass spool, which is secured to a laminated iron core, which, in turn, is fixed by means of two clamping screws to two upright laminated projections. These are fixed in the central casting which carries the pole pieces, and also provides the base of the machine.

The contact breaker is operated by a four-part cam fixed to the end of the driving shaft. The contact breaker lever is specially designed so as to give a very low moment of inertia, and tests have shown that it will function satisfactorily when making 16,000 breaks per minute. This frequency corresponds to a speed of 4,000 R.P.M.

The distributor is of special design, having three distinct

FIG. 19.—SPARKING VOLTAGE AND ENERGY CURVES.

tracks, two of which are the distributing tracks, each provided with six segments. The brush-holder contains five carbon brushes, and the safety gap is incorporated in the brush-holder and rotates with it. A gauze window is provided in the front of the distributor, and in consequence of the rotation of the brush-holder any products of ionisation have an easy chance of escape. This arrangement is much to be preferred to a totally enclosed stationary type of safety gap, where the silent brush discharge is always liable to produce injurious results.

A good idea of the general appearance of this magneto can be formed by referring to fig. 17, which gives an outside view of the machine, while the component parts are clearly depicted in fig. 18.

The magneto possesses excellent sparking characteristics at low speeds, as shown by the curve in fig. 19, which has been plotted from results of an actual test. The energy output, although not abnormally high, is very satisfactory for an inductor-type magneto. The curve plotted from the figures obtained by a calorimeter test is also given in fig. 19.

It should be noted that the maximum energy output, which is reached at a speed of about 800 R.P.M., is as large as .072 joule.

Special precautions have been taken in the design of the

magnetic circuit as well as in the choice of suitable magnetic material to ensure that the effect of eddy-current damping is reduced to an absolute minimum. As a result of this, the falling-off in the energy output as the speed is increased beyond the maximum point on the curve is not very marked, and for the sake of comparison curve 3 (shown dotted), which has been plotted from the figures obtained on testing a 12-cylinder polar inductor-type magneto of American manufacture, is added. In this case the effect of eddy-current damping at high speeds is very pronounced indeed, and the energy output, which reaches a maximum of .065 joule at about 800 R.P.M., falls away to only .015 joule at 3,000 R.P.M. There is no doubt that by paying more careful attention to the design of the magnetic circuit as referred to above the characteristic of this particular magneto, so far as energy output is concerned, could be improved.

Fig. 20 shows two curves, one giving the variation in the open-circuit primary voltage (R.M.S. value) with the speed and the other the variation in the short-circuit primary-current

FIG. 20.—SHORT-CIRCUIT CURRENT AND OPEN-CIRCUIT VOLTAGE CURVES.

(R.M.S. value) corresponding to the same range of speed. The open-circuit voltage curve is practically a straight line passing through the origin, which confirms the view that the eddy-current damping in the magnetic circuit is extremely small. With most types of magnetos the open-circuit primary-voltage curve shows a distinct drop with increase in speed, due to the fact that the active armature core flux diminishes as the speed is raised. This drop is fairly pronounced in the case of the sleeve inductor-type magneto already described, as shown by the open-circuit voltage curve given in fig. 11.

The short-circuit current, on the other hand, remains substantially constant for all speeds above about 600 R.P.M., and this test, in which the magneto is run with the primary short-circuited through an ammeter of negligible resistance, is analogous to the case of an alternator running on short circuit. Every electrical engineer knows that in the latter case the short-circuit current is practically independent of the speed, due to the fact that the induced E.M.F. in the short-circuited winding varies in almost strict proportion to the reactance of the winding.

The primary voltage kick at the instant of "break" was determined at different speeds by using a Kenotron in conformity with the method of testing previously referred to. The voltage increased with the speed up to 3,000 R.P.M., very rapidly at first, but not so rapidly at very high speeds. Abnormally high voltages were measured, these being considerably in excess of any figures that the author has been able to obtain by testing in the same manner any rotating armature type of magneto. When the ratio between the primary and secondary turns is taken into consideration, one is led to the conclusion that at the instant when the high-tension spark is initiated an abnormally high voltage is induced in the secondary, this voltage being greatly in excess of any figure that has been previously assumed.

The input, output, and efficiency curves are given in fig. 21. The input curve has been plotted from the values of the power

FIG. 21.—INPUT, OUTPUT, AND EFFICIENCY CURVES.

required to drive the magneto at different speeds as measured by an electrical method, while the output curve is calculated from the spark energy curve given in fig. 19. The efficiency curve has been calculated in the usual manner, and is substantially in agreement with the curve for the type "A" magneto given in fig. 13.

(To be continued.)

A MAGNETIC STEEL BAND DRIVE.

By P. L. WESTON.

(Abstract of paper read before the ELECTRICAL ASSOCIATION OF AUSTRALIA, N.E.W. SECTION.)

EXPERIMENTS made by the author in 1908 showed that magnetic pulleys could be devised which would efficiently attract steel bands as thin as 0.03 in. In 1916 he resumed the experiments, and found that good magnetic adhesion could be obtained with band thicknesses of 0.015 in. and upwards. The pulleys were 9 in. in diameter, and contained a single magnetic circuit, formed by two disks 25 mils thick with a winding space 1.75 in. deep and 40 mils wide, the current being led in through slip-rings. The total face of the pulley was 90 mils wide, and brass cheeks were provided. The band was $\frac{1}{2}$ in. wide and 15 mils thick. The pulley centres were 20 in. apart, and the pulleys were run at 1,500 R.P.M. for 300 hours, with a net difference of tensions of 20 lb. Slip took place when the difference of tensions was 45 to 50 lb., with 60 ampere-turns excitation, representing 5 watts for each pulley, and the tension in the slack side practically zero. The coefficient of friction was 0.265, and there was no appreciable wear on the band or pulleys. Up to 47 lb. difference of tensions the measured slip was almost identical with the normal calculated creep of the band due to stretching of the driving side of the band.

In another experiment, driving from a 10-in. pulley on a steam turbine to a 27-in. pulley at 29-in. centres, width of active face of pulley 80 mils, a band $\frac{1}{2}$ in. wide and 20 mils thick transmitted up to 20 H.P. at a turbine speed of 4,200 R.P.M., corresponding to a difference of tensions of 60 lb. The excitation of the small pulley was 50 ampere-turns, and that of the large pulley 12, the total power consumed being 25 watts.

The author discusses the theory of the drive, and shows for a 15-mil band on a 10-in. pulley, with an arc of contact of 150 deg., and a slack side tension of 50 lb., the maximum difference of tensions will be about 400 lb. A normal working value would be 250 lb., making the bending stress 45,000

FIG. 1.—SECTION OF STRIP.

FIG. 2.—SECTION OF MAGNETIC PULLEY.

lb. per sq. in., and the direct stress 20,000 lb. per sq. in. Advantages are gained by using thicker bands. For bands of ordinary band-saw steel with silver-soldered joints, if the ratio of band thicknesses to pulley diameter does not exceed 1/1,000, a life of many millions of bends may be expected. For a 24-ft. band at a band speed of 10,000 ft. per minute, 40 million bends over the smaller pulley represent 1,600 hours' running; such a band 1 in. wide would transmit 50 B.H.P., and would cost, say, 10s., so that on a life of 1,000 hours the cost of band renewals would be insignificant, while power would be saved owing to the unusually high efficiency of the drive. The satisfactory endurance of band-saws with ordinary silver-soldered joints under very strenuous conditions leaves no doubt as to the endurance of similar steel bands for power purposes. For very high-class drives welded bands, or endless bands rolled from a solid ring of steel, might be worth while, and probably the best material would be an alloy such as chrome vanadium spring steel, which would have an extremely high elastic limit when rolled in such thin sections and suitably tempered.

For the smaller pulley of a combination the construction adopted is virtually a double-threaded screw with rectangular threads of small pitch and relatively deep grooves, as shown in section in fig. 2. This construction could be readily made up of two helices of iron strip, of the section shown in fig. 1, rolled in conical rolls to the required pulley radius, and riveted together to form the pulley rim. In general, the pole thickness will be from twice to two and a half times the band thickness, and the winding spaces can be 40 to 50 mils wide and 0.7 to 1.5 in. deep. With these proportions 60 ampere-turns will usually give sufficient excitation, and the magnetising watts amount only to a small fraction of 1 per cent. of the power transmitted. For the larger pulley of a combination, owing to the longer arc of contact, the magnetic circuits can either be reduced in strength or more widely spaced. Fig. 3 shows a design in which the active poles are narrow zones of one polarity formed of iron disks or segments, alternating with wide zones of the opposite polarity. To increase the width of both N and S pole faces is inefficient, since the adhesion varies as the square of the

flux density, and hence good attraction is secured only if the density of flux in the pole face is fairly high.

In a suitable design the sum of magnetising watts and the loss due to creep can be generally made from .2 to .5 per cent. of the transmitted power. Other losses comprise windage, hysteresis, and eddy currents, and increased friction of bearings. Hysteresis and eddy-current losses are found to be very small, and the remaining losses are almost negligible. It can be concluded, then, that an overall efficiency of well over 99 per cent. can be obtained, and 99.5 per cent. seems quite attainable.

Owing to the extremely small values of the slip, the rate of wear can only be quite small, as proved by test.

The band speed in general should be kept as high as possible, subject to the limitations of safe pulley design, to resist centrifugal force. At speeds over 10,000 ft. per minute for pulleys of small diameter, and above 15,000 ft. per minute for larger pulleys, the effect of centrifugal force in the band may have to be considered.

In the Bloesser drive, steel bands from 1 to 8 in. wide are run on cork-faced pulleys. The conditions laid down for successful working are (1) that the initial tension is to be as high as possible, without overstraining the band; and (2) that the pulley diameters are to be as large as possible.

The cork face is stated to give a value of $\mu = 0.28$, while a bare cast-iron pulley at first gave a value of 0.27, but afterwards was stated to become polished and gave a lower value. This polishing effect has not yet been found by the author in any of his tests to lower the value of μ .

While the Bloesser drive appeared to give in suitable cases very good results as regards capacity and efficiency, it seems to have failed in the matter of durability, being handicapped by a mechanical joint, which is bound to introduce local bending stress in the region of the joint where fracture will eventually occur. The only patentable part of this drive seems to be the joint, so it is obvious why the promoters of

FIG. 3.—SECTION OF LARGER PULLEY.

this drive did not discard a mechanical joint in favour of the well-tried band-saw joint, which has the great merit of preserving the uniform section of the band.

While the magnetic drive appears to have a very large scope of application, it is particularly suited to deal with a difficult class of heavy drives in which a fluctuating load has to be transmitted with a large reduction ratio. A typical example would be a large ammonia compressor, driven by a gas engine or electric motor. Take, for example, a 250-H.P. drive of this nature, for which, at present, rope driving would be the most frequent practice. Using 1½-in. ropes, the usual rule of 30 diameters for the minimum size of pulley makes the smaller pulley not less than 45 in. Now, on a 45-in. magnetic pulley an 18 gauge band, 2 in. wide, will comfortably transmit the load at a linear speed of 5,000 ft. per minute. For the same speed and pulley diameters four 1½-in. ropes, or a 21-in. double leather belt, would be required. The band would effect a saving on the length of drive of about 18 ft., and about 13 H.P. of losses as compared with the belt, and about 26 H.P. as compared with the rope drive.

In general, the large capacity, high efficiency, adaptability to high speeds and short centres, low first cost, and small slip of the band drive will suggest numerous applications of this form of transmission.

A number of problems in connection with this drive require investigation, and further tests are in progress. One interesting development is that by means of a simple attachment for measuring the creep of the band the power transmitted can be accurately ascertained.

Magneto v. Battery Ignition for Petrol Motor Vehicles.—It is interesting to learn from New York that, following a period in which battery ignition in conjunction with electric lighting and engine-starting sets has been so popular in motor-car manufacturing circles in the United States, there is now apparently a reversal of technical opinion on the subject, and present tendencies indicate a return to greater popularity of a separate magneto for ignition purposes.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

FRANCE AND ALGERIA.—In pursuance of an agreement between the British and the French Governments, licences will be issued by the French Customs Office in London, upon application by the exporter in this country, for the importation into France and Algeria of goods of British production or manufacture which are included in the list of articles prohibited to be imported into those countries, with the exception of (a) goods included in List 3, published with the Decree of April 13th, and subsequently amended by the Decree of May 12th (c.f. the ELECTRICAL REVIEW of June 1st), which are placed under the control of the Inter-Departmental Commission on Metals and Munitions of War; and (b) certain specified goods (textiles, soap, oils, &c.).

In the case of goods falling under (a) and (b), applications for import licences must be made by the importers in France and Algeria to the competent French authorities, and information on the subject can be obtained by British exporters from the Board of Trade Office in Paris, No. 10, Place Edouard VII.

The following procedure has been laid down for the issue of French import licences in London for "prohibited" goods not of the excepted classes:—

The application for a licence must be drawn up strictly in accordance with the prescribed form, and be forwarded in triplicate *direct* to the French Customs Office, Bank Buildings, Kingsway, London, W.C. 2. To one of the three copies must be attached a separate certificate, signed on behalf of the Chamber of Commerce of the district or town in which the merchant concerned carries on his business, and attesting that the goods are the produce or manufacture of the United Kingdom.

[A copy of the prescribed form of application, and a suggested form of certificate of origin, were published in the *Board of Trade Journal* for September 13th. It should be borne in mind that the arrangements referred to above in no way affect the necessity of obtaining a British export licence in respect of such articles as are prohibited to be exported to those countries.]

A new Decree has been issued, which contains a re-classification of goods for the purposes of import prohibitions. Goods are now divided into seven categories, called respectively Lists A, B, C, D, E, F, and G. List A consists of those goods which are admitted without licence. In Lists B to G the goods are classified according to the authorities which are to advise as to the issue of import licences. The text of the various Lists may be consulted at the Department of Commercial Intelligence, 73, Basinghall Street, E.C. 2.

UNITED STATES OF AMERICA.—According to a Treasury Circular, trade samples intended solely for use in soliciting orders for goods may now be imported by ordinary mail in unsealed parcels, which, however, must be plainly marked abroad with the words "Trade samples of," subject to examination by United States Customs Officers. Samples sent on approval may not be sent in this way.

The exportation (except under licence) of various classes of goods has been prohibited by Proclamation. The list of goods includes wireless apparatus, electrical equipment, copper, lead, tin, nickel, aluminium, zinc, plumbago, and platinum.

ITALY.—The Italian Government has recently taken steps to terminate at the end of this year the various Treaties with foreign countries which fix rates of duty on certain classes of goods, thus leaving the Government free to revise the Tariff as may be found desirable. This revision has been under consideration by a Royal Commission, which is to present its report very shortly. The Commission has already issued important recommendations, which include the adoption of a double Customs Tariff, one with heavy duties on the goods of countries not granting favourable treatment to Italy, and the other with more moderate duties for goods of other countries. Anti-dumping legislation is recommended, and it is also suggested that the Customs *regime* of the Italian Colonies should be determined by special regulations.

NEW PATENTS APPLIED FOR, 1917.

AN INSTITUTE FOR DISCOVERIES AND INVENTIONS.

"The ideas of inventors," says *E.T.Z.*, "represent not the least interest on the capital formed by a people's spirit of enterprise, and an Institute for Discoveries and Inventions is an economic necessity." During the war, all the principal countries concerned have arranged to make full use of ideas submitted to a central committee, and to analyse and develop these, however unpromising they may appear in their original forms. What is needed is a permanent organisation to render similar service to the nation after the war. The raw materials section of the German War Ministry has been established as a permanent authority, and therein *E.T.Z.* sees the modest beginnings of an "Economic General Staff," which will organise and control a comprehensive scheme of economic mobilisation.

The Kaiser Wilhelm Gesellschaft, the Material-prüfungsamt (for testing materials), and the research departments of colleges and large firms are milestones on the path of technical progress. The Jubilee Foundation of German industry and the Bach Foundation for technical and scientific research are only a couple of examples of the rich resources available. The standing committee of the German Union for developing foreign trade, and securing the interests of industry and commerce in the central administration of Germany, deals with concurrent problems. A promising commencement in the utilisation of experience, ideas, and observations is to be seen in the fact that the staff of the War Department is acting as an exchange, and that the chairman of the German Union of Technical and Scientific Associations has arranged for interchange of views and requirements between industrial technical interests, and the scientific laboratories of the colleges.

The basis of the proposed *Erfindungsinstitut* includes statutory organisation and the support of the principal professional institutions. Ideas and proposals submitted to the new Institute would be examined carefully, developed as far as possible in laboratories (new or existing), and then distributed to and utilised by the industries concerned. A due proportion of net profit would be reserved to the original inventor. The end in view is intelligent fusion on a broad social basis of the functions of private concerns for developing patents, and the ideals of a State department serving the common weal.

What has already been done along these lines in this country is known to our readers so far as it is wise to publish details during the war. There is still room for further advance and improvement, but we have already done much in the way of Imperialising raw materials and developing industrial research and manufacture. Such movements have been prosecuted at least as vigorously in our Oversea Dominions as at home. The achievements of peaceful industrial research in the U.S.A. have been worthily continued and extended in the war organisation of that country. Committees for war industry did sterling service in sifting and developing inventions in Petrograd and Moscow before the revolution, and it is to be hoped that their activities will be extended further during the war, and continued thereafter to the benefit of Russian industrial and economic development.

A Commission of the Académie des Sciences is agitating for the immediate establishment of a

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

national laboratory of physics and mechanics to serve home industries by research work and by developing inventions. Finland, Sweden, and Switzerland are displaying similar activity and enterprise; and for the same general purposes Japan has founded the Rikagaku Kenkyusho Institute with £196,000 capital and an annual State subsidy of £2,450. In Vienna the Technical Research Department is working with good results, and there are "a number of new, specifically Austrian organisations" as well.

Germany reckons upon "the sort of Chinese Wall, which has been placed round all the great Powers by the war, being dissolved by the resumption of international traffic after peace is declared. Wise domestic transition policy will prepare for this change. Commercial treaties, patent laws, and economic measures will need reconstructing, and the spirit of invention must be kept mobile." An institute for discoveries and inventions should certainly be regarded as an economic necessity by every great Power from now onwards, but, as for the rest, the deeds and lessons of the war cannot lightly be forgotten, and Germany is likely to find that the Allies' Wall is long, high, and durable.

The Gas-driven Car. THE recent demonstration, in London, of motor vehicles equipped for operation on coal gas is a striking tribute to the efficacy of a little vigorous pushing of even an undesirable thing. There were present, according to the *Westminster Gazette*, "motor cycles with canopy-like tops filled with domestic gas, a lorry for heavy haulage whose overhead envelope took the form of a miniature Zeppelin, and a private motor car whose seven-shillings' worth of gas was carried separately in a bulky container on a special trailer hooked on to the rear of the vehicle; a converted eight-seater Ford carried its charge of gas compressed in cylinders on the side running boards, while to a lordly landaulet was tacked on a single-wheel auto-trailer with a nest of gas cylinders." Needless to add, these excrescences have come about solely owing to the shortage of motor spirit and the dire necessity for finding some substitute fuel for internal-combustion engined cars. But, though we regard the coal-gas driven car and its attendant paraphernalia as a makeshift, it is evident that some motoring circles attach considerable importance to future possibilities in this direction, no doubt having in mind a probable shortage of liquid fuel for some years to come, and it is, therefore, of interest to examine the present possibilities of this development, which has received the blessing of certain motoring contemporaries, who, incidentally, have in the past extended a none too friendly hand to the battery-driven vehicle.

From published data it would appear that a gas-bag capacity of 450 to 500 cu. ft. is the practical limit for vehicles of the 'bus type, and this represents about 14 miles running, while a taxi-cab is assumed to carry 120 cu. ft. and travel 10 miles, so that liberal gas-charging facilities would be a *sine qua non*. There is the alternative of using compressed gas, though the stability of coal-gas under considerable pressure has to be considered, and steel containers are both weighty and expensive, even if obtainable, while an experimental rubber container measuring 4 ft. 6 in. by 1 ft. 3 in., for 1,800 lb. pressure, contains only a normal 500 cu. ft. of gas, equivalent to, say, from 14 to 40 miles' running on the basis already mentioned. Moreover, unless the car engine can be adapted to work a compressor, independent charging apparatus would be required, considerable expense being involved either way.

We have laid stress on the limited mileages which attach to the use of coal gas for vehicle propulsion, because it is precisely on this point that our motor-

ing contemporaries have in the past condemned the electric vehicle—which, whatever its limitations, has never suffered from such a severe mileage handicap as the coal-gas driven vehicle apparently will. The electric vehicle with a normal commercial range of 40 to 60 miles on one charge, and the proved capability of increasing this distance to 100 miles without introducing abnormal constructional features, not to mention its use of still cheaper fuel—roughly one-third cheaper, is obviously far ahead of the new "hybrid" which our motoring friends are so assiduously cultivating.

Mechanical traction is an indispensable factor of the present day, but, under existing conditions, the petrol engine is a millstone round the necks of those who depend on spirituous fuel, and if they use gas in its stead it is a case of "needs must when the devil drives."

ALTHOUGH the term "Lumen" has been adopted by the leading manufacturers of Great Britain—as well as of the United States and Canada—for rating the luminous output of a lamp, in place of the candle-power (which, in point of fact, in no way measures the output), like all such innovations, it may present some difficulties to those who are not familiar with its nature and origin. It may be helpful to electrical readers to point out the analogy which exists between it and the flux from a magnetic pole.

The intensity of the magnetic field near the pole of a long straight magnet of given strength varies in magnitude inversely as the square of the distance from the pole, and the direction of the magnetic force varies from point to point; similarly, the intensity of illumination due to a lamp of given candle-power varies inversely as the square of the distance from the lamp, and the direction of the light-rays varies from point to point. But in most practical applications of magnets, it is not the intensity of the field or the direction of the force that is of importance—the quantity which it is usually necessary to know is the total magnetic flux proceeding from the pole in whatever direction, and this is equal to the strength of pole multiplied by 4π . In the same way, the important quantity in the case of a lamp is not its candle-power in a given direction, but the total amount of light which it produces; and this is similarly obtained by multiplying the mean value of the candle-power in all directions (*i.e.*, the mean spherical candle-power) by 4π . The result in the former case is the number of lines of force proceeding from the magnet pole; in the latter, the number of lumens generated by the lamp. The dynamo designer has no use for the "strength of pole" in his machines; he never gives it a thought—and, similarly, the illuminating engineer is not concerned with the candle-power of the lamps that he uses. What he wants to know is *how much light* a lamp gives out; the candle-power is no guide to this quantity, but the rating in lumens gives it to him at once, and without any calculation or guess-work.

In the same way, the old expression "watts per candle" was an illusory means of expressing the efficiency (or, more correctly, the "inefficiency") of a lamp, depending as it did upon the type of lamp and the mode of measurement; the rating in "lumens per watt," on the other hand, is a true criterion of efficiency, and is independent of the method of measurement. The lumen is the amount of light which will illuminate 1 sq. ft. of surface to the intensity of 1 ft.-candle; knowing the area to be illuminated, and the intensity of illumination desired, the number of lumens required, and hence the number of lamps of a given pattern, is at once obtained in the simplest possible way—namely, by multiplying the two factors together.

A *National Nitrate Industry*.—The preliminary to establishing synthetic manufacture of nitrates on a national scale, is careful, but not prolonged, investigation to ascertain which processes are best adapted to local circumstances of the various plants proposed. What is needed is a preliminary research carried out with the same energy as it is proposed to devote to the later industrial developments, and with an expenditure of money proportioned to the magnitude

* *Scientific American*, pp. 394, *et seq.*, April, 1917.

of the interests at stake. The line of procedure suggested by Norton, though applying primarily to American conditions, is worthy of our consideration. The first step is to decide to what extent we can dispense with hydro-electric power and utilise coal refuse, peat, or even power from our largest central stations of normal type. Where cheap water power is available (as in certain of our Colonies), its possibilities should be investigated. *

Experimental plant should be laid down as follows:—

(1) A 5,000-h.p. unit to test the new Rankin arc process. (2) A unit adequate to determine the acid yield and production costs of the Ostwald process (which was refused a patent in Germany on the ground that all the essential facts were already known). (3) A plant adequate to determine the cost of Haber's synthetic process for the manufacture of ammonia from hydrogen and nitrogen. (4) Norton proposes an experimental Mond plant of 5,000 h.p. operating on cheap or waste coal: another dealing with 500 tons per day of lignites: and a third for utilising peat on a large scale. These experimental plants would hardly be required in this country, the Mond plant and its costs being well known.

Probably in every country it would pay to use more than one process: thus Norton suggests that the arc process might be best in the North-West (U.S.A.), whilst the oxidation of ammonia to nitric acid might be cheaper on the Atlantic seaboard. In a remote district where coal is cheap, the best practice might be to obtain ammonia by the Mond process, use the power gas to fix atmospheric nitrogen by the arc process, and obtain ammonium nitrate as final product, which, owing to its high nitrogen content, is economical for long-distance transport. All the fixation processes at present in industrial use are likely to remain so, and to extend in application according to local circumstances. Further progress will be made, but the general problem of fixing nitrogen from that inexhaustible reservoir, the atmosphere, is already solved, and the supremacy of synthetic manufacture over natural supplies of nitrate is already asserted.

Whatever the details of practice and organisation, we should be able to supply from within our own borders a peace-demand for nitrates far greater than our consumption in the past, and there should be plant available "capable of vastly increasing, at a day's notice, the current output of nitric acid, to meet the nation's needs in case of sudden danger."

Over-population of the world—a contingency which has troubled many people, however unnecessarily—is practically impossible now that unlimited quantities of atmospheric nitrogen can be fixed to meet the needs of intensive agriculture. An abundant supply of synthetic nitrogen compounds, made within our own frontiers, means an assured supply of explosives and security against starvation in war time. Heavier crops may be obtained with less labour where nitrogenous fertilisers are used liberally. Finally, a national nitrate industry provides profitable investment for capital and labour, benefits industry and agriculture by its products, and improves the balance of trade by substituting home production for importation.

INDUCTIVE AND ELECTROSTATIC TROUBLES ARISING FROM A.C. RAILWAYS.

[COMMUNICATED.]

IN one respect at least alternating-current traction systems are more troublesome than direct-current systems. All power circuits are liable to interfere with the proper working of telegraphs and telephones, but experience shows that nothing is more likely to produce trouble of this sort than single-phase railways. Inductive and capacity effects have in some cases led to considerable inconvenience, especially on the Continent of Europe and in America, where single-

phase lines are more numerous than in this country. The inductive effect arises from the current in the power wires, and is proportional to the strength of this current, and, therefore, varies with the number of trains that are running on the system. The current, being alternating, produces a varying magnetic field which, in cutting neighbouring telegraph and telephone wires, induces a voltage in them. Obviously the nearer the communication wires are to the power wires the greater does this voltage become. All inductive effects, however, would be eliminated if it were possible to arrange for the currents in the outgoing and return conductors of the railway system to influence the telegraph and telephone lines equally, for as the directions of the currents are opposite the induced voltages would neutralise one another. It is owing to the outgoing and return conductors of single-phase railways being in widely different positions that the inductive effects are far more troublesome than those set up by ordinary power circuits.

Experience shows that the noises produced in telephone receivers arise almost wholly from the harmonic voltages and currents of the power system. This is due chiefly to the fact that the frequencies of the harmonics generally present in the voltages and currents of power systems cover a considerable portion of the voice frequencies, particularly those frequencies at which telephone instruments and the human ear are of maximum sensibility. Extraneous currents of frequencies approaching the average voice frequency have a more injurious effect upon telephone conversation than currents of lower frequencies. The effect of induction arising from the fundamental frequency is comparatively unimportant so far as telephones are concerned.

Interference on telegraph and other signalling circuits, however, is due principally to the fundamental and lower harmonics. Telegraph receiving instruments are relatively insensitive as compared with the telephone, to the higher harmonics, but are sensitive to disturbances by the lower frequencies, such as the fundamental and lower harmonics, which more nearly approach the normal operating frequency of such circuits. From the point of view of telephonic communication, therefore, it is very desirable that every endeavour should be made to employ generators that give as far as possible pure sine voltage waves. There seems to be little doubt that if generators could be designed to give absolutely pure sine voltage waves and without ripples, the interference with telephone speech would be reduced to an insignificant amount.

Among many other single-phase railways that have interfered considerably with the working of neighbouring telephones is the Rjukan Railway in the South of Norway. The telephone lines are supported on ordinary insulators, and are interlaced. Some of the telephone wires are only 3 metres away from the track, and, owing to the fact that this portion of the line passes through a forest, it was impossible to place them in a more favourable position. When the locomotives were put into service the ringing apparatus was found to be very sensitive to the 15-cycle current, and, notwithstanding that the slots in the motors were skewed, and that the specification stated that the generators were to be designed so that no harmonic should exceed 4 per cent. of the fundamental, serious troubles in connection with the telephones were experienced. The starting of the locomotives produced noises in the telephone receivers, and these noises became more pronounced when the locomotives were running at full speed. In some cases it was impossible to use the telephones at all. Investigation showed that the trouble was caused by tooth pulsations in the generators. The harmonic in the pressure wave, mainly responsible for the trouble, was found to have a frequency of 568 cycles per second, and the difficulty was overcome, or, at any rate, considerably diminished, by connecting a resonance circuit across the generators, the object being to provide a path for the high-frequency current, so that no current at this frequency could exist in the overhead line. Experiments showed that a resonance circuit having a capacity of .2 microfarad and an inductance of .4 henry gave the best results. The current in the resonance circuit was found to be only .36 ampere, indicating that the alternators had high resistance.

Resonance shunts have been employed to eliminate the effects of induced voltage on telegraph circuits. In this

* The cheapest site Norton has located in the States is one capable of yielding 150,000 h.p. at £1 5s. per h.p.-year *cf.* 8s. 4d. in Iceland; 8s. to 20s. in Norway; £2 5s. at Niagara on the Canadian side, and £1 1s. on the American side.

case, however, the shunts are connected to the telegraph circuits themselves, and not to the alternating-current power circuit. The shunt provides a path of low resistance for alternating currents of the frequency for which it is designed, but affords no path for the direct current which operates the circuit. With the aid of these shunts it has been found possible to make certain signalling circuits workable that were previously unworkable; although at high speeds the signals are liable to be distorted as a result of the shunt coming into action, and so providing a path for the working current.

Besides the induced currents, earth currents from the track rails are also liable to lead to trouble, but these currents are more easily dealt with. On the Brighton line somewhat elaborate precautions have been taken to minimise these currents, and also the effects of electromagnetic induction originating from the contact wires. In view of the fact that the electrolytic effects arising from alternating currents are less troublesome than those attributable to direct currents, the Board of Trade fixed the maximum permissible drop in the return circuit at 20 volts instead of 7 volts, as allowed for direct-current systems. Special steps were, therefore, taken to assist the current to return to the generating station. Two conductors have been employed in conjunction with the return circuit. On the lines that were first electrified—those between Victoria and London Bridge—each rail length was connected to one of these conductors; but on later extensions the rails have been bonded together, and connection has been made to the cable at wider intervals. The other return conductor is connected at a few points with the conductor which is connected to the rails. In series with this second cable the secondaries of boosting transformers are connected, the primaries of these transformers carrying a portion of the main current. The effect of these transformers, which have a ratio of 1 to 1, is to cause the current to return by way of the booster cable. Leakage from the rails to earth is, therefore, eliminated. Tests have shown that little of the current returns through the rails or the first-mentioned cable that is connected to them, nearly the whole of the current coming back by way of the booster cable.

What influences to a marked degree the inductive effects arising from the current in overhead conductors is the manner in which the lines are fed. If the lines are energised at one end of the system so that telegraph and telephone lines are exposed to the influence of long lengths of contact wire carrying current in the same direction, then electromagnetic and electrostatic influences are likely to become very troublesome. As on the Brighton Railway, the lines should be sectionalised and fed at various points, so that the current traverses the wires in opposite directions, and so tends to neutralise the induced voltages. A railway on which the telegraph and telephone circuits have been considerably interfered with is the New York, New Haven, and Hartford line. Originally the simplest possible layout was adopted, the current being fed into the contact wire from a single generating station in such a way that telegraph and telephone wires were exposed to the influence of long stretches of high-tension lines carrying currents flowing in the same direction. Some time ago, however, a new method of feeding the line was adopted, with distinctly beneficial results; in fact, it is said that the new arrangement has completely overcome all difficulties. The new feeding system was adopted partly with a view to raising the transmission pressure and partly to eliminate telephone troubles.

Current is supplied from the generating station through transformers at a pressure of 22,000 volts, but the trains are supplied with current at only half this pressure. The middle points of the secondaries of the 22,000-volt transformers are connected to the rails, and one of the outer ends of each transformer to the overhead conductors; hence the pressure between the contact wires and rails is 11,000 volts. The other end of the secondary winding on each transformer is connected to feeders running at the side of the track. About every two miles along the track auto-transformers are connected between the trolley wires and feeders, and the centre points of these auto-transformers are connected to the rails. Hence, when a train is in a section between two auto-transformers, the current will flow in opposite directions

and the division of current on the two sides of the train will depend upon the position in which the train stands. The unbalanced currents flowing in opposite directions greatly minimise inductive influences; and, further, the length of contact line influencing the telegraph and telephone circuits is considerably reduced.

If a train is situated nearer to one auto-transformer than another, it will draw the greater part of its current from the nearer transformer, and the smaller portion from the more distant transformer. But the net result is the same in each case, for the larger current multiplied by the shorter distance is balanced by the smaller current multiplied by the longer distance.

Use has been made in some cases of neutralising transformers as invented in the first place by Mr. Chas. F. Scott, but these transformers do not eliminate the noise set up in telephone receivers resulting from the harmonic frequencies. In its present stage of development the neutralising transformer has multiple primary and secondary windings connected in series with the line wires of the disturbed telephone system. The multiple primary windings are associated with a group of telephone circuits known as "primary wires," which are earthed at or near the geographical limits of the disturbing zone. These earth connections complete a low-impedance circuit for the induced currents in the primary wires, and cause them to magnetise the transformer core. By virtue of the transformer action electromotive forces are induced in the secondary windings, and by proper connection of the secondary windings with the telegraph and telephone wires, which are called "secondary wires," these electromotive forces are made to oppose and reduce the voltages induced in these wires by the disturbing electric system. On account of the choking action of the transformer primaries part of the voltage (90 per cent. or more) induced in the primary wires acts as an exciting electromotive force for the transformer primary winding, so that the difference of potential between the ends of the primary wires is reduced by approximately this amount. The use of these neutralising transformers, however, will not by any means eliminate all noise disturbances, for they only reduce the voltages induced in telegraph and telephone lines, by currents at the fundamental frequency. Moreover, residual voltages are always left in the wires, and if the induction is very severe, these voltages may be great enough to interfere with the telegraph service. Theoretically, the neutralising transformer has possibilities in the direction of reducing some noise troubles, but practical experience seems to indicate that they are not of much use in this connection. Generally speaking, it may be said that, while neutralising transformers provide means for greatly reducing moderate amounts of low-frequency induction, the limitations and disadvantages of such transformers prevent their constituting a primary protection against inductive interferences. Hence it is necessary in the case of alternating-current railways to work out carefully the methods of distributing power to the trains, so that inductive disturbances are prevented as far as possible.

Electrostatic effects have not, on the whole, proved nearly so troublesome as electromagnetic effects; in fact, on some railways the adjacent telegraph and telephone lines have not been charged at all. Much seems to depend upon the construction of the railway. If, for instance, there are many earthed steel structures, as on the Brighton Railway, the telegraph and telephone lines are shielded, and no electrostatic troubles arise. Like electromagnetic induction, electrostatic induction varies with the frequency of the current in the contact wires. Electromagnetic induction, as already stated, varies with the current, whilst electrostatic induction is independent of the current but is dependent on the voltage. Any drop produced by the current will, of course, reduce the electrostatic effect. One method of getting rid of electrostatic voltages, which has been adopted on the Rjukan Railway, for instance, is to employ discharge coils. The coils used on the Rjukan line have a resistance of 750 ohms. They are connected across the double telephone lines at distances of 2 km., and the middle point of each coil is earthed.

No electrostatic disturbances have been met with on the Brighton lines, but on the single-phase section of the Midland Railway (the Lancaster, Morecambe, Heysham

section) both electromagnetic and electrostatic effects have been observed.

On this railway wooden supports are used for carrying the contact wires, and this probably accounts for the electrostatic effects being more pronounced than those experienced on railways using steel structures. Electrostatic effects were considerably reduced by erecting an earth wire between the power wires and the telegraph wires parallel with the track. The telegraph lines have also been earthed through resistances.

No doubt in time to come other methods will be found for dealing with these telegraph and telephone difficulties. On some of the Continental lines the inductive effects have been very troublesome indeed, and have only been overcome after shifting the wires well away from the power circuits. The method of feeding the contact wires is undoubtedly the main point that demands consideration when designing single-phase traction systems, and if proper attention be paid to this matter, a good deal of the trouble associated with telegraph and telephone circuits can be avoided.

MAGNETO FLASH LAMPS.

THE development of metallic filaments has extended enormously the use of small and medium-sized electric lamps, as well as those of higher candle-power. The demand for very small lamps (such as "flash lamps") is reckoned in millions, and to provide current for these there has grown up a distinct and important branch of the electrical industry, manufacturing small primary batteries and storage cells. The latter are capable of yielding a suitable current for a long period, but the cells themselves are heavy, the use of acid in "pocket lamps" is objectionable, and the necessity for periodical recharging involves delay (or duplicate batteries), and limits the use of the lamp to within easy distance of charging facilities. The use of storage cells is best restricted at present to comparatively large semi-portable sets (for bedroom lighting and similar service), and to cases such as that of miners' lamps, for which proper provision can be made for recharging at frequent, regular intervals. For ordinary flash-lamp service dry batteries offer the advantages of light weight and independence of current supply for recharging purposes. There, however, the advantage of the dry battery ends. There have been extraordinary improvements in the manufacture of small dry cells, but nothing can alter the facts:—(1) That a dry cell is most suitable for yielding some thousandths or some hundredths of an ampere, and not at all suitable for yielding $\frac{1}{2}$ ampere or more for any considerable period. (2) Evaporation of moisture gradually increases the resistance of the cell, and, far more serious, "local action" consumes the active materials even when the cell is on open circuit. (3) A stock of batteries cannot be kept for replacements: cells must be used soon after they are made if their performance is to be at all satisfactory. (4) Current provided by small dry cells is disproportionately costly. Only the immense convenience of small electric lamps and the lack of a better means of providing "pocket current" have been responsible for the enormous present-day utilisation of flash-lamp batteries. That there is room for a better method of providing current goes without saying, and one solution to the problem is described by W. Wedding in a recent issue of *E.T.Z.*

Briefly, this method consists in the use of a small magneto-generator driven by a spring in which energy is stored from time to time by the user. Suggestions have been made to use compressed air or gas generated as required to drive a small motor coupled to a dynamo, but such an equipment could hardly be sufficiently light, strong, and cheap. A similar and much more practicable idea is to use muscular energy derived from the person carrying the lamp, to generate current for its incandescence. Several attempts have been made, but Karl von Dreger (Budapest) seems to have been the first to devise a convenient equipment of suitable form and power. A useful output of one to two watts is derived from the thumb or

from the four fingers used together to move to and fro a lever or grip bar which is coupled through a suitable clock-work and spring to the armature of a magneto-generator. In order to keep the gear ratio and losses as low as possible, the dynamo armature is driven at comparatively low speed, and full use is made of the space available in order to obtain high peripheral speed. Obviously, the armature speed must be kept as nearly as possible uniform, but, with so low a total power available, it would be a mistake to adopt any form of braking to control the speed. Dreger's method is to balance the load imposed by the lamp on the dynamo, and the mechanical connection between dynamo, spring, and driving lever, so that when the latter is worked in the ordinary way, the armature speed is practically constant after the lamp reaches normal brilliancy. The spring works practically uniformly between $\frac{1}{3}$ and $\frac{2}{3}$ tension, and the available one or two watts keeps it under this tension during normal working.

By using several springs, which come into action successively, enough energy can be stored to keep the lamp burning for a short time without working the driving lever during that period. Such provision for storage of energy increases the weight and cost of the equipment. Even the simpler form of lamp is rather heavy as compared with battery lamps: for instance, a thumb-driven magneto lamp

FIG. 1.—DETAILS OF CONSTRUCTION OF HAND-DRIVEN MAGNETO LAMP.

without storage weighs about 1 lb., and if additional mechanism be added to yield 3 minutes' storage, the weight increases to 1 lb. 14 oz., which is sufficiently heavy, for a pocket-lamp. The more powerful hand-lamp, operated by opening and closing a finger grip, weighs 2 lb. 2 oz. without storage, and 5½ lb. if provision be made for 10 minutes' storage. (Presumably the spring grip has to be worked for 10 minutes to provide for 10 minutes' "independent" burning?).

Though a lamp with these general characteristics will undoubtedly be useful in special applications, there is certainly no reason to anticipate that battery lamps will fall into disuse. The higher first cost (not stated) of the magneto lamp is admittedly compensated to some extent (possibly completely) by the elimination of battery renewals, but the weight of the magneto lamp and the necessity for driving it continuously, or nearly so, are serious drawbacks. A light set which could be wound up at intervals like a clock would be more convenient in practice.

a somewhat different type of magneto lamp, due to O. Fischer, utilises a rotating ring magnet running between poles of a double-T armature. Driving is by periodic depression of a small lever, and the stationary armature is connected permanently to the lamp. The rotating magnet is also as fly-wheel, and runs on ball bearings. No springs are used, the driving lever acting simply through a 1:20 gear train. The magnet runs at 1,200 R.P.M., and the weight of the set complete is $\frac{1}{2}$ lb. A heavier set ($1\frac{3}{4}$ lb.) is available for use on bicycles, the drive being then taken on a roller pressing on the front tire. Other applications suggested for this equipment are in ignition apparatus, bells, and door alarms.

Our contemporary, *The Model Engineer and Electrician*, in its issue of March 29th, 1917, published a very detailed description of one of these German lamps, which was picked up on a battlefield in France. The following particulars are obtained from this source.

Fig. 1 shows the details of construction. It will be seen that the permanent magnet forms the case of the machine: it is $1\frac{1}{16}$ in. wide, No. 10 gauge, and weighs 5 oz. Between the poles is a bipolar armature, $1\frac{1}{8}$ in. in diameter, $\frac{3}{16}$ in. across the core, and $\frac{1}{8}$ in. across the end; it is wound with 28 enamelled copper wire, has two concentric slip springs, and weighs $1\frac{1}{2}$ oz. The core is machined out of the solid, and runs on a spindle $\frac{5}{16}$ in. in diameter, with pivots about No. 18 gauge. Two plates of aluminium, No. 18 and No. 22 gauge, form the sides of the case, and carry thin steel bearing plates; they are connected by four $\frac{3}{16}$ in. steel bars. The sector plate connected to the hand lever has 12 teeth, gearing with the first pinion, which carries a wheel on a plate to drive the ratchet wheel.

The hand lever is $\frac{1}{2}$ in. wide, and is stamped out of No. 15 steel plate; it is held closed by a catch, and when released opens to the working position under the action of a spring. All the parts, except the lampholder and the aluminium cap, can be assembled before the permanent magnet is placed in position, the magnet being held in place by screws passing through the cap, and screws which connect the lampholder to the base of the generator. The pinion driven by the lever has 12 teeth, and the ratchet wheel 32 teeth; between the latter and the main driving wheel (60 teeth) is a strong spring of No. 13 steel wire. The train of gearing consists of pinions having 8, 6, and 16 teeth and wheels of 60, 60, and 64 teeth, so that the armature revolves about 300 times for one revolution of the main driving wheel. The full travel of the lever rotates the first wheel $\frac{1}{2}$ revolution, and therefore drives the armature through 75 revolutions: at 40 impulses per minute this gives an average armature speed of 3,000 R.P.M. In the drawing a small felt pad is shown, which is held in a spring in contact with the top spindle. The lamp is suitable for 3.5 volts, 0.2 ampere. The generator, complete with the lampholder, weighs $16\frac{1}{2}$ oz.: it is $4\frac{3}{8}$ in. high, $1\frac{1}{2}$ in. across the side plates, and $1\frac{1}{8}$ in. wide. The author of the article, Mr. F. Westmoreland, who owns the lamp, states that it gives a very good light. Many more details, with photographs, are given in the original account. Obviously, there is practically no storage of energy in the lamp apart from the spring—which is merely a maintaining spring—and the fly-wheel effect of the rotating parts.

As a result, five substances were found to be equal on the average, and in some respects even superior, to ebonite. The actual results are confidential.

The test methods for instrument transformers which had previously been drawn up at the request of the Verband deutscher Elektrotechniker were supplemented so that at any ratio both the correction and the angular error can be read off directly on the arrangement adopted. The sources of error were fully investigated, and it was found that with the arrangement used they could be entirely eliminated. Comparative measurements on potential transformers by the new method and the electrometer method gave values in good agreement.

A method of measuring the phase angles of current-measuring resistances in a double bridge for alternating currents of technical frequency was devised. Phase calibration is effected by displacing suitable condensers mounted with cranked handles. Even with resistances of 0.0005 ohm there is close agreement between the measurement of the time constants to 10^{-7} sec., or of the phase angles to $\frac{1}{10}$ minute at 50 cycles per second.

A new type of vibration galvanometer was constructed which can be calibrated at a distance by electromagnetic excitation. The instrument is a needle galvanometer with crossed magnetic fields similar to the Rubens instrument. The needle is magnetised by an electromagnet and this excitation causes a change in directive force, and, consequently, in the calibration of the needle. The instrument has two internal attachments having needles of different dimensions: the first attachment can be calibrated for frequency ranges from 8 to 70 cycles per second, and the second for ranges of from 30 to 140 cycles per second. The image projected by the mirror remains in the field of view during change of calibration, and can be seen immediately the new internal part of the instrument is inserted. The sensitivity is given as 10^{-7} amp. for 1 mm. deflection at a scale distance of 1 metre.

A series of experiments was carried out on chrome-steel magnets with the result that such magnets, when of right composition and properly treated, can be used as brake-magnets in meters, being practically as good as those of tungsten-steel in respect of invariability and non-dependence on temperature.

THE WORKING COSTS OF THE PRINCIPAL PRIME MOVERS.

By OSWALD WANS, OF LINCOLN, M.I.Mech.E.

(Abstract of paper read before the INSTITUTION OF MECHANICAL ENGINEERS.)

THE object of this paper is to give data that will be of service in estimating capital expenditures and working costs, and in establishing the relative commercial values of the principal prime movers. For this purpose typical examples of the following prime movers will be considered:—

Suction-gas engines and plants burning anthracite, coke, and wood refuse.

Gas engines using town gas.

Oil engines of the solid injection high-compression type.

Diesel engines.

Steam engines.

The scope of the paper includes units up to a working load of 500 B.H.P., a power range embracing the engines for which there is by far the greatest demand.

The items constituting the total working cost are:—

Capital Charges:—	Running Charges:—
Depreciation.	Cost of fuel.
Insurance.	Cost of lubricating oil.
Interest upon capital expenditure.	Cost of water supply.
	Cost of sundry stores.
	Cost of labour.
	Cost of repairs.

Rent and taxes must be considered in addition, but owing to the wide variation in their amounts, it is not possible to make allowance here.

Capital Expenditure.—This should cover the total cost of the completed installation in working order. Buildings and floorings have not been included, as their cost varies widely, being largely dependent upon the taste of the purchaser.

The cost of the buildings for internal-combustion engines would be less than for a steam plant, and this applies equally to suction-gas engines, for the producer and cleaning plant do not require a covering, whereas some form of protection is necessary for a boiler. Cooling towers have been included in all cases, with the exception of the smaller gas and oil engines of about 50 B.H.P., as the more usual practice is to employ cooling tanks suitable for thermo-siphon circulation.

When deciding the size of the engine, it is necessary to consider its overload capacity, for this factor greatly affects the capital expenditure, the reliability, and the fuel economy.

The larger overload carried by a steam engine is a characteristic of considerable value in the handling of fluctuating and peak loads. Moreover, this advantage is attained without impairing the fuel economy at the working load. Unfortunately, this feature is not possessed by an internal-combustion engine.

ELECTRICAL WORK AT THE PHYSIKALISCH-TECHNISCHE REICHSANSTALT, CHARLOTTENBURG, IN 1916.

The *Elektrotechnische Zeitschrift* for September 13th gives some details of the work carried out at the Reichsanstalt during 1916, and the following notes refer to the portions of more general interest.

Exhaustive experiments were carried out on substitutes for ebonite to determine the suitability of such materials as insulators in electrical instruments, &c. The following points were considered in the research:—

1. Surface resistance under various test conditions.
2. Absorption of water.
3. Action of dilute sulphuric acid.
4. Action of heat (hot water, Bunsen flame, electric arc, &c.).
5. Whether easily worked (machined).

Cost of Labour.—The charges under this heading should include not only the attendant's time during running hours, it also that needed to clean, grind in valves, &c., and generally to keep the installation in good condition.

TOTAL WATER LOST. GALLONS PER WORKING LOAD B.H.P.

Steam engine	21.23
S.I. oil engine	0.325
Diesel engine	0.275
Gas engine: Town gas	0.375
Anthracite and coke	2.2
Wood, &c.	5.87

Wages at the rate of 6d. per hour have been allowed for in the cost curves, fig. 4.

The following formulæ give a fair indication of the time that is spent solely upon the prime movers within the scope of this paper:—

Suction-gas (wood fuel) and steam engine plants	$0.8 + 0.0047 \text{ B.H.P.}$
Suction-gas (coal and coke fuel)	$0.6 + 0.0041 \text{ B.H.P.}$
S.I. and Diesel engines	$0.3 + 0.0036 \text{ B.H.P.}$
Town-gas engines	$0.2 + 0.0017 \text{ B.H.P.}$

These expressions give the labour in hours per rated working load per hour. Thus for a 100-B.H.P. suction-gas plant using wood fuel, and a 100-B.H.P. town-gas engine, the labour would be respectively 1.27 and 0.37 hours per hour's run.

Cost of Repairs.—The annual charge should provide amply for wear and tear, and such breakages as are not covered by insurance.

The following are the repair charges allowed for in the working cost curves, fig. 4:—

Diesel and S.I. oil engines.	
town-gas engines	3 per cent. of engine cost.
Suction-gas installations	3 per cent. of engine and producer costs.
Steam installations	2½ per cent. of engine, boiler, and auxiliary costs.

From the foregoing data it is possible to estimate with reasonable accuracy the annual working costs of the engines under consideration. Water and fuel are the ruling factors:

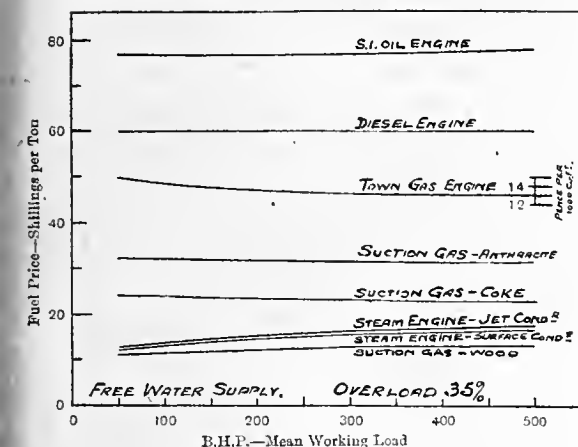

FIG. 5.—FUEL PRICE CURVES.

Curves are given with water at 9d. per 1,000 gals., and with water free, the latter of which is reproduced in fig. 4. None of the curves A to F include the cost of fuel, but curve G represents the total annual working cost of a Diesel engine using fuel-oil at £3 per ton. It follows, therefore, that the total amount that may be spent annually upon fuel to give equal running charges for any one of the remaining installations is represented by the length of the ordinate between the curve G and the cost curve of the particular engine considered. From the total fuel cost thus obtained, the maximum prices that may be paid can be easily computed, and have been plotted in curves fig. 5, whilst the fuel prices given by those curves for plants of 250 B.H.P. mean working load are given below:—

	Price of fuel. Curve, fig. 5.	Price ratio.
Diesel engine	60s. 0d. per ton.	0.785
Solid injection oil engine	76s. 6d. per ton.	1.0
Suction-gas: Anthracite	21s. 6d. per ton.	0.41
Coke	23s. 0d. per ton.	0.3
Wood	12s. 0d. per ton.	0.157
Steam engine:		
Jet condenser	16s. 0d. per ton.	0.21
Surface condenser	15s. 0d. per ton.	0.195
Town-gas engine	1s. 1d. per 1,000 cu. ft.	0.014

In the curves, the engine possessing the highest thermal efficiency, namely, the Diesel engine, has been taken as a convenient basis using fuel oil at £3 per ton. Reference to these curves shows that the relative fuel prices for the several installations are fairly uniform for the range of powers under consideration.

As the power increases a higher price may be paid for coal, and the steam engine becomes a more serious rival of the suction-gas plant; nevertheless, for installations up to 500-B.H.P. working load the latter well holds its own, for it is possible to obtain even running costs with fuel ranging in price, according to the power, from two to three times that permissible for a steam plant. The price allowable for town gas is practically constant at 1s. 1d. per 1,000 cu. ft., and consequently confines the use of the town-gas engine to cities in which gas is procurable at this low rate.

Calorific Values Assumed.

Anthracite	14,500 B.T.H.U. per lb.
Coal (boiler)	13,500 B.T.H.U. per lb.
Fuel oil	18,000 B.T.H.U. per lb.
Wood refuse	5,800 B.T.H.U. per lb.
Town gas	540 B.T.H.U. per cu. ft.

Turning now to the high-compression solid-injection oil engine, a high price may be paid for fuel oil, namely, £3 16s. per ton, as compared with £3 for the Diesel engine, notwithstanding the higher thermal efficiency of the latter engine. The lower capital expenditure and other running charges of the solid-injection engine are responsible for this result.

Before the war fuel oil could be obtained at an average price of £3 a ton. An adequate supply is of the utmost importance to manufacturers. With fuel oil at £3 a ton, the price of coal must not exceed on the average 25s. and 12s. per ton respectively for suction-gas and the larger steam plants over 250 B.H.P. in order that the total annual running charges shall not exceed those of an oil-engine of the solid-injection type. Considering the refuse suction-gas plant, the price of fuel, ranging from 11s. to 13s. a ton, even with a free water supply, limits its use to industries in which the refuse is a waste product of the industry.

It has been shown that the cost of fuel has a deciding influence upon the working cost, although that due to the necessary water supply may be serious in some districts. The maximum permissible prices that may be paid in any locality are indicated by the curves, fig. 5. The practical application of these price ratios shows that each type of engine has its particular field of action in which it can be used with commercial advantage, provided due regard is paid to the local conditions, or, in other words, an exclusive claim to minimum working costs cannot be rightly made on behalf of any one of the prime movers under consideration.

However thermally efficient an engine may be, the ultimate test is a commercial one involving the market price of fuel, which must always depend upon the facilities for distribution from the source of supply. In practice, therefore, railway and shipping freights have a marked and direct influence upon the type of engine giving the most favourable performance from the commercial standpoint.

FEDERATION OF BRITISH INDUSTRIES.

MR. F. DUDLEY DOCKER, C.B., the retiring president of this Federation, delivered an address at the annual meeting, held at the Connaught Rooms, on Friday last. Having referred to the growth of the Federation and to their prospect of being able to prove themselves a power for good in the welfare of the Empire, he said that the grave danger which faced all associations was stagnation. They must progress if they were to be useful. The first regular step towards stagnation was to have a perpetual president, therefore he declined, though with much personal regret, to be nominated for a second term. No better man could be found for the office than Sir Richard Vassar Smith, whom the Executive Committee suggested. Mr. Docker alluded to the complaint that subjects in which they were specially interested had not been taken up by the Federation, or the pronouncements had not been made on questions exciting popular interest. In many instances, while the Executive Committee did not appear to have taken any action, they had, in fact, been making careful inquiries and doing quiet useful sate work, and had only decided, after careful consideration, to avoid or sometimes to postpone taking action. It had not been lack of interest or want of energy, but a sense of responsibility that had induced the Executive to refrain from public reference to these matters. The position which the Federation had gradually built up was that of being the representative organisation of British manufacturers, and it was obviously wise to refrain from embarking lightly on any project, and to avoid subjects of secondary importance.

A question that must be considered by the Federation was the policy of protecting our trade against foreign aggression. This was a subject of absorbing interest to them as manufacturers, and it was not one that could be disposed of in a rough and ready way. There was no summary solution. They must consider and determine if any duty should be imposed, and on what goods, and whether or not preference was to be extended to our Oversea Dominions, or to any and which of our Allies. Again they must consult with the Government as to the method by which any tariff, when constructed, could

be used as a power to bargain with foreign nations. Personally, he was absolutely certain that they must have a power to bargain, but he strongly objected to this procedure being called Protection or Tariff Reform. This matter must have their earnest consideration, and he attached supreme importance to it, but there was a grave difficulty in the way. This Federation was an industrial association, and he would be sorry to see it in alliance with any political party. It would be detrimental to their interests to be labelled Liberal or Tory, or with any other political designation, and unfortunately the questions of Free Trade and Protection had become party measures, and one or other was included in the respective programmes of the two great political parties. Should it become necessary in the judgment of the Federation to advocate the imposition of a duty on any article in the interests of the manufacturers of this country, he would not object to such action, for it would be done definitely in the interests of British trade, and not at the request or instigation of any politician. If such a duty were imposed, in his judgment it should be used deliberately as a means of bargaining with foreign Governments to obtain facilities and preference for British trade. He was quite ready to support action by the manufacturers, but he deprecated that this Federation should be called a Free Trader or a Tariff Reformer. These terms belonged to politics, from which this Federation should keep itself absolutely free. Another important question of pressing concern was the relation which education must bear to industry. A sub-committee had been considering the proposals formulated by the President of the Board of Education, and they had invited the members of this Association to express opinions on certain subjects for the guidance of the Committee. This question of education lay at the root of a great many of their difficulties. If they were to be successful in competition, they must provide for the better education of themselves and their workpeople. One of the causes, in his opinion, of industrial unrest was the lack of knowledge; it was a fruitful agent for the generation of suspicion, and he therefore urged that the Federation should concern itself particularly in fostering in no niggardly spirit the spread of education. Allied with education was the sense of discipline. There was no doubt that the lack of discipline created an irresponsible condition which was detrimental to all well-being. One and all, they should do their utmost to help on such movements as the formation of cadet corps, which while improving the physique of their young people, at the same time inculcated a respect for authority, and a desire to play for the side, rather than encourage selfish tendencies. During the past year the Association had done well; their foundations were solidly laid, and they had obtained recognition from the Government. *The Prime Minister had authorised him to say that he would welcome any federation of industry, and expressed an opinion that such an association would be of assistance to any Government.* They must go on, and it should be their object to obtain some recognition and status in the eye of the law that would place them in as favourable a position as the Trade Unions now occupied. Mr. Docker said he desired to publicly tender to Sir William Peat, Mr. Oldham, and Mr. Nugent and Major Caillard in particular, and in general to the chairman of the various sub-committees, and the office staff, his very hearty thanks for the efforts they had made to carry on the work and to create a sound and efficient organisation.

Sir WILLIAM B. PEAT, in proposing a vote of thanks to Mr. Dudley Docker, said that Mr. Dudley Docker was the pioneer not of trade combinations, which had existed for 20 years, but of a combination which should embrace all trades—a far larger and far grander idea—a combination which embraced, or ought to embrace, not alone the capitalist interests of the country, but the labour without which that capital could not succeed.

In responding, Mr. DOCKER said that the Federation was the idea of his life. He had always thought, and always hoped, that manufacturers would all come together to help this great country. "We were the greatest manufacturers in the world if we only knew it." Their influence was greater than they had the least idea of. Individually it was nothing, collectively it was everything. He hoped the membership of the Federation would largely increase. He was also hoping that they would have a home of their own where they would meet together and discuss the great subjects of the day, and that their weight would be so great that the Government would consider them and talk to them.

Sir VINCENT CAILLARD (Messrs. Vickers, Ltd.) proposed the election of Sir Richard Vassar Smith as President of the Federation for the ensuing year. He joined in the expressions of regret that Mr. Docker should vacate the presidential chair. This great Federation had immense problems to face and solve. To accomplish successfully its objects, which were not confined to that country, or even to the Empire, but were world-wide, would require on the part of all the members of the Federation breadth of view, untiring energy, unflinching courage, conciliation, and determination. Sir Richard Vassar Smith was known personally to a great many of them, and by reputation was known to them all. In him they had all the necessary qualities enumerated in a very high degree.

The resolution was carried unanimously.

The following gentlemen were elected vice-president of the Federation for the ensuing year: Mr. Dudley Docker, Lord Aberconway, Sir Vincent Caillard, Mr. A. H. Dixon, Sir

Algernon Firth, Sir Robert Hadfield, and Mr. W. Pe Rylands.

On the motion of Mr. Docker, seconded by Mr. H. B. Ryland (County of London Electric Supply Co., Ltd.), the following annual report was unanimously received and adopted.

Mr. W. PETER RYLANDS (The Iron and Steel Wire Manufacturers' Association of Great Britain and The Wire Net Association) said that the appointment of an Executive Council was probably the most important business with which their Federation had to deal. A committee was appointed to consider the whole matter, and had made recommendations. The lines upon which those recommendations had been framed had been those of endeavouring to construct an executive which should be representative of industry by group so that each group of industries whose interests were more or less analogous should themselves directly elect their representatives to the executive. When they came to consider the question of groups they found considerable difficulty. There were the big main groups of industries, and there were smaller groups. They also got overlapping in many of the groups, such as that between engineering and the iron and steel manufacturers. Accordingly, the view they took was that the plan would be to take the big groups of industry as the basis, letting each group decide for itself the sub-division particularly appropriate to the group. They were proceeding upon those lines. The scheme was very nearly complete, and letters were about to be sent out to the secretaries of associations asking for certain material information necessary to construct a constitution upon the lines indicated.

WAR ITEMS.

Ministry of Munitions.—The Minister of Munitions made the following appointments within the Ministry:—

Major J. W. Hills, M.P., to act temporarily as a member of the Munitions Council in charge of the Labour group during the absence of Sir Stephen Kent, K.C.B.

Vice-Admiral Sir A. G. H. W. Moore, K.C.B., C.V.O., to be Controller of the Mechanical Warfare Department.

Major-General H. F. Thudler, C.B., C.M.G., to be Controller of the Chemical Warfare Department.

Brigadier-General A. C. Currie, C.M.G., to be Controller of Munition Design.

Mr. E. V. Haigh, to be Controller of the Trench Warfare Supply Department.

Mr. H. C. B. Underdown, to be Director of the Agricultural Machine Department.

Major H. Newton, D.S.O., to be Assistant Director of the Trench Warfare Department.

Mrs. H. J. Tennant, C.H., to be Chief Adviser (Women's Welfare) in Labour Regulation Department.

Women's Work in Engineering.—The Ministry of Munitions' Exhibition of official photographs and other war industries to be opened at the City Art Gallery, Birmingham, on Monday afternoon next. It will remain open until November 10th from 11 a.m. to 8 p.m. daily.

German Coal Shortage.—The special correspondent of the *Times* at Amsterdam states that speaking in the Frank Municipal Council concerning the coal situation, one member said that the civilian population of the city received only instead of 40 per cent. of the coal promised. The municipal industries were receiving much more than their share, and a coal famine would be worse than anything experienced hitherto during the war.

Fuel Shortage in Athens.—In Athens fuel scarcity is acute, although the electric current for public use has already been reduced to a minimum and traffic on several tram lines suspended. The electric works recently had fuel for one day only, and it is proposed to requisition uncut timber.—*Times*.

The Aron Meter Co.—The German newspapers state that the liquidation has been concluded of the interests in the Aron Electricity Meter, Ltd., of London, particularly the latter's participation in the firm of H. Aron, Elektrizitäts Zähler Fabrik, G.m.b.H., of Charlottenburg.

Engineers' Bonus.—The Ministry of Munitions has issued the Skilled Timeworkers (Engineers and Moulders) War Order, 1917, dated October 13th, 1917 (with a view to ensuring the maintenance of the output of munitions), relating to the remuneration to be paid to fully qualified skilled engineers and moulders of the class specified in the Order, work being munitions work or work in connection therewith, which at the time when these directions are given is paid time rates.

Workmen to whom these directions apply shall receive a bonus of 2½ per cent. on their earnings, which shall either alter or become part of their time rates, the bonus to accrue from the beginning of the first full pay following October 12th, 1917, and the first payment thereof is to be made as soon as possible, and not later than the first full pay day, November, 1917. The directions apply, subject to the following provisions, only to fully qualified skilled engineers and moulders rated at or above the current district time rates, turners or fitters while employed on or in connection with munitions work and paid at plain time rates without addition of any bonus other than (a) a bonus dependent

timekeeping, (b) a bonus (not being a bonus on output) less favourable to such workmen than the bonus payable under these directions, in which case the existing bonus shall merge in the bonus payable under these directions, (c) a war advance given to meet the cost of living as the result of or in conformity with arbitration under Part I of the Munitions of War Act, 1915.

These directions shall not apply to workmen of the class specified above whose wages it has been the practice to regulate by the movements in the wages of men employed in trades other than the engineering and foundry trades. An application may be made to the Minister of Munitions for special directions in cases where the existing basis of remuneration for such workmen is less favourable than that of workmen of the same class to whom these directions apply.

These directions will not apply to workmen paid an up-standing wage or salary which covers overtime or other allowances. Nothing in the foregoing provisions shall affect the present basis of determining piece rates or premium bonus times or any other system of payment by results.

Exemption Applications.—Lewes Tribunal has withdrawn conditional exemption held by A. J. Cox (31, garrison duty abroad), jointer and shift engineer at the Lewes electric light works, and substituted three months' temporary exemption.

According to a Swansea newspaper, a special meeting of the Neath Rural District Council has been held to consider the question of military appeals against certain employees of the Council's electric lighting station. Mr. Thomson, electrical engineer, said that if the military appeals were successful the Council would be compelled to close down one or two shifts, and it would be impossible to carry on the power station without suitable men. It was decided to notify the Council's consumers of the position, and to emphasise the fact that no action would be taken without giving them reasonable notice.

On the recommendation of the Advisory Committee, Rochdale Tribunal has granted conditional exemption to E. Hornby (29, B 2), motorman, appealed for by the Corporation tramway department.

Surrey Appeal Court has granted a final month's exemption to G. T. Church (31, B 1), electrical engineer, of Chertsey.

Lancashire Appeal Court has granted three months' exemption to five electrical men engaged at the works of Messrs. Pilkington Bros., Ltd., St. Helens.

At Walthamstow, the tramway manager (Mr. W. Murray) appealed for 12 tramdrivers, and said that they were in great straits for want of men, and those appealed for could not be replaced. Nine of the men were granted six months, and the others three months each.

At Dawlish, the Electric Light Co. renewed an appeal for C. C. Hodges (31), manager and secretary, who was stated to be doing all the work of the concern, with the aid of two pupils. The Military suggested temporary exemption until a substitute was obtained, but conditional exemption was granted so long as Mr. Hodges remains in his present employment.

Renewed temporary exemption until January 1st has been granted to G. Dring (28), electrical engineer, appealed for by the Ilfracombe Electric Light Co.

Berks. Appeal Court has dismissed a military appeal against exemption granted to J. H. Ferguson (36, C 3), managing director and secretary of the Whitechurch and Pangbourne Electric Supply Co., Ltd.

High Wycombe Tribunal has granted six months' exemption to R. Pugh (40, B 2), electrical engineer.

At Congleton, an appeal was made for the man in charge of the electric light plant at Moreton Hall, placed in Class C 3 after three rejections. He was given conditional exemption until March 31st.

Before the Brailes Rural Tribunal, a review was made of the case of G. F. Hall (33, Class A), electric light attendant to Mr. J. R. King, at Honington Hall. It was stated that an efficient substitute had been offered and refused, and Mr. King said that in addition to working for him, Hall was the only practical man he had to carry on the electric light plant at Shipston. If he went there would probably be no light at Shipston, and the capital of the company owning the undertaking would be in danger of being lost. The substitute offered knew nothing about meters or wiring, and when he found that he would have to do this work he refused to stay. Another substitute sent was only a gardener and painter. The appeal was dismissed, and exemption continued.

The same Tribunal dismissed a military appeal against exemption held by A. W. Whitehead (40, C 2), electrician to Sir Grey Skipwith.

Six months' exemption has been granted to A. F. Pinson (19, C 2), Swanscombe, driver on the local tramways.

At Greenwich, an appeal was made by J. H. Hardwicke (26, C 2), electrician at a Woolwich music hall, and a month only allowed.

At Broadstairs, the Isle of Thanet Tramway & Lighting Co. appealed for five tramway employees as being indispensable until efficient substitutes are found. The manager (Mr. Forde) said that owing to the drain upon their staff it was necessary to reorganise the service. Each man was allowed a month, with the privilege of a personal appeal later.

Before the East Sussex Appeal Court, a Brighton electrician appealed for extended exemption, and the employer said that

since the last appeal two improvers had joined up, and he had been unable to replace them. The work was of national importance, and consisted entirely of maintenance work at military hospitals, &c. He himself was a Regimental Quartermaster-Sergeant in the Territorials, was just completing 30 years' military service, and was quite willing to enter into an agreement whereby the Army kept him and released the man. The decision of the Court was a final three months.

On the appeal of the Corporation tramway department, Rochdale Tribunal has exempted until February 28th, F. Walton (29, C 2), overhead linesman, who has been discharged from the Army.

G. Cooper (35, B 1), electrician, applied at Mansfield for his certificate of exemption to be varied. He was granted four months last June, and given the option of going into munition works. He did so, but his health was affected, he being subject to gas poisoning, and he asked to be allowed to return to electrical work on his own account. The request was acceded to, and exemption until January 31st was granted.

At Mansfield, temporary exemption until a substitute is found was applied for by Mr. E. H. Hewlett, borough electrical engineer, for H. Topley (18, Class A), switchboard attendant, whose protection certificate has been withdrawn. Mr. Hewlett stated that the supply of power was very important indeed, and the man's work was skilled. He should like exemption until Christmas in order to get a 16-year-old learner a little more experienced. The appeal was refused.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The E.T.U. and the A.E.S.E.

"Shift Engineer," in his remarks published in the ELECTRICAL REVIEW, makes use of the motto, "United we stand, divided we fall"; but in the case mentioned—i.e., the amalgamation of the A.E.S.E. with the E.T.U.—this motto would be wrongly applied, for the simple reason that there would be a division among the members of the A.E.S.E., the greater number of whom would immediately resign. Apply this motto to the A.E.S.E. only; let all qualified station engineers become united in the A.E.S.E., and make it a strong and creditable Association that engineers will be proud of and that chiefs will look to for assistance.

The suggestion of amalgamation is absurd; no man who is an electrical station engineer in the full sense of the word can at the present time, nor until a very great change has taken place in the social state, meet with the workmen who work under him to discuss their respective salaries and wages, or the general conditions under which they work. The engineer has, in the majority of cases, to act as deputy for either the chief, or president, or mains engineer during his hours of business, and cannot become, or make, a confidant of the workmen.

"C. W. B." is quite correct when he says that "station engineers have a live organisation," but it is the A.E.S.E., not the E.T.U.

The A.E.S.E. is the only organisation that at present represents station engineers. For patriotic motives, also due to a very large percentage of its members being on war service, this Association considered it advisable to discontinue its meetings for the period of hostilities, unless some very urgent business came forward. Unlike certain other societies, the A.E.S.E. does not wish to hamper or delay the progress of the war by causing discontent in generating stations. That has never been the policy of the A.E.S.E. Where there has been discontent it has generally been remedied by the case being clearly stated to those in authority.

I quite agree with "Engineer-in-Charge" in his leading remarks, and he fully explains the unique position of the shift engineer by saying it is "absolutely anomalous."

The apparent results of the A.E.S.E. have been few, but it has done some very good work, in spite of the war and the efforts of the E.T.U. to cripple it. I think it probable that a number of the members of the A.E.S.E. who have been drawn into the fold of the E.T.U. are the agitators who, at the commencement of the A.E.S.E., caused it so much trouble by attempting to force a policy of agitation and disaffection; if so, we must be grateful to the E.T.U. for relieving the A.E.S.E. of a very unpleasant burden.

W. E. R., *Serjeant, R.E.T.*

The Association Movement.

I have only this afternoon had my attention called to the letter in the ELECTRICAL REVIEW, written by Mr. Llewelyn B. Atkinson, Secretary of the Cable-Makers' Association, with reference to the above matter. If Mr. Atkinson has only been closely associated with the Cable-Makers' Association for something over 14 years, he will, perhaps, be more easily pardoned for giving expression to several inaccuracies with regard to facts which occurred some years earlier. It is, however, regrettable that he did not obtain further corroboration for his statements in those quarters where, no doubt, official records could be traced to verify my earlier statements.

I have no "axe to grind" in cable circles, and I have no particular wish or need to stand in the limelight in this matter,

especially if the times have already been casting their brilliancy elsewhere. Were it otherwise Mr. Atkinson might have heard of me before.

I must now, however, as I am directly challenged, give further specific details of the actual indisputable facts, as they occurred in their exact sequence.

I stated that after a preliminary conversation with Mr. J. J. Easton, my first interview was with Mr. Alexander Siemens. I will now add that my second interview was actually with Mr. Taylor at his factory at Helsby, upon the only occasion on which I have ever visited those works in my life.

It is many years since I met Mr. J. S. Paterson, and I believe he has left the cable industry, but I trust this letter will come before him. Mr. Paterson gave me his active support, and will be able to give an unbiased record of those events.

In my communication, I reported that I only had difficulty in one quarter. I did not expect to find it necessary to refer to that again; but as the necessity arises, I beg to state that it was the late Mr. Robert Gray who, in his own office, informed me that he did not believe it possible for such an Association to exist for any length of time, and he believed in the "survival of the fittest."

My last interview of all (how surprised Mr. Atkinson will be!) was with Mr. Henry Edmunds, then chairman of Messrs. W. T. Glover & Co., Ltd. I did not disclose to him my conversation with Mr. Alexander Siemens, but I did state that I had met with almost complete success. Mr. Edmunds's reply to me was that he would see Mr. Robert Gray himself, and that he believed his influence would be effective. Up to that time, I beg to state most definitely and emphatically that Mr. Henry Edmunds had not seen or spoken to any one of the parties interested in this subject, from the time I started the campaign until then, nor had he any knowledge of my earlier movements until I communicated them to him. Almost immediately afterwards, the first preliminary meeting took place, and the subsequent events are no doubt correctly related by Mr. Atkinson.

Mr. Atkinson will, however, perhaps be interested to learn that Mr. Henry Edmunds had some time before, if I am correctly advised (to requote Mr. Atkinson's method of expression), "had the idea to found, or be associated with, a trade organisation." This, however, had a short life, if a merry one, and broke down. I referred to this event in my original communication.

I would mention that the whole of these facts can be corroborated by Mr. J. J. Easton, if his memory serves; if that fails, by the official records of Messrs. Siemens, to whom all progress was reported.

In conclusion, I would like to add that, by placing the genesis of the Cable-Makers' Association on record, I am not wishing to detract from the later efforts of those who have brought this Association to so successful a conclusion, and I am particularly sorry that Mr. Atkinson did not extend his inquiries into wider channels before seeking publicity.

Herbert H. Berry.

London, W. 1, October 23rd, 1917.

"A EUROPEAN CONCERT."—A correspondent at the Front points out that a misprint occurred in the letter under this heading in our issue of September 28th; the supply voltage is not 2,000, but 220 volts. Reference to the original shows that the error on the part of the compositor was not inexcusable.—EDS. ELEC. REV.

The Niche and Its Occupant.

The war is the biggest moral earthquake which has taken place in the memory of man. It is responsible for the overthrow of institutions and customs, generations in the making, which had become as harbours of refuge against the grasping hand of self individual gain. We know that things can never bear the same relationship in the years ahead as they did in the far-away summer days of 1914.

One of the outcomes of the upheaval is the closer relationship between Capital and Labour. It took a European war to enable each to discover the true worth of the other, to find the true meaning of the motto, "Unity is strength," and to sow the seeds for true co-operation in the happy days to come "*après la guerre*." And if half the schemes which have seen the light of day obtain realisation, the world will indeed be a better place.

Unfortunately, the boundary line of labour is tending to become too sharply defined. It is increasingly evident when labour is mentioned that "productive" labour only is referred to. The producer—the man who weaves the article, who produces the tangible result with the toil of his hands and the sweat of his brow—he is the man who will benefit by the utopian schemes held out like sugar plums to a fractions child. But what of the man whose brain created the vision from which the tangible thing was evolved? He is still left where he has, perforce, been compelled to rest in a little niche in the wall—out of harm's way, yes, and quite as easily forgotten as a sculptured saint in a cathedral portal. He is a member of the "staff," and as such is outside the labour qualification. His wage has become a salary, his time-sheet a mere set of numerals on the roll of the clock recorder, his hands are idle from the result of daily contact with the crude components of his dream-child. He is a man above, a being apart, but alas! in such a minority that he ceases to be worth consideration when the betterment of the individual lot is on foot.

Co-operation for the producer is in the air. Cannot the flashes which are illuminating the darkness produced by the present chaos shed a little light on the niche in the wall and awaken the capitalist to a realisation of the untapped source of national energy lying dormant there?

The loyalty of the staff to its chief is beyond reproach. When will he discover their true value, and respond to the mute appeals for recognition, even if it be but the acknowledgment of trust well-placed and well-proved? Its loyalty can become something more than a mere expression of willingness to serve. It can become a real dynamic force urging the manufacturer and producer, and, through them, the nation at large, into new channels of enterprise, and opening vistas of a world-wide expansion at present unattained.

Abolish the niche, give its occupants freedom to expand, eradicate by careful attention all that belittles it, encourage all that expands and ennobles it, as you would your producer, and the day will not be far distant when you will be repaid not thirty, not sixty, but a hundredfold.

F. E. S.

LEGAL.

THE BOSCH MAGNETO PATENTS.

THE supremacy of the Bosch magneto was discussed in the Patents Courts on Thursday, last week, when the British Lighting and Ignition Co., Ltd., of 204, Tottenham Court Road, London, W.C., applied for licence to use 21 German-owned patents for these magnetos.

The application was heard by the Controller, Mr Temple Franks, and Sir Cornelius Dalton.

MR. HUNTER GRAY appeared for the applicants, who were, he said, a firm formed in May of this year to acquire the plant, machinery, and factory of the Bosch Magneto Co., Ltd., which was practically entirely owned by German capital. This Bosch Magneto Co. had 120 patents or applications. The purchasers direct were Messrs. Vickers, Ltd., who formed the present applicant company to work the plant bought from the Controller. They paid a large sum of money. The works, however, were not manufacturing works. There was merely a repairing shop. The magnetos before the war were not even assembled here. They came over actually completed and assembled, and all the firm did in England was to effect repairs to damaged magnetos. Undoubtedly the Bosch was at that time the best magneto that could be obtained for motor-cars, and a great deal of work had been spent on its evolution. Mr. Gray went on to say that he did not want the licence to be made out for the term of the war only. A company of this size, with a large capital and under the guidance of Vickers, was not going back from the position it must take up, seeing the great amount of money that must be spent to get this industry into this country. A very large sum was paid for the fixed plant, machinery, and factories. The applicant company was formed with a capital of £200,000. Very substantial sums had been spent by the applicants since the purchase was made, and there was no question of the future rate of manufacture. These magnetos were now being made in large numbers. A licence had already been given to the Chesham Supply Co., Ltd., to manufacture (ELECTRICAL REVIEW, May 25th); the sum fixed as payable by way of royalty was then arranged at 5s. per magneto. That, under the circumstances, was very generous, and if the Court could see its way to fix a smaller royalty in the case of the present applicants, no doubt that would react, and the Chesham Supply Co. would get the benefit of it.

SIR CORNELIUS DALTON: I understand that for a motor bicycle before the war the cost of the magneto would be £1 retail, and for a four-cylinder car it would be up to about £12. There must have been a considerable number made.

MR. GRAY: I am told by the manager that the biggest output, which occurred about the year before the war, was 100,000 in the United Kingdom and the Colonies, excepting Canada.

THE CONTROLLER: If you can give us any reason or consideration why the royalty should be lowered we will hear you.

MR. GRAY: When you consider the great expenses to be incurred, I think you will see there is a reason why a small royalty should be imposed. There are special considerations in this case which do not apply to all applications. He went on to say that the applicant firm were turning out for war work a very large number per week. They hoped to go on increasing that number during the war, and after, but they would not be able to do it unless they got a big market. They could only get that and beat the Germans if they had highly developed works and equipment which would enable them to compete with Germany after the war. The Chesham Supply Co. applied only for nine patents, and only two of those were in the present list. He apprehended they might find it necessary to come to the Court again. The whole of the 26, with the exception, perhaps, of three or four, were embodied in the magneto actually made by the applicants.

IF MR. GRAY said, the Germans were to be allowed to compete without legislative restriction, and to manufacture in this country, and English makers had to pay them a big royalty, they would try to get all the trade back after the war.

Applicants' general manager, MR. A. BENNETT, said he was in the service of the Bosch Magneto Co. from 1907 until it was wound up by order of the Board of Trade. The colonial business grew latterly, but he should say 80 per cent. of the output was for this country, or 80,000. The prices before the war would range from £6 to £50, the last figure for the big stationary gas engines; but for motor cars and bicycles the prices would be from £6 to £12. He calculated that they were doing 90 per cent. of the total magneto business of this country. The plant would have to be multiplied several times to render it equal to producing the quantity the Bosch Co. formerly imported. Mr. Bosch's own explanation of his success was that his works were situated in a part of Germany which was very far away from the natural sources

of supply, and he could only succeed and make money in that part by doing excellent work.

THE CONTROLLER: You say the success of the Bosch magneto was due to admirable workmanship?

WITNESS: Yes; and we can secure good workmanship here. We are making magnetos for most of the aircraft at the present time. It is only a matter of experience to get the material up to the excellency that the Germans attained.

MR. GRAY: Did Bosch's ever make machines in this country?

MR. BENNETT: No; we only made machines in London for the purpose of competition where it was laid down that the whole engine had to be of British manufacture. Mr. Bennett added that he would like the royalty to be as small as possible, because he was responsible. He would be quite pleased if it could be fixed at 5s.

An officer from the Admiralty, **COMMANDER BRISTOW**, giving evidence, said he had been particularly concerned at the Admiralty with magnetos and their use for public purposes.

He agreed that the sum of 5s. for royalty was excessive, and that the offer of the Chesham Supply Co. should not be allowed to weigh on anybody's mind to any degree. They were not magneto manufacturers, but cab proprietors and hirers. The Government have been in consultation with patent experts in this country, and their view was that upon the validity of these patents they could put up a very decent fight. They would challenge the validity of all these patents, except, perhaps, two—one dealing with the central terminal and the lagging pin, and the other a patent on the hole in the contact-breaker cam, which was fitted with a wick taking the oil to the surface of the cam. The number of magnetos imported to this country before the war, as far as they could make out, of all sorts, from America, Germany, and oddments, amounted to 280,000 a year. So that if the trade was struggling under a royalty of 5s. a magneto, it would be paying to Bosch in Germany £70,000 per annum. A licence went on for several years, so that a very big amount at that rate would be paid to the Germans for a number of patents of which it was said that they were not valid. Moreover, it was perfectly true, as Mr. Gray said, that the superior quality of the Bosch magneto did not lie in the patents, but in the workmanship and material, and it had been found quite possible for magnetos superior to the Bosch to be turned out, not embracing any device for which Bosch could claim a patent. Mr. Bennett was perfectly correct when he said their works would have to be very much extended before they could cope with the whole requirements of the country; but he did not think he need be afraid of the German on that particular account. The following companies were also manufacturing: The British Thomson-Houston Co., the British Westinghouse Co., Siemens, Ericsson, Peel-Comer, Thomson Bennett, the M-L Magneto Syndicate, the Watford Speedometer Co., the Fellowes Magneto, and others. The total capital of these companies must run into millions of pounds. For the first five alone the capital was very considerable. All these proposed to continue after the war. All these firms were members of the British Magneto Manufacturers' Association, and they were unanimously agreed that they would fight the Bosch Co. if necessary. He believed that they had established some sinking fund or reserve to enable them to engage in litigation with the Bosch Co. if the Bosch Co. wanted it. The upshot of all these consultations had been that, whatever others might do, they had definitely made up their minds that they would not apply for a licence, and they were anxious that nothing should be done by anybody else to prejudice the position which they had taken up with regard to the validity of the patents. Although the Government saw no objection to Messrs. Vickers having a licence, the Government would not regard with equanimity any clause inserted in that licence which made them appear to be sole licensees. It would not be satisfactory if the Court granted a licence which in any way would enable the Bosch Co. to say at the end of the war that anybody legally acknowledged the validity of the patents for which licence was granted.

THE CONTROLLER: The licence would only be between the applicants and the Board of Trade, and no licence for war use could ever be taken to be a general guarantee of the validity of the patent rights.

COMMANDER BRISTOW: Say, for instance, that the British Thomson-Houston Co. were using a certain patent, we should not like it to be possible for the Bosch Co. to say: "It does not matter what you think about its validity. A licence has already been granted in respect of it, and the Patents Court has recognised it." Take the patent for the central terminals and lagging pin. If Messrs. Vickers had taken out a licence for that, we should not like them to be in a position to turn round and say: "We have taken out a licence for this patent, and you cannot now challenge it."

MR. GRAY: They cannot do that.

SIR CORNELIUS DALTON asked Commander Bristow: Do you think it wiser for the present applicants to join the other companies?

COMMANDER BRISTOW: That is a matter I have no opinion to express upon.

THE CONTROLLER: What will be the demand for the output of magnetos after the war?

COMMANDER BRISTOW: With 280,000 a year required before the war, it is highly probable that that number will be greatly exceeded after the war. There is a great movement for reforming the motor trade, and by standardisation to place this country in a much better position to fight the importation of these foreign cars.

In reply to the CONTROLLER, **COMMANDER BRISTOW** said the demand for magnetos for aircraft was likely to increase, as well as for pumps, agricultural machines, and all sorts of things.

MR. GRAY: Now that I have Commander Bristow's support, I am going to ask you, Sir, to give us the licence at a lower royalty.

SIR CORNELIUS DALTON: You still want a licence after hearing him?

MR. GRAY: Yes; if we find that we don't, we can notify you to that effect afterwards. In considering this application, I should like you to bear in mind that this is a key industry.

THE CONTROLLER: We shall recommend that a licence be granted. It can be borne in mind that the Chesham Supply Co. were only applying, when they were before us, for licence to use for their own particular purpose, and it may be now that we shall be quite prepared to reconsider the whole question of royalty, and to recommend the Board that all people who come for a licence now—and possibly even the Chesham Supply Co.—should have the royalty based on these new considerations. We have in this Court to take into account a variety of considerations: first, how far the patents enter into the process of manufacture, then what is the public interest, and finally the development of the industry. The applicants will be duly notified by the Board of Trade as to their licence, and the conditions on which it is issued.

NEW ZEALAND COMPENSATION CASE.

A DISPATCH in an Auckland paper states that at Wellington £2,000 damages were awarded by a Christchurch jury to Mrs. Minnie Jones, whose husband was killed by electric shock while working on the North Canterbury Hospital roof; £1,000 for herself, and £250 for each of four children. The claim was for £2,500 against the North Canterbury Hospital Board.

BUSINESS NOTES.

City Business Men and Government Control of Trade.—

Yesterday afternoon there was to be held at Cannon Street Hotel a public meeting of merchants, manufacturers and traders concerned in the production, importation, and distribution of commodities of national necessity. The object was to consider the effect of the present system of Government control of trade upon legitimate commercial interests. The following resolutions approving of the recommendations of the London Chamber of Commerce Merchants' Committee, which we reproduce from the *Financier*, were to be submitted:—

(a) That Government should cease to act as trading intermediary between producers and consumers, but should utilise to the fullest extent the services of the business community.

(b) That to this end merchants should be encouraged to continue to carry or import stocks of commodities essential to this country.

(c) That, so far as any control of imports and exports is concerned, the quantities allowed should as far as possible be based upon a fair allocation of quantities amongst merchants dealing in particular articles, after consultation with representative trade organisations. Permits should only be granted to British and Allied subjects who are legitimate merchants and importers to the trade involved.

(d) That the various control departments should be co-ordinated so far as to secure a uniform system on questions of principle and to obviate present delays in dealings with licences and permits.

(e) That control departments should in all cases be assisted by representative business men nominated by their respective trades.

(f) That steps be taken to represent to the Government, to Members of Parliament and the public generally the views set out in the report of this committee.

Basic Pig-Iron from Midland Ore.—

The Right Hon. George Roberts, M.P., P.C., lit up on Saturday last the last remaining idle furnace at the Stanton Ironworks, which has been placed in commission for the purpose of making basic pig-iron out of local iron ore for steel making. The manufacture of basic pig-iron out of local ore is a new industry in the Midlands; and not until the shortage of raw materials for steel-making purposes had made itself felt were the Midlands called upon to divert their blast furnaces to the manufacture of basic iron. It is of interest to note that under normal conditions these furnaces remain in continuous operation for some 15 years before requiring relining. The Stanton Co. now have in commission nine furnaces, and supply their own iron ore and coal, &c.

Catalogues and Lists.—

MESSRS. TREDEGARS, LTD., 9, Diana Place, Euston Road, London, N.W.1.—Leaflet giving prices, &c., of the "One Part" holder.

BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—List No. 4,155, giving description, dimensions and shipping particulars of oil-break switches, type O. Form E, also No. 4,153, giving similar information respecting Form C.

THE SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, London, W.C.—Thirty-six-page illustrated pamphlet giving prices and essential catalogue details of "Sunlite P.E.", "Diffusa," Holophane, and other reflectors, and fittings for use with half-watt lamps, for lighting all departments of works and general offices, stores and tool-rooms, &c., also for yard, cinema and public building lighting.

MESSRS. COLE, MARCHANT & MORLEY, LTD., Bradford.—Twenty-four-page publication showing a large number of illustrations of condensing plants specialised in and installed by them.

MESSRS. SCHOLEY & CO., LTD., 56, Victoria Street, London, S.W.1.—Leaflet fully describing the Copps feed-water regulators, for which the firm has recently booked a large number of orders. These include contracts with Sheffield (repeat order), Manchester and Birmingham Electricity Departments, the Yorkshire Electric Power Co. (repeat), Messrs. Babcock & Wilcox, and many industrial firms.

ELECTRICAL APPARATUS CO., LTD., Vauxhall Works, South Lambeth Road, London, S.W.—No. 4 of the E.A.C. "Quarterly Review," just issued, contains a good deal of illustrated material

relating to E.A.C. work in war time, and to the company's manufactures, such as an A.C. no-volt release, air compressors, springing figure type cyclometer counters for E.A.C. meters, controller regulators, testing rheostats, and automatic protection for slipping motors.

Liquidation.—BRITISH CONTINENTAL ELECTRICITY CO., LTD. Creditors must send particulars of their debts, &c., to the Liquidator, Mr. C. E. Barker, 21, Finsbury Pavement, E.C., by November 30th.

Stoker Contracts.—THE UNDERFEED STOKER CO. has effected sales of its stokers to the following electricity authorities:—

Wolverhampton Electricity Works	10 A
Brighton Electricity Works	6 A
Swansea Corporation Electricity Works	2 E
St. Helens Electricity Works	1 E
St. Albans Electricity Works	1 E
Carlisle Electricity Works	1 A
Bath Electricity Works	1 E

The latest list of customers for these stokers also includes the War Office, Messrs. Armstrong, Whitworth & Co., and a number of collieries, ironworks, &c.

Book Notices.—Science Abstracts, A and B. Vol. XX. Part 9. September 29th, 1917. London: E. & F. N. Spon, Ltd. Price 1s. 6d. each.

"Letters concerning the War: Between an American and a relative in Germany." Privately printed, New York.

"Beuma Journal." Vol. III. No. 4. October, 1917. London: Oakley House, Bloomsbury, W.C. Price 1s. net.

"Post Office Electrical Engineers' Journal." Vol. X. Part 3. October, 1917. London: H. Alabaster, Gatehouse, and Kempe. Price 1s. net.

LIGHTING AND POWER NOTES.

Acton.—The Council has received a cheque for £2,500 from the Metropolitan Electric Supply Co., in accordance with the terms arrived at when the Council disposed of its powers to the company.

The profit on the Acton undertaking was stated to be 10·26 per cent.; and having regard to this, the Council expressed the opinion that the company was not justified in increasing the charges for current by 10 per cent.

Australia.—Members of the Melbourne Council recently visited the Spencer Street power house, where a water-tube boiler has been equipped with a furnace for burning brown coal. The experiment is stated to be quite satisfactory, the full boiler output being maintained. It has been found that brown slack coal also gave good results; at present there is no market for this coal.

Blackpool.—WAGES.—The War Bonus Sub-Committee has considered the application on behalf of the employés in the electricity works for a war bonus of 15s. week, and has decided to offer the same sum as was recently awarded workers in other departments—12s. a week. In the event of non-acceptance, the matter will go to arbitration.

The past six months' working of the Corporation electricity department shows an aggregate output of 2,649,261 units, an increase of 221,329 units on the similar period of last year.

Bolton.—PRICE INCREASE.—The Electricity Committee has approved a report submitted by the electrical engineer on the question of increasing the price of current owing to the increased cost of coal, and has decided that the following advance over the prevailing prices should take effect as from the commencement of the current quarter:—Ordinary power consumers, 1d. per unit; lighting supply consumers, 1d. per unit; and traction supply, subject to the approval of the B. of T., 10d. per unit.

Bradford.—The latest establishments to adopt electricity for driving purposes are a new mill just completed for Messrs. Jeremiah Ambler & Sons, one of the pioneer woollen firms, and Dockfield Mills, Shipley, for the completion of which Government licence has been secured.

The Chamber of Trade has decided to support the National Chamber's petition to the Government (originated by the Leeds Chamber) for the fixing of definite uniform times of shop lighting restriction to cover the period of a month, during each month of the winter, based on the sunset conditions of the various parts of the country, instead of the present confusing system of a change of time every evening.

Bristol.—YEAR'S WORKING.—The report of the year's working of the electricity department to March 31st last shows gross receipts amounting to £143,923, an expenditure of £98,318, and a gross profit of £45,571, which, with the amount transferred from redemption and sinking fund (No. 2) account, makes a total of £16,111. After repayment of loans and interest, £18,373, there was a net loss on the year's working of £2,232. The credit balance brought forward from last year's account was £9,292, which, with adjustment of income-tax (1915-16), £1288, made a surplus of £10,580, which has been appropriated as follows:—Loss on year's working, £2,232; allowance to employés on active service, £3,398; and £4,968 on work not chargeable to loan account, leaving a balance of £72 to carry forward to next account. The outstanding debt amounts to £517,566. The total number of consumers was

5,736, a net increase of 128 during the year. The number of units sold was 23,579,139, an increase of 1,913,171. The general manager, Mr. H. Faraday Proctor, in his report states that the 3,000-kw. turbo-generator, sanctioned by the L.G.B. last year, had been delivered, and was expected to be in full running order during the autumn; but the load had so increased, that further plant was absolutely necessary. On the initiation of the Government scheme at Henbury, arrangements were made for co-operative working between the electric generating stations of the respective departments, with a view to the works of the Government being taken over by the Corporation after the termination of the war; the Government purchased a further 6,000-kw. generator in addition to those already on order for its own requirements for the more particular use of the Bristol Corporation Electricity Department to meet the growing demands. The stoppage of the works at Henbury had placed the Corporation electricity undertaking in a difficult position as regards meeting future requirements, as the Feeder Road station had its full complement of plant, and the Henbury scheme was being relied on. The engineer further states that arrangements for either the extension of the existing station at Feeder Road, or the construction of a new station on a large scale is therefore difficult, pending the advancement of the general scheme of organised electricity supply being considered by the Government, and it is particularly regrettable that the purchase of the 6,000-kw. generator sanctioned by the Council in May, 1915, was not approved by the L.G.B., the added load having already almost taken up the capacity of the smaller set to which the Corporation was then limited by the Board. Of the £23,056 increase in working costs, £16,011 represented the additional cost of coal.

Ealing.—The T.C. has received a letter from the Commissioner of Police requesting the resignation of members of the electricity staff who had enrolled as special constables. The Town Clerk explained that this was the outcome of the Council's reply to a letter from the Commissioner respecting the payment of compensation for injury sustained in the course of duty by special constables enrolled for the purpose of protecting their employer's premises. The borough electrical engineer had applied for long-service badges for these men, but the request was refused. It was decided that the Town Clerk should point out that the men were enrolled three years ago, and that during that period the liability of the police authorities regarding the payment of compensation had not been questioned. It was also resolved to say that it would be an ungracious act to ask the men to resign at this juncture because the Council declined to accede to a demand which did not appear to be justified.

Greenock.—PROPOSED LOANS.—The Corporation last week decided to apply to the Secretary for Scotland for sanction for power to borrow £53,000 for the electricity undertaking. It was stated that £6,000 was required to complete old contracts, £13,000 for additional mains and services in Greenock and £8,000 in Port Glasgow, £10,000 for land and property extensions at Dallingburn power station, and £16,000 for transforming plant and switchgear. The total of £53,000 will cover the immediate requirements, but in the near future further expenditure will be necessary.—*Glasgow Herald*.

Liverpool.—OUTPUT FIGURES.—The Corporation Electricity Department has made considerable progress during the past 12 months. There are now about 12,400 consumers, an increase of 400 in the year. Close upon 61,000,000 units were supplied for lighting, power and traction purposes, an increase of nearly 7 million units. During the first eight months of the present year there was an increase of 5 million units, or 13 per cent., as compared with a similar period last year.

London.—P.L.A. REPORT.—The report on the work of the Port of London Authority for the year to March last mentions that at the Royal Albert Dock 43 new electric cranes and a new crane track and conduit have been completed, and progress has been made with the provision of electric pumping plant for the dry docks.

At Tilbury three transit sheds, with 12 electric cranes, have been completed.

Loughrea.—The Town Commissioners decided to approach the Electric Lighting Co. with a view to the utilisation of electricity for the purpose of a new milling industry. Mr. Cahill said that after providing the town with light, something like 1,500 h.p. was being wasted, and might be turned to profitable account in the direction indicated. The L.G.B. has declined to sanction an increase from 6d. to 8d. per unit on electricity supplied by the company to the workhouse, stating that it does not consider the Guardians have power to increase the price agreed upon with the company in 1914.

Nuneaton.—LOAN APPLICATION.—The T.C. has applied to the L.G.B. for sanction to a loan of £575 for money overspent on machinery, £785 for excess expenditure on mains and services, and £2,140 for new mains and services and costs of raising the loan.

Oldham.—HOUSING SCHEMES AND ELECTRIC LIGHTING.—Acting on the request of the L.G.B. which has promised substantial financial assistance, local authorities in Lancashire, as elsewhere, are busy preparing big housing schemes to meet the great shortage which will exist in most districts after the war. This should mean a considerable extension of electric lighting. At Oldham there is a proposal to erect 500 houses, and at the meeting of the local Electricity Committee, Mr. Chamberlain, one of the joint engineers, stated that he had written to the borough surveyor, expressing the hope that the claims of the electricity department would not be overlooked when the question of the

means of lighting the proposed houses came to be considered. In the letter he pointed out that at present there were about 100 small houses, rented at about 5s. 6d. a week clear, which were electrically lighted. Mr. Chamberlain told the Committee that the old fetish that electric lighting was a matter for the big house only ought to have been dead long ago, and the present scheme, if carried out, would provide a splendid opportunity for that department.

Rochdale.—As a result of the extra cost of coal, the question of an increase in the charges for electricity is under consideration. There is now a coal clause in connection with the main contracts with consumers.

Southend.—INQUIRY.—A L.G.B. inquiry was held on Tuesday, last week, regarding the proposal to borrow £45,520 for the provision of additional generating plant at the electricity works, and for £1,150 for electric vehicles for the collection of horse refuse.

Tipperary.—The B. of G. proposes expending £100 on the renovation and improvement of the workhouse electric lighting plant.

TRAMWAY AND RAILWAY NOTES.

Australia.—ELECTRIFICATION OF THE VICTORIAN SUBURBAN RAILWAYS.—The Railway Commissioners have announced that, to enable the electric trains to be run during the first half of next year, special arrangements had been made to secure from America some of the gear necessary to inaugurate the service. The scheme had reached a stage where the installation of a small quantity of additional plant would allow trains to run on the Sandringham-Essendon line, and a relatively small portion of the rotary converting plant, transformers, and switchgear essential to the commencement of electric traction has been ordered from the General Electric Co. (U.S.A.), which is the contractor for the electrical equipment of the suburban rolling stock, and the original orders placed in Great Britain for the gear have been cancelled, so that no extra expense will be incurred by the transfer.—*Melbourne Age*.

Bingley (Yorks.)—The Council has decided to apply to the B. of T. for prolongation of the time by two years for the completion of the tramway at Crossflats. This step does not materially affect the proposed (after-war) linking-up of the Bradford, Bingley, and Keighley tramways between Crossflats and Stockbridge. It is an additional extension on the war-time extension already granted.

Birmingham.—ARTERIAL ROADS.—The City Council has adjourned consideration of the recommendation of the Public Works Committee favouring the widening of the chief arterial roads and the construction of a separate track system for tramways. The subject is to be discussed by the chief Committees of the Council, and there is good reason to believe that the scheme will again be submitted for adoption within the next three or four months.

Blackpool.—YEAR'S WORKING.—The annual report of the Corporation tramways for the year ended March 31st last, shows a total revenue of £94,367, working expenses amounting to £53,229, and a gross profit of £41,138; interest and sinking fund charges absorbed £19,956, leaving a net profit of £21,182, which has been disposed of as follows:—For the relief of rates, £10,000; permanent way renewal fund, £9,000; to reserve fund, £2,182. The total amount at the credit of the reserve fund is now £9,142, and of the renewals fund £30,542. The passengers carried numbered 17,810,538; the car-mileage was 1,131,728, showing an increase of 3,224,687 passengers and 62,201 miles during the year. The average total revenue per car-mile was 20.01d.; the average working expenses per car-mile, including power, were 11.29d.

At a meeting of the Tramways Committee, Mr. Charles Furness, general manager, reported that when conditions allowed he should apply for permission to purchase about 16 additional cars, bringing the total up to about 100. At the same time he recommended, in view of depletion of staff, that application be made to the B. of T. for permission to use trailer cars. This would increase the carrying capacity from 50 to 80 per cent., and only an additional conductor would be required. The Committee approved the recommendation, and application is to be made as suggested.

A recommendation by the Watch Committee that a double set of lines should be placed at the Dickson Road terminus of the Blackpool and Fleetwood Tramroad Co., was deferred until the present lease expires in July, 1919.

Bradford.—WAGES.—The Corporation tramway workers, numbering about 1,000, through the local branch of their Union, are applying for a wages advance of equal to £1 per week on pre-war rates. They are already in possession of advances up to 12s. per week in addition to receiving time and a-half pay for overtime. The new demand would cost the department £42,000 a year. The Tramways Committee states that the advance is impossible without a material increase in fares. The Committee has recommended to the War Wages Committee that the application be not granted, but it is willing to go to arbitration.

TRAFFIC RETURNS.—The city's tramway receipts for the half-year ending September 30th were £203,590, an increase of £19,000 on the corresponding period last year. The total expenditure includes £22,000 in war wages and bonuses, an increase of £14,000, in addition to which £10,000 (an increase of £1,000) has

been paid in war allowances. The car-mileage was 3,052,000, a decrease of 107,000. The passengers carried numbered 42,893,000, an increase of 745,000, averaging 127 journeys for the whole population, an increase of 16 journeys.

Continental.—SWITZERLAND.—The Swiss Locomotive and Machinery Works Co., of Winterthur, which has just declared a dividend of 7 per cent. for 1916-17, as in the previous year, reports that the Federal Railway Administration has definitely allocated to the company an order for the mechanical parts of the four experimental electric locomotives for the St. Gothard Railway.

Edge Hill Light Railways.—An application was recently made to the Light Railway Commissioners for an order authorising various lines in the district between Stratford-on-Avon and Banbury, covering about 11 miles. The railways are to deal with minerals, though passenger-carrying powers are included; it is apparently intended to adopt electric traction, as powers are sought for the erection of a generating station.

Huddersfield.—WAGES.—The existing war bonus of 10s. per week paid to adult male tramway employees is increased to 11s. per week; those of the female employees (1s. 6d.) and boys (5s.) are increased by 2s. each, with certain conditions as to overtime work. The increased bonuses are retrospective to September 19th.

Lancashire.—TRAMWAY WAGES AWARD.—The recent award to the tramway workers of Lancashire is now being regarded as even more favourable to the employees than was at first apparent. The arbitrator, on a point of appeal, has decided that the award of 12s. for men and 9s. for women applies to a six-day working week, and that if an employee works seven days he is entitled to an extra amount. As, owing to the reduction in staffs, the seven-day week is fairly general, this will mean an increase of 11s. a week. In Bolton, where a 13-day fortnight arrangement has been in vogue, the general manager has been authorised to prepare a scheme for a six-days' week.

Liverpool.—The Corporation Tramways have carried nearly ten million more passengers during the past nine months as compared with 1916, and although there was a decrease in the mileage run of 90,303 miles, the receipts, which were £603,317, showed an increase of £53,417 upon those of the corresponding period of last year. The earnings per car-mile were 1s. 3.43d., as against 1s. 88d. Some 2,200 employees have joined the Forces, and this fact, with the difficulty of obtaining supplies, has involved strenuous conditions.

London.—The Lewisham B.C., having regard to the improving receipts of the L.C.C. tramways, has directed that they should be included in a provisional valuation list for reassessment.

Londonderry.—A member of the Corporation having declined to negotiate with that body for the use of land in connection with the proposed city electric tramway service, the Corporation decided to acquire the land compulsorily.

Warrington.—The T.C., in sanctioning increased fares on the tramways, was told by Alderman Wilkinson that war bonuses were costing the Corporation £3,600 a year. Prior to the war, in 1914, the working cost per car-mile was 8d., and they could make money on that basis, but the cost had now risen to 11½d. per car-mile.

TELEGRAPH AND TELEPHONE NOTES.

Argentina.—The high-power wireless station which, with the consent of the Argentine Government, has been erected, under the supervision of Messrs. Siemens-Schuckert, in the vicinity of the station of Plomer is designed to communicate with the high-power station at Nauern, near Berlin, the distance between the two stations being about 13,000 kilometres. Signals from Germany have already been received, but the prevalence of strong atmospherics has so far prevented them from being intelligible.—*Review of the River Plate*.

Australia.—Orders aggregating 1,000 lines of automatic central-office equipment and 1,000 telephones equipped with the dial have just been placed, to be used as additions to the automatic exchanges in Australia. This is the second set of orders placed since the beginning of 1917, the first one—for 1,800 lines—being received in February.—*T. and T. Age*.

The Minister for the Navy recently stated that £55,000 had been spent in the purchase of wireless workshops and plant at Randwick, Sydney, and there were now 81 men employed there.—*Melbourne Age*.

Holland.—In confirmation of the report that there is wireless communication between Holland and foreign countries, via Berlin, the Amsterdam *Telegraaf* states that commercial telegrams are arriving in Holland by this route.—*The Times*.

Telephoning During Air Raids.—The Postmaster-General earnestly appeals to the public to refrain from using the telephone during and immediately after an air raid. Private calls must necessarily give way at such times to urgent calls of public and national importance.

CONTRACTS OPEN AND CLOSED.

OPEN.

Dublin.—November 1st. G.N. Railway Co. (Ireland). Six or twelve months' supply of general stores (including several electrical items). See "Official Notices" October 5th.

Grimsby.—October 29th. Corporation. House service boxes and house fuse-boxes and fittings. See "Official Notices" October 12th.

Spain.—The municipal authorities of Uruena (Province of Valladolid) have just invited tenders for the concession for the electric lighting of the town during a period of 15 years. Tenders have also lately been invited by the municipal authorities of Villadefrades, in the same province, for the concession for the electric lighting of the town during a similar period.

York.—November 2nd. N.E. Railway. Telegraph stores for six and twelve months. See "Official Notices" to-day.

CLOSED.

Government Contracts.—List of new contracts placed during September, 1917:—

WAR OFFICE.

Generating sets.—R. A. Lister & Co., Ltd.
Motors.—Electric Construction Co., Ltd.; F. Parkinson & Co.; Rhodes Motors, Ltd.
Transformers.—Harland Engineering Co.
Iron wire.—Dorman, Long & Co., Ltd.; Firth & Co., Ltd.; Guest, Keen and Nettlefolds, Ltd.

INDIA OFFICE STORE DEPARTMENT.

Alternators.—Crompton & Co.
Cells.—Siemens Bros. & Co.
Cells and dynamos.—J. Stone & Co.
Copper plates.—Williams, Foster & Co.; Pascoe, Grenfell & Son.
Gutta-percha sheet.—Siemens Bros. & Co.
Wire.—Whitecross Co.; Shropshire Iron Co.; R. Johnson & Nephew.

H.M. OFFICE OF WORKS.

Engineering services.—Electric wiring, &c., new Court House, Newington Causeway; Lund Bros. & Co.
Ordnance Survey Office, overseas.—Electric generating plant: Harland Engineering Co.

POST OFFICE.

Telegraph apparatus.—Automatic Telephone Mfg. Co., Ltd.; General Electric Co., Ltd.; I.R., G.P. & Telegraph Works Co., Ltd.; Telegraph Condenser Co., Ltd.; H. White & Co.
Telephone apparatus.—British L. M. Ericsson Mfg. Co., Ltd.; General Electric Co., Ltd.; Western Electric Co., Ltd.
Submarine cable.—Telegraph Construction and Maintenance Co., Ltd.
Telegraph cable.—Connolly Bros., Ltd.
Telephone cable.—B.I. & Helsby Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; W. T. Glover & Co., Ltd.; Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; C. Macintosh & Co., Ltd.; Peel-Conner Telephone Works, Ltd.; Siemens Bros. & Co., Ltd.; Union Cable Co., Ltd.; Western Electric Co., Ltd.
Leclanché cells.—Siemens Bros. & Co., Ltd.
Insulators.—Bullers, Ltd.
Stay-rods.—Bayliss, Jones & Bayliss, Ltd.
Zinc rods.—Eyre Smelting Co., Ltd.
Bronze wire.—B.I. & Helsby Cables, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co. (incorporated in the London Electric Wire Co. and Smiths, Ltd.).
Copper binding wire.—B.I. & Helsby Cables, Ltd.
Covered copper wire.—Concordia Electric Wire Co., Ltd.
Copper line wire.—T. Bolton & Sons, Ltd.; B.I. & Helsby Cables, Ltd.; Elliott's Metal Co., Ltd.; Johnson & Nephew, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co. (incorporated in the London Electric Wire Co. & Smiths, Ltd.); Wilkes, Sons & Mapplebeck, Ltd.
Voids.—Brunner, Mond & Co., Ltd.

London.—**ST. PANCRAS.**—The Borough Council has accepted an offer of Messrs. Bruce Peebles & Co. to supply an additional 1,000-KW. motor-converter for £4,000.

HAMMERSMITH.—The Electricity Committee recommends that the offer of Messrs. W. B. Dick & Co., Ltd., be accepted for the supply of cylinder oil for 18 months from September 25th, 1917, at 3s. 6d. per gallon.

Taunton.—**T.C.** 2,500 tons of Russell's Black Vein washed bean coal for the electric light works: Cory Bros. & Co., Ltd., at £1 9s. 9d. per ton, an advance on the last contract of 7½d.

Transformer and Meter Contracts.—Messrs. Ferranti, Ltd., have received the following contracts:

Yorkshire Electric Power Co.—One 150-K.V.A. and one 200-K.V.A. 3-phase transformer.
British Cellulose & Chemical Mfg. Co., Ltd.—Three 10,000-K.V.A. 3-phase transformers for furnace work (secondary current 50,000 amps.).
Stockton-on-Tees Corporation.—Annual contract for c.c. meters.
Redditch Urban District Council.—Annual contract for a.c. meters.

FORTHCOMING EVENTS.

Physical Society of London.—Friday, October 26th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Papers on "A Class of Multiple Thin Objects," by Mr. T. Smith, and on "The Radius of the Electron and the Nuclear Structure of Atoms," by Prof. J. W. Nicholson.

Association of Supervising Electricians.—Tuesday, October 30th. At 7.15 p.m. At St. Bride's Institute, Bride Lane, E.C. Paper on "Switchboard Telephone Equipments," by Mr. T. P. Lee.

Salford Technical and Engineering Association.—Saturday, November 3rd. At 7 p.m. At the Royal Technical Institute, Peel Park. Members' short papers for gold medal given by Mr. W. O. Larmouth.

NOTES.

Volunteer Notes.—**COUNTY OF LONDON VOLUNTEER ENGINEERS (FIELD COMPANIES).**—Headquarters, Balderton Street, Oxford Street, W. 1.

Orders for the week, by Lieut.-Colonel Clay, V.D., commanding:—
Officer for the Week.—Lieut. W. J. A. Watkins.
Drills.—Week ending Sunday, November 4th, 1917:—
Monday.—No. 3 Company, Left Half. Recruits, signalling, 6.30.
Tuesday.—Physical drill and bayonet exercise, 7.30.
Wednesday.—No. 1 Company, 6.30.
Thursday.—No. 2 Company, 6; signalling, ambulance, 6.30.
Friday.—No. 3 Company, Right Half. Recruits, 6.30.
Sunday.—Commandant's Parade. Parade Waterloo Station, opposite No. 10 Platform, 8.45 a.m., for work at Esher. Uniform. Mid-day rations to be carried. Compulsory for A and B men.
Musketry.—Belvedere Road. Tuesday, Wednesday, and Thursday, 5.30 to 7.
Note.—The Medical Officer will attend for examination of recruits, &c., on Thursday, at 6.
All enamelled cap badges must be returned to the Quartermaster-Sergeant without delay.
The Regimental Tailor will attend on Tuesday, October 30th, at Headquarters, at 6.30, to measure for uniforms.
Unless otherwise indicated, all drills will take place at Headquarters.
(By order) MACLEOD YEARSLEY, Capt. and Adjutant.

Metropolitan Association of Electric Tramway Managers.

—A meeting of the members of this Association was held at the Municipal and County Club, Whitehall, on Friday last, when there were present:—Messrs. Ullmann (East Ham), Harvey (Ilford), Hammond (Met. Electric), Williams (Erith), Stokes (Bexley), Mason (South Met.), Mackinnon (L.U.T.), and Goodyer (Croydon). Messrs. Ullmann, Hammond and Goodyer were respectively re-elected chairman, vice-chairman and secretary. A number of items on the agenda had to be left over for discussion at a subsequent meeting.

Municipal Trading: Our Obligations to Posterity.

The following is an extract from the report of the chairman of the Christchurch (New Zealand) Municipal Tramway Board for the year ending March 31st, 1917:—"Some day the New Zealand Legislature may recognise the advisability in view of the rapid increase in municipal trading concerns, of setting up a standard, as the result of the fullest investigation, for the guidance of those municipalities which desire to strike a true balance between the rival interests of the present generation, which wants to get as many benefits as possible from its municipal trading concerns, and the coming generation, which, while undertaking its own new burdens, should not receive, by way of legacy, obligations which should have been met by its forefathers."

Appointments Vacant.—Chief assistant engineer, for the Fleetwood U.D.C. electricity works, £150; mains engineer (£3) for the Lowestoft Corporation electricity and tramways departments; shift engineer (£220) for the Manchester Corporation electricity department; assistant electrical engineer for the Bnxtion Corporation electricity undertaking; charge engineer (50s.) for the L.C.C. Tramways Department; meter repairer (45s.) for the Luton Borough Electricity Works. See our advertising pages to-day.

Central Station Employes: St. Pancras Proposals.

In view of the general increase of wages throughout the country to employes engaged in electrical undertakings, the St. Pancras Borough Council has secured information regarding the rates paid by other municipal undertakings, and, as a result, the Electricity Committee makes the following recommendations:—

	Present maximum weekly wages.	Revised maximum weekly wages as recommended.
Station superintendent (King's Road)	£208 + 25 + 17 = £250 per annum; present salary £233 per annum	To receive maximum salary of £250 forthwith, instead of on Dec. 16th next, when it becomes due. £200 to £225 per annum, paid monthly.
Chief assistant (Regent's Park)	£3 10s. per week	
Shift engineers (King's Road)	£3 0 0	£3 15 0
Shift engineers (Regent's Park)	2 10 0	3 5 0
Sub-station electrician	2 0 0	2 12 6
Switchboard attendants	1 10 0	2 0 0
Engine drivers	2 0 0	2 7 6
Condenser hands	1 12 6	2 0 0
Cleaners	1 10 0	1 15 0
Boiler foreman	3 5 0	3 10 0
Stokers (per shift)	5s. 3d. per shift	6s. 6d. per shift.
Trimmers	4s. 4d. per shift	5s. per shift.
Storekeeper (King's Road)	£1 17 6	£2 0 0
Storekeeper (Regent's Park)	1 15 0	1 17 6
Mains superintendent (out-doors)	4 10 0	No alteration.
Mains superintendent (in-doors)	4 0 0	No alteration.
Meter and installation superintendent (Vacant)		
Meter and installation assistant	£2 5 0	£2 10 0
Meter repairer	2 0 0	2 5 0
Meter inspector and repairer	1 17 6	2 2 6
Meter exchangers	1 12 6	1 17 6
Boys, 14—16 years of age	0 10 0	10s. to 15s.
Youths, 17 years and upwards	1 5 0	£1 to £1 5s.
Improver	1 7 6	£1 to £1 7s. 6d.
Carpenter	2 5 0	£2 10 0
Storekeeper (mains department)	1 15 0	1 17 6
Arc lamp foreman	2 2 6	2 10 0
Assistant arc lamp foreman	2 0 0	2 5 0
Arc lamp trimmer	1 15 0	1 17 6
Arc lamp repairer	1 15 0	1 17 6
Cable jointer (sen.)	2 5 0	2 10 0
Cable jointer	2 2 6	2 7 6
Cable mates	1 12 6	1 17 6
Ganger	1 17 6	2 2 6
Manhole inspector	1 12 6	1 17 6
Wireman, first	2 0 0	2 5 0
Wireman, second	1 15 0	2 0 0

Inquiries.—Makers of machines for the manufacture of litharge perforated lead sheet and moulding lead grids for accumulators are asked for.

Institution and Lecture Notes.—**Belfast Association of Engineers.**—The new session opened last night (Thursday) with the presidential address of Mr. A. M. I. Cleland on "The Relations between Employer and Worker." Other events in the programme are:—

December 20th.—"Electro-Metallurgy," G. L. Roslyn.
January 17th, 1918.—"Past, Present, and Future of the Internal-combustion Engine," Prof. J. H. Smith, D.Sc.
February 21st.—"Decimal System," Dr. W. J. Crawford.
March 21st.—"The Panama Canal," J. Milne Barbour, D.L.

Institution of Engineers and Shipbuilders in Scotland.—The report of the Council for the year ending on September 30th, 1917, shows that the membership was 1,573, a decrease of 20 members. The income was £3,536, and the expenditure £3,413, leaving a surplus of £123.

Greenock Electrical Society.—The opening meeting of the session took the form of a whist drive in aid of Red Cross funds on October 18th. The honorary president, Mr. Hugh Ferrier, gave a short address on "Technical Education."

Manchester Association of Engineers.—At the first meeting of the session, on October 13th, the president, Mr. J. P. Bedson, delivered an address in which he referred to the mineral riches of Alsace-Lorraine, Belgium, and the North of France, which Germany desired to secure; and afterwards dealt with the importance of unified control of all transport facilities in this country. As an instance of what the British manufacturer was up against in the matter of transport cost, he said that before the war Belgian nail-makers, buying their rods in Germany, 400 miles from their own works, could get them delivered for 1s. 6d. per ton by water, and could deliver into the Thames for 5s. per ton, a total of 6s. 6d. per ton, whereas delivery from Manchester would have cost at least 15s. per ton. The cost of railroad transport in this country was 1'192d. per ton per mile, as compared with France 0'726d., Germany 0'637d., Holland 0'590d., Norway 0'867d., and Denmark 0'956d., the main reason for the high cost of transport in this country being our neglect of water transport. Canal and river transport on the Continent had been developed to a remarkable extent. The ton-mile traffic on the Rhine alone was 4,025,660,000, that on the Elbe 2,222,080,000, on the Seine 610,000,000, on the St. Quentin 291,075,000, and on the Scheldt 177,673,000. To reach that level in this country he imagined State aid would be necessary, and should a Ministry of Commerce be appointed, the State might be led to realise that our canals should be improved, utilised, and nationalised at the very earliest moment: in fact, they should be made free, on the same principle as highways.—*Colliery Guardian.*

Institution of Electrical Engineers.—The opening meeting of the 1917-18 session will be held on Thursday, November 8th, at 6 p.m., preceded by light refreshments at 5.30 p.m. Mr. C. H. Wordingham will deliver his inaugural address, and the premiums will be presented. By kind permission, the meeting will be held at the Institution of Civil Engineers, Great George Street, S.W.

Lancashire and Cheshire Linking-up Scheme.—The question of the linking-up of Lancashire and Cheshire electricity undertakings is to be further discussed at a conference which is to be held in Manchester next month. The second report of the Inter-connection Committee will be considered, and opposition will then be forthcoming from several of the authorities interested in the suggestion contained in the report, that the Joint Board shall be invested with powers to acquire, when and where necessary, the ownership and control of existing power stations.

A meeting of "Group C" has been held at Stalybridge, at which there were present representatives from the boroughs of Ashton-under-Lyne, Oldham, and Stockport, the Stalybridge Joint Electricity Board, and the Glossop Electric Lighting Co. After full discussion of the report, it was unanimously decided to express agreement generally with the proposals for linking-up the electricity undertakings in the Lancashire and Cheshire area, but stating disagreement with that portion of the report which refers to the conferment of additional powers upon the proposed Joint Board in regard to the establishment and control of all future and existing power stations and high-pressure transmission lines. The view was expressed that the idea of supplying the whole of the district concerned with current produced from one central generating station would probably mean an increase in the price for lighting, and certainly an increase in the price of current for power purposes.

Reference to the matter was made at a recent meeting of the Oldham Corporation Electricity Committee. Coun. Jackson said that the price at which it was proposed to supply current under the scheme was in excess of the figure at which Oldham were able to supply at present; in fact, the proposed price was a farthing per unit higher than Oldham's charge. The idea of linking-up electricity stations was all right, but he took exception to that part of the scheme which might simply reduce the Oldham works to the level of a distributing station. Coun. Frith said that the biggest difficulty they had was the fact that they could not buy machinery. When the war was over, and they could get the requisite plant, they would be able to supply current cheaper than at present, and at a rate that would be far less than that proposed under the centralised scheme, which he thought was altogether too big to be workable.

British Dyes, Ltd.—In the annual report it is stated that the electrical installation has been completed, and both the old and new works are now entirely operated by the company's own plant. A power gas plant has been completed, and is in

operation. A pipe system for the distribution of gas, steam, and compressed air throughout the works is approaching completion.

The Association of Electrical Station Engineers of London.—The following letter has been received by this Association from the Chief Industrial Commissioner's Department, Ministry of Labour, Whitehall, S.W., by the Association:—

"With reference to your letters of the 19th and 20th inst., I am directed by Sir George Askwith to say that, so far, no agreed conference has taken place. Such a conference is only being arranged between the parties, and he would suggest that you should communicate with Mr. Edward Calvert, Hon. Sec., Associated Municipal Electrical Engineers, Electricity Works, Squire's Lane, Finchley, with a view to being represented at the conference."

Accordingly, the hon. secretary of the Association, Mr. W. A. Jones, A.M.I.E.E., wrote to Mr. Calvert as follows, on October 22nd:—

"re Conference between the A.M.E.E., E.T.U., and Representatives of London Borough Councils.

I beg to enclose herewith a copy of a letter from the Chief Industrial Commissioner with respect to a claim made by this Association to represent power station engineers-in-charge and technical assistants at the above conference.

I enclose a list of the London power stations, the staffs of which are represented by this Association. Such further information as you may require to substantiate the claims made by this Association I shall be pleased to supply.

In view of the close proximity of the commencing date of the conference, I shall be glad to receive your assurance, at the earliest possible moment, that facilities will be granted for this Association to be represented."

We are informed that a circular is being addressed to the London power stations in the terms given below:—

A representative Committee with executive powers has been formed to deal with the following matters:—

1. All questions arising out of and in connection with the conference between the A.M.E.E. and E.T.U. under the presidency of Sir Geo. Askwith.

2. To plan the reconstruction of the London division of the above Association.

The constitution of the Committee is as under:—

Chairman: Mr. H. W. Healy (Battersea).

Hon. Sec.: Mr. Arthur Jones, A.M.I.E.E. (Leyton).

Committee: Mr. E. N. Christmas (Islington); Mr. C. Cox (L.N.W. Railway, Stonebridge Park); Mr. W. Wilcocks (Hammer-smith); Mr. A. J. Giffin (West Ham).

Pending the full development of the reconstruction, of which you will receive notification in due course, three geographical divisions have been created, viz.:—West; North Central; East.

The appended tabulation will clearly indicate this sub-division, together with the officers acting for each division.

WEST.	NORTH CENTRAL.	EAST.
Mr. H. W. Healy (Battersea).	Mr. J. Cox (L.N.W.R., Stonebridge Park).	Mr. A. Giffin (West Ham).
Mr. Wilcocks (Hammer-smith).	Mr. E. N. Christmas (Islington).	Mr. W. A. Jones (Leyton).

STATIONS.		
Acton.	City of London.	Barking.
Battersea.	County of London (City Road).	Beckenham.
Barnes.	Central Elec.	Bermondsey.
Brompton and Kensington.	Finchley.	Blackheath S. Met.
Chelsea.	Hackney.	Bow (C.X. and City).
Chiswick.	Hampstead.	Dartford.
Croydon.	Hornsey.	Deptford.
Ealing.	Islington.	Erith.
Fulham.	Lambeth (South London).	East Ham.
Heston and Isleworth.	Neasden (Met. Rail.).	Ilford.
Kingston.	St. Pancras.	Leyton.
Kensington and Knightsbridge.	St. Marylebone.	Poplar.
Lots Road.	St. James' and Pall Mall.	Stepney.
Twickenham.	Westminster Elec. S.	Southwark.
Wandsworth.	Watford.	Shoreditch.
Wimbledon.		Walthamstow.
Wimbledon (L.S.W. Railway).		West Ham.
Willesden (North Met.).		Woolwich.

All inquiries concerning the Association should be directed to the officers in control of your division.

Membership of the Association embraces the following grades of engineering assistants:—

Engineer-in-charge.	Meter superintendents.
Assistant engineer-in-charge.	Draughtsmen.
Junior in-charge.	Testing engineers.
Mains assistants.	Publicity engineers.

The Association at present includes in its membership a number of senior technical or administrative officers. Engineers holding this rank are invited to communicate direct with the Hon. Sec., Mr. W. Arthur Jones, A.M.I.E.E.

Applications for membership will only be considered from fully qualified engineers, and should be made direct to the officers in control of your division.

H. W. HEALY (Chairman of Committee).
W. A. JONES, A.M.I.E.E. (Hon. Sec.).

Engineering Training.—Yesterday afternoon a meeting was to be held at the Institution of Civil Engineers, to form a Central Organisation for improvement in and better co-ordination of engineering training, and to appoint a representative committee of engineering and educational interests to initiate action in the matter. The proposal arises out of an informal conference of engineers and educationalists, which held several meetings at the Board of Education early this year.

The conference presented a memorandum to the Board suggesting that a bureau might be established within the Department, and the suggestion received strong support from professional men, accompanied, however, by an expression of opinion that an independent organisation would be preferable. Mr. Fisher, President of the Board, agreed with this view, and the meeting was accordingly convened. A report will appear in our next issue.

Engineering in China.—At the Engineers' Club, Manchester, on Tuesday evening, Mr. S. W. B. McGregor, who for some years represented a group of British manufacturing engineers in Shanghai, opened a debate on "The Commercial Aspect of Engineering in China."

Late Legal.—OSRAM LAMP WORKS v. POPE'S ELECTRIC LAMP Co.—Yesterday, by a majority of three to two, the House of Lords decided the above case in favour of the Osram-Robertson Lamp Works, Ltd., with costs.

OUR PERSONAL COLUMN.

Central Station and Tramway Officials.—The Preston Corporation Tramways Committee recommends the appointment of Mr. HENRY CLAYTON as assistant engineer and manager at £200 a year.

The Electricity Committee of St. Pancras Borough Council recommends that the salary of Mr. T. W. MERRY, superintendent at the King's Road Station, be increased from £233 per annum to the maximum of £250 per annum forthwith.

Blackpool Electricity Committee has appointed Mr. GEORGE YATES electrical fittings superintendent at £200 per annum, rising by annual increments of £25 to £250; Mr. HERBERT MAKIN to be salesman and chief clerk, at £180, rising by £10 to £200; Mr. WALTER UNSWORTH to be invoice and ledger clerk, at £150, rising to £160 at the end of 12 months; and Mr. F. W. LEATHERBARROW to be stores clerk in the electricity department at £135, rising to £150.

Barnes U.D.C. has increased the salary of Mr. CORNET, shift engineer at the electric light works, from £160 to £180 a year, and his war bonus from £16 to £18 per annum.

General.—Mr. E. W. FLOWER has resigned the office of president of the Federated Electrical Trades Union of Australia (N.S.W. Branch). In his letter to the Union, which is prominently published in the Australian Press, he says:—

"The obligations which I have taken, and which are numerous, are of such a character that I feel I cannot allow myself to be associated any longer with this strike. I have endeavoured to remain loyal to my Union at all times, and I trust I have proved so, but the conditions of my country compel me at this hour to go, and which is I think and right. I cannot consider my co-operation here longer; and I thank you, and would ask you to do so, for this forthwith."

Mr. Flower has resumed duty in the railway department.

On October 22nd a presentation was made to Mr. MALCOLM BREINGAN, manager of the Glasgow branch of the Western Electric Co., Ltd., by friends in the electrical trade on the occasion of his approaching marriage. The presentation took the form of a handsome salver, uniquely decorated with facsimile initials of the donors.

Mr. G. W. TEMPEST, chief engineer for the Lancashire and Yorkshire Private Telephone Co., Manchester, has been married at Heptonstall (Yorks.) to Miss Ethel Sutcliffe. From his employers, Mr. Tempest received a cheque and dinner service.

At Manchester, on Saturday last, the wedding was solemnised of Miss VERA FERRANTI, daughter of Dr. S. Z. de Ferranti, of The Hall, Baslow, and Lieutenant ERLING ORD, Canadian R.A.M.C., who holds the Croix de Guerre. Lieutenant ORD attended the bride's brother, Major Ferranti, who died of wounds in July, while he was in hospital, and he was entrusted with the late Major's last message home. It was in this way that he first met the lady who is now his wife.

At Brantford, Ontario, according to the *Times*, the Duke of Devonshire unveiled a monument to Dr. ALEXANDER GRAHAM BELL, inventor of the telephone. Dr. Bell and Mrs. Bell were present. Dr. Bell's first successful experiment was made in Brantford in 1871, and the Bell Homestead of 13 acres has been acquired by the Bell Memorial Association.

Roll of Honour.—Captain DESMOND GARDINER TROTTON, R.F.A., who, according to the *Times*, was killed on October 15th, took a degree in electrical engineering at University College, London.

Sergeant D. LIVINGSTON, R.F.A., who has fallen in action, was with Messrs. Richardson, Wetherth & Co., of Hartlepool.

Private D. L. JELST, Durham L.I., who was on the staff of Messrs. Richardson, Wetherth & Co., Ltd., Hartlepool, has been wounded in action.

Corporal R. A. KNIGHT, R.E., who has fallen in action, was on the staff of Mr. W. Rigden, electrical engineer, of Ramsgate.

Lance-Corporal F. ANDERSON, of the Croydon Corporation tramway staff, has died whilst on active service.

Corporal A. C. PEARCE, R.E., an overhead linesman on the Corporation tramways at Croydon, has been awarded the Military Medal.

Sapper J. F. BAGNALL, R.E., awarded the Military Medal for bravery in maintaining telephonic communication under heavy shell fire, was on the staff at Siemens Bros. Dynamo Works, Stafford.

Private W. F. WEBB, City of London Regiment (P.O. Rifles), killed in action, was a meter inspector in the Winchester Corporation electricity department.

Second-Lieutenant W. G. MANSELL, 3rd East Surrey Regiment, attached to the R.E.C., reported missing, and feared killed, was, on the outbreak of war, an electrical engineering student at the Battersea Polytechnic.

The Military Medal has been gained by Company Sergeant-Major UNDERWOOD, Royal Welsh Fusiliers, an inspector on the Mansfield & District Light Railways. On September 13th last he led a raid on the enemy trenches, and was instrumental in getting in all the wounded.

Private W. BRUFORD, who has died from wounds, was employed by Messrs. Dick, Kerr & Co., Ltd., Preston.

Private S. HENSHALL, of the Coldstream Guards, who has been killed in action, was employed by the Lancashire Electric Power Co.

Private E. HALL, Manchester Regiment, who died of wounds on October 10th, was employed by the British Westinghouse Co., Ltd., Trafford Park.

Sapper F. SMITH, R.E., who was wounded in France a fortnight ago, was employed in the Accrington Corporation electricity department.

Private E. SUMNER, severely wounded, was head clerk for the Alderley & Wilmslow Electric Supply Co.

Lance-Corporal J. WALMSLEY, L.N.L. Regiment, and Sapper R. C. BOND, R.E., both employees of Messrs. Dick, Kerr and Co., Ltd., Preston, have been killed in action.

Sergeant W. PALFRAMAN, holder of the D.C.M. and two Certificates of Merit for bravery in action, who was a former employee of the Bradford tramways department, was presented to the Tramways Committee last week whilst on leave. A resolution of hearty congratulation was accorded him.

Gunner R. BOXWORTH, R.F.A., who has died of wounds in France, aged 43, was employed by Messrs. Whipp & Bourne, electrical engineers, Castleton.

Private T. COOK, King's (Liverpool) Regiment, killed in action, was employed by Messrs. Dick, Kerr & Co., Ltd., Preston.

Sergeant J. DOYLE, recently awarded the Military Medal, has since died of wounds. He was for many years before enlistment a motorman on the Liverpool Corporation tramways.

Corporal P. WHITESIDE, R.F.C., who has been wounded, was an apprentice electrician with the Lancashire & Yorkshire Railway Co.

Private A. E. GOOD, Oxford and Bucks. L.I., who has fallen in action, was employed by the Electric & Ordnance Accessories Co., Aston.

Corporal E. P. MOORE, Machine Gun Section, formerly employed in the electrical laboratory of the B.T.H. Co., Rugby, has been killed.

Second-Lieutenant H. V. SCHOFIELD, who received his early training as an electrical engineer at the Whithy U.D.C. electricity works, has been appointed Adjutant of his Brigade, and will assume the acting rank of Captain.

Sapper J. MUGHAN, a Leeds electrical engineer, has been admitted to hospital suffering from trench fever.

Lance-Corporal W. KILLAN, Seaforth Highlanders, killed in action on October 12th, was employed by Messrs. C. Macintosh & Co., Ltd.

Sergeant J. SEAZEL, R.A.M.C., who has fallen in action, was formerly in the employ of Messrs. Messengers & Sons, electric lamp manufacturers, Birmingham. He had been recommended for the Military Medal.

The *Times* reports that Lieutenant (late Acting Captain) J. H. CARDEW, M.C., R.F.A., died of wounds on October 5th. He graduated with honours, specialising in electrical science, at the McGill University, Montreal. He was trained as an electrical engineer at the British Westinghouse Works, where he was captain of the Westinghouse Football Club. He entered the Indian Government service in 1909, and at the outbreak of war held the appointment of electrical engineer of the Oudh and Rohilkund and North-Western State Railways.

Obituary.—Mr. H. A. WROTTESELEY FANSHAW.—The death occurred in London, on October 18th, of Mr. H. A. Wrottesley Fanshawe, late of the Indian Government Telegraphs, at the age of 70 years.

Mrs. M. LONGRIDGE.—We regret to learn from the *Times* "Deaths" columns that Mrs. Michael Longridge has passed away in South Devon, at the age of 70 years. We desire to tender an expression of sympathy to Mr. Michael Longridge, President of the Institution of Mechanical Engineers, in which expression, we believe, we shall carry with us the feeling of a wide circle of friends and admirers.

Mr. J. J. KIRKHAM.—The death took place on October 15th of Mr. Joseph John Kirkham, manager of the works of the Deal and Walmer Gas & Electricity Co. He had held this position for 21 years.

CITY NOTES.**Dick, Kerr
and Co., Ltd.**

The report for the year ended June, 1917, states that the profits earned were £95,465, to which is added £20,397 brought forward. After paying debenture interest, trustees' fees, and premium on debenture stock redemption, the balance is £105,374. Six per cent. has been paid on the preference shares, 10 per cent. is recommended on the ordinary shares, £25,000 has been put to supplement special reserve for contingencies, and £56,074 is to be carried forward. The amount of excess profits levy has not been finally settled; the reserves are sufficient for extra depreciation, special taxation, &c. The work carried out by all departments on behalf of the Government has been of even greater magnitude than in the preceding year. The national factory mentioned in last year's report has been completed and organised, and was handed over to the Government as a going concern in July, thus releasing a number of members of the staff of the company for new development work in other directions. The company has acquired the control of the United Electric Car Co., Ltd., by the purchase of the greater part of the issued preference and ordinary shares of that company. Steps have since been taken to amend the Articles of the Car Co. so as to enable Dick, Kerr & Co. to retain control of that company so long as it continues to hold the ordinary shares, and the directors, therefore, intend to dispose of the preference shares so as to replace the capital of the company temporarily invested therein. Before offering the shares for sale elsewhere, the directors are inviting applications for them at par from share and debenture holders of D.K. & Co. The output of the Car Co. will be sold through D.K. & Co.'s selling organisation, and it is anticipated that a considerable increase in business and reduction in general and administrative expenses will result. Annual meeting: London, Oct. 31st.

The second annual meeting was held in **Erinoid, Ltd.** London on October 18th. The chairman,

Mr. ANDREW BINNIE, moved the adoption of the report, which recommended a dividend equal to 16½ per cent. per annum. For 1915 the trading profits were £5,825, for 1916 £9,472, for 1917 £22,191. They could not hope to continue to progress at that rate, but it was significant that the sales showed a continuous increase. The increased profits were not due to profiteering, but to natural growth of a new industry. The results had been achieved despite all the restrictions with which business was hampered to-day. The workers in the Stroud Valley were of a fine type, and their relations with them had always been of the most excellent nature, due in a large measure to the wise and sympathetic management of Mr. Cleeve and the local managers. They were creating a strong financial position. Mr. Binnie referred to the vexed question of excess profits duty and its application to new industries. New industries would be seriously handicapped. They must either work with inadequate working capital or be considerably over-capitalised by comparison with older industries. In view of the embargo on new capital, many of them might be driven to borrowing. A duty of 50 per cent., or even 60 per cent., was tolerable, but 80 per cent. stifled new industries and penalised thrifty management. The increase was a serious mistake. Although their company was not at present seriously affected by the excess profits legislation it was desirable that directors of new industries should take every opportunity of stating their case, and he hoped that discrimination might be exercised in applying new and untried legislation to our new industries.

The A.E.G.—The prospectus has just been published in Berlin in connection with the admission to quotation on the Berlin Stock Exchange of new shares of the nominal value of £1,450,000, which were decided to be issued in December, 1915, so as to permit of an interchange of shares with the company's subsidiary, the Berlin Electricity Works Co. Since then (July, 1917), a further emission of nominally £800,000 has been made by the A.E.G., and been taken over by the same company, which in exchange transferred shares in the Electro Works Co. to the A.E.G., which, in turn, as previously reported, has assigned these and other interests in the Electro Works Co. to the Imperial Government. At present the share capital of the A.E.G. stands at £10,000,000, the reserve funds are stated to amount to £4,650,000, and the loans of the 4, 4½, and 5 per cent. types which are still unredeemed total £5,300,000. The investment portfolio is represented by £2,819,000, and includes £980,000 in war loans and Government bonds, £265,000 in shares of branch companies, £625,000 in shares in A.E.G. sale companies, £477,000 in book value of 14,510,000 fcs. of shares in the Zurich Bank for Electrical Undertakings, and £362,000 in shares of the Felten & Guilleaume Co. The number of workers employed by the A.E.G. on July 1st, 1917, is stated to have been 79,293.

North Metropolitan Electric Power Supply Co.—An extraordinary general meeting of this company was held last week, when, according to the *Morning Post*, a resolution was passed to the effect that the amount which the company were autho-

risied to borrow on debenture or mortgage of the undertaking, a sum not exceeding the nominal amount (inclusive of bonus) of £13,333 be raised by the issue at such price, and to such persons, as the directors might determine of further mortgages in the like form and on the like terms and conditions as, and ranking *pari passu* with, the existing mortgages. Mr. E. GARCKE, who presided, explained that the object of the resolution was to enable the directors to provide security to be deposited with the Treasury in respect of loans obtained with the concurrence of the Ministry of Munitions for the purpose of carrying out extensions of cables and for other works to enable supplies of energy to be given for munition manufactures and other war purposes. The resolution was carried.

Claud Hamilton, Ltd.—The report for the year ended April 30th last states that the balance at credit of profit and loss account, after writing off the usual depreciation, is £10,669. Deducting from this the preference dividend, there is left for disposal a balance of £9,919. The directors recommend a dividend of 7½ per cent. and a bonus of 2½ per cent., less tax, on the ordinary shares; writing down investments, £500; placing to credit of a dividend equalisation account £2,000; and carrying forward the balance of £5,169.—*Financial Times*.

Stock Exchange Notice.—Application has been made to the Committee to allow the following to be quoted in the official list:—

Dick, Kerr & Co., Ltd.—Further issue of 40,000 ordinary shares of £1 each, fully paid, Nos. 260,001 to 300,000; and 45,000 six per cent. cumulative preference shares of £1 each, fully paid, Nos. 305,001 to 350,000.

Anglo-American Telegraph Co., Ltd.—Interim dividend for the quarter ended September 30th, 15s. per cent. on the ordinary stock, and £1 10s. per cent. on the preferred stock, less income-tax.

West India & Panama Telegraph Co., Ltd.—Interim dividends for half-year ended June, 1917:—6s. on the first and second preference shares, 6d. per share on the ordinary, free of tax.

Western Telegraph Co., Ltd.—Dividend, 3s. per share, and a bonus of 4s. per share, both free of tax, making the total for the year ended at June, 1917, 8 per cent.

Babcock & Wilcox, Ltd.—Interim dividend, 6 per cent.

STOCKS AND SHARES.

TUESDAY EVENING.

THE strength which has prevailed amongst gilt-edged stocks gives no indication of abatement, and the inauguration of another thrift campaign will have the effect of giving a fillip to the issue of National War Bonds. This has an effect upon other gilt-edged stocks, and the Consol market is good throughout, reflecting firmness on such issues as industrial debenture stocks, and the best class preference shares. The discussion that has arisen with regard to the possibility of a levy on capital is not affecting Stock Exchange markets in any way, but the prospects which are opened in this direction are arousing a good deal of attention. They make, at any rate, an interesting, not to say poignant, subject for consideration.

The home railway market is but fairly well maintained. Once more the amount of public support necessary to keep things going in this section has dwindled away, and business is of a very irregular order. The Undergrounds, however, keep tolerably steady, and the advertisement which they received through moonlight nights is regarded as a somewhat grim bull point for the stocks. Underground Electric Income bonds are maintained at 84, but Metropolitan shed ¼ and Districts declined to 16. There is not much doing in the other stocks.

Activity in Marconi shares is wavering a little. One day there will be a very animated market, while on the next, business falls away to a shadow. Attention centres a good deal upon the American Marconi shares, possibly because there is more speculation in these; possibly because those who follow the market seem to think there is wider scope for capital appreciation here than there is in the other Marconi shares. The parent Marconis are 1/16 lower at 3 7/16. Americans rose to 23s. 3d., but came back again to 22s. 9d. Canadians are 11s. 9d., and Marines, which have a useful investment following, are a good spot at 2 21/32, both old and new shares. There has been a little interest taken just lately in shares of the Spanish Marconi Co., the price being about 11s. 6d.

The appetite for cable stocks is keen as ever. Easterns, Westerns, Eastern Extensions, and Globes are the four popular investments, this, of course, being due to the fact that the dividends on the quartette are paid free of income-tax. Prices are better, and once again it has to be remarked that stock is a good deal more easy to place than it is to buy. The recent reports are excellent, and have given reassurance to those who were inclined to apprehend a possible deduction of income-tax from dividend payments. At present, anyway, there seems to be little fear of such an alteration being made.

South Londons are 5s. better at 3; Bromptons reacted $\frac{1}{2}$ to 6 $\frac{1}{2}$. These are the only changes amongst the Home electricity shares, where the list as a whole keeps very hard. General Electric ordinary have risen to 18. British Westinghouse preference eased off to 2 15/16. Recent buyers of these shares are wanting to take their profits in the absence of any further developments—even rumour being quiet—in connection with the American interests that were recently credited with intentions to bring about some kind of working arrangement between the manufacturers in this and their own country. Edison Swan shares, however, are better. The fully-paid have gained 5s. at £2; the £3 shares rose to 21s., though at the moment they are obtainable at this price. The company's 1 per cent. debenture stock is a point up.

In the colonial and foreign group, Kalgoolie preference have hardened to 5s. 3d., but Kalgoolie Tramways debenture at 12 $\frac{1}{2}$ is lower, the price being still more or less nominal. One feature of the last few days is a persistent demand for Manila Electric Railway capital stock, on which the price has risen 4 to 70. Anglo-Argentine Trams First preference receded to 3, and Brazil Traction remain depressed at 45. The Mexican stocks are also dull and heavy, small falls occurring in the bonds of the Tramways Co. British Columbia 4 $\frac{1}{2}$ per cent. debenture at 51 shows a slight recovery.

Rubber shares are steady and command a good deal of support. There is a further advance amongst copper issues. The armament shares have been inactive, but iron and steel descriptions keep on rising. On the whole, the Stock Exchange gets a good deal of business these days, in spite of air raids and other impediments.

Supplies for German Central Stations.—According to E.T.Z., the amount of copper allowed quarterly by the German Metal Controller for the purpose of maintenance and repairs in electricity undertakings is at present from 2 to 3 kg. (4 $\frac{1}{2}$ to 6 $\frac{1}{2}$ lb.) per 100 kw. installed. The allowance to stations which serve only lighting networks is subject to special control. All metal thus released must be replaced by old metal or, if there is a loss in the repair job, this must be made good by metal taken from some source not already requisitioned. The central station may not claim in respect of repairs, &c., to be made in consumers' works; the latter must make their own claim. Iron and steel supplies are subject to strict control, but iron parts held in stock by central stations for running repairs and the like, may be used without a special permit. Electricity stations stand third on the "urgency list" prepared by the military authorities for the control and disposal of railway trucks. The first three items on the list are: (1) Coal, coke and briquettes. (2) Timber of every description, wood carbonisation products. (3) Constructional and working materials, tools and machinery for mines, gas and electricity works. Electricity stations have had to put up with inferior or unsuitable coal supplies and they will remain under this disadvantage. In order that they may keep their boilers in good order and obtain full rated output from them, it is recommended that they adopt forced draught, cooled grates and coal breakers. These improvements should be made forthwith in order that they may be completely available for future peak-load periods. The Electricity Administration (Elektrizitätswirtschaftsstelle) is willing to do everything in its power to assist in rapid delivery and installation of the equipment concerned.

Charge of Stealing Lamps.—According to the *Daily Chronicle*, a charge of stealing 868,000 electric bulbs, valued at £1,800, was brought at the Guildhall on Saturday against Simon Deitch, a Spitalfields electrical engineer. Accused's explanation was that he bought the lamps, but in a box under his bed the police found 5,300 bulbs, which bore the initials of the prosecutor's factory. A remand was ordered, bail in £200 being allowed.

First Aid in Factories.—The order of the Home Secretary in regard to ambulance and first aid arrangements at blast furnaces, copper mills, iron mills, foundries and metal works, comes into force on December 1st, and copies may be purchased at H.M. Stationery Office.

THE HIGH-TENSION MAGNETO.

(Continued from page 382.)

THE INSTALLATION AND CARE OF A MAGNETO.

1. *Installation.*—Satisfactory operation of a magneto can only result if the alignment between the driving shaft and the magneto shaft be perfect. It is necessary to drive the magneto through some form of flexible coupling, and in a coupling that is used very extensively on aeroplane engines the drive is transmitted through a steel leaf spring having a total cross-section of 11 mm. \times 15 mm. Provision is made for obtaining an angular adjustment of the part which grips the leaf spring, with respect to the part secured to the magneto spindle, for the purpose of timing.

This particular design of coupling is not ideal, because whilst being sufficiently flexible in a plane at right angles to the axis of rotation, to take care of rapid and cyclic variations in the driving torque, it does not allow for the alignment of the two shafts being slightly in error. Obviously, any error of this nature will bring into play large stresses which may eventually cause the magneto to function imperfectly. A large percentage of the troubles that have arisen in practice with aeroplane magnetos have been due to imperfect alignment.

The magneto manufacturer is very careful in machining the base to ensure that the distance between the bottom of the base and the axis of the spindle conforms with extremely fine limits of accuracy. For example, this distance in the type A.S.S. magneto is nominally 50 mm., the limits being plus 0 mm. and minus 0.05 mm., giving a tolerance of 0.05 mm.

The author doubts whether engine builders are working to such fine limits as these in milling the platform to which the magneto is secured, and, in fact, it is a very difficult matter for them to do so. Some improvement is therefore to be looked for in the direction of devising some method of fixing that will simplify the machining problem. The use of a curved base plate on the magneto is a possible solution, because this enables the engine builder to machine the surfaces requiring alignment at a single boring operation, instead of having to perform two distinct boring and milling operations.

The curved form of base is used by the S.E.V. Co., of Paris, on one of their rotating armature type six-cylinder magnetos. With this arrangement dowel pins are used in the base for location purposes, the magneto itself being secured by some form of clamping device. This would seem to be an eminently sound arrangement.

Even when fixing screws are used in the base, it is customary to employ a strap which completely embraces the magnets. These straps are usually made of steel, and tests carried out on a type A.S.S. magneto have shown that the shunting of the magnet flux resulting therefrom amounts to about 6 per cent. This means approximately a 12 per cent. loss in the energy output of the magneto—an amount not to be overlooked. It is, therefore, recommended that the straps be made of phosphor bronze, and steps are now being taken to make this change.

2. *Timing.*—It is, of course, essential that when installing a magneto the adjustment of the coupling should be carefully made to give what is termed the correct "timing." In other words, when the contacts are just on the point of separating—as determined by the indication of a battery and bell connected in parallel with them—the relation of the driving shaft to the magneto shaft must be such that the piston in the cylinder to be fired is some definite distance from the top of its stroke. When the magneto is provided with variable ignition, this adjustment is made with the timing lever fully advanced. Usually, an aeroplane magneto is timed so that each cylinder is fired when the crank is about 30 deg. behind the dead-centre position.

In the type A.S.S. magneto the operation of timing is facilitated by the introduction of locking holes in the distributor brush gear wheel and distributor end plate, so that a pin inserted in the gear wheel can lock the sleeve inductor in the correct position. The pin can only be inserted after the distributor is removed, and likewise the pin must be withdrawn before the distributor can be replaced. This ensures that the magneto is not run with the locking pin inadvertently left in place.

3. *Setting of Distributor Brush.*—When the contacts are on the point of separating and the high-tension discharge is about to begin, the carbon brush (or metal brush in the type A.S.S. magneto) should overlap the distributor segment to the extent of about two-thirds of its contact surface. In the rotating armature type magneto the desired relation between brush and segment can be easily achieved by altering the meshing of the distributor brush gear wheel with the full-speed wheel on the armature shaft. Generally speaking, the correct meshing is indicated by the magneto manufacturer, who spot-marks two teeth on the brush gear wheel and one tooth on the other wheel. When the armature is in some definite position the latter tooth should mesh between the two former teeth.

In the type A.S.S. magneto the relation of brush to segment can only be altered by displacing the brush holder mounting with respect to the gear wheel to which it is secured. A change in the meshing of the two gear wheels is not permissible.

4. *Care of Distributor and Brush.*—The distributor and brush are vital parts of any magneto, and in overhauling they should be subjected to very careful treatment. The brush track of the distributor should be kept clean and polished. Any appreciable carbon deposit can be removed by cleaning the track with a cloth soaked in petrol, but if the segments protrude even by the smallest amount, it is necessary to have the track machined. If the distributor is made of an entirely satisfactory insulating material, trouble of this nature will not be experienced, because there will be no tendency for the insulation to shrink away from the metal during the life of the distributor.

For the best results to be secured, it is necessary to use a very hard grade of carbon brush, which should be properly bedded and polished. The spring tension should not be excessive, and both brush and spring should be perfectly free to move in a radial direction. There should be no signs of binding in the brush holder. In certain quarters a carbon brush having a highly-polished contact face is looked upon with suspicion, and in consequence it is the practice to remove the polished surface by the careful application of a file! This is a most pernicious habit, and cannot be condemned too strongly.

Experience has shown that to secure freedom from what is called "tracking" of the distributor it is very necessary to use a carbon brush that will readily take a high polish. The polished skin on the face of the brush is a desirable thing, and, when working in conjunction with a distributor made of suitable material, and having a polished brush track, there is no likelihood of "tracking."

5. *Contact Breaker.*—The satisfactory operation of any magneto is to a very large extent dependent upon the platinum contact breaker points being correctly adjusted. In the type A.S.S. magneto the maximum gap between the contact points, which are made slightly convex, should be .012 in. In rotating armature type magnetos the gap usually worked to is .015 in., and, generally speaking, a magneto that has to operate at very high speeds—that is, one which has to give a large number of sparks per minute, as in the case of a 12-cylinder magneto—should work with a smaller gap than one that has not to perform such strenuous duties. Great care should be exercised to prevent oil getting on to the contacts, because this will set up sparking, in consequence of the large resistance interposed between the contact faces, and carbonisation of the oil will result, which will greatly interfere with the satisfactory running of the machine. The contacts should therefore be kept perfectly clean, and this can be readily done by using a fine emery cloth. A file should not be employed under any circumstances whatever.

6. *Lubrication.*—As it is standard practice to use ball bearings in every type of high-tension magneto, very little lubrication is necessary, and special attention should be given to this point by all those who are entrusted with the care of magnetos fitted to aeroplanes or used for other purposes. Over-lubrication is, in fact, more likely to produce injurious results than too little lubrication, because the oil wells are likely to become flooded, and oil will possibly find its way into the distributor and contact breaker housing. Taking the type A.S.S. magneto, for example, six drops of oil in each oil well every 12 hours of running will be quite sufficient.

THE PROBLEM OF ENGINE STARTING.

The starting characteristics of the petrol motor are inherently bad. With other prime movers, such as the steam engine or turbine, motion results as soon as steam is allowed to enter the machine, whilst the ordinary electric motor can be started by the simple closing of a switch.

There are, fundamentally, only three methods of starting a petrol motor, neither of which is ideal:—

(a) To rotate the crank shaft slowly by applying a driving torque, until the cylinders are filled with an explosive mixture and the magneto is running at a sufficiently high speed to ensure satisfactory ignition. The driving torque may be produced either by hand rotation or by driving the crank shaft through gearing with an electric motor fed from a battery.

(b) To introduce compressed air into the cylinders so that the necessary driving torque is transmitted to the crank shaft through the medium of the pistons and cylinders. Starting is then effected as under (a).

(c) To fill one particular cylinder with an explosive mixture by hand rotation, or in some other way, and, whilst the crank shaft is stationary, cause an igniting spark to occur in this cylinder, using for this specific purpose a hand-operated auxiliary magneto co-operating with the main magneto. The main magneto may itself be adapted for producing this spark, while stationary, if suitable auxiliary apparatus be provided.

Method (a), using an electric motor, is generally adopted in America at the present time for motor-cars. It is also employed very considerably in this country for the same purpose. The method is far from perfect, chiefly for the reason that the torque required to start the engine is enormous for the size of motor that is generally installed.

The consequence is that at the instant when the switch is closed, the momentary rush of current reaches an extraordinarily high value—about 200 amps. for a 12-volt battery—when considered in relation to the capacity of the battery that has to supply it. Such treatment means that the battery very rapidly wears out and becomes useless.

This method has been tried on aeroplanes, but with what success the author cannot say. Fundamentally, it does not seem to be a method particularly suited to the requirements of the case, unless by very special attention to the design of the electric motor it is possible to reduce the weight to an extremely small figure.

Method (b) has also been tried on aeroplanes, but here, again, possibly on account of the increased weight of the compressed-air bottles which have to be carried, the method does not seem to have come into general use.

Method (c) appears to have met with the greatest success, and it is the method generally used at the present time on aeroplanes. So that this method can be applied, it is necessary to slightly modify the distributor brush holder, by adding what is termed a "trailing point." This is merely a nickel point which is moulded in the insulator so that the angle between it and the axis of the distributor brush is something of the order of 30 deg. This point is connected to a brass ring on the front of the brush holder moulding, and an extra terminal on the distributor is connected to an additional carbon brush which is in contact with the ring.

The hand-starting magneto—which is a small rotating armature type machine driven through gearing by hand—is connected to the extra distributor terminal, so that when it is operated the trailing point is maintained at a high potential. This means that when the trailing point comes in close proximity to the trailing edge of the distributor segment current will flow from the point to the segment through the air, and thence to the electrodes of the spark plug in the cylinder that is filled with an explosive mixture.

Owing to the angular displacement between the trailing point and the main brush, the piston in the cylinder under consideration will always be near the dead-centre position when the conditions as previously described obtain. The piston should, therefore, receive a forward impulse when the spark occurs, and this should be followed by other impulses in proper sequence, until a speed is reached at which the ordinary magneto is capable of performing its proper functions.

The hand-starting magnetos that have been developed in this country differ from the standard Bosch machine in that no high-tension switch is provided for the purpose of breaking the connections to the main magneto so long as the starting magneto is being operated. It is true that the introduction of such a device complicates the wiring, because it means that the high-tension lead from the armature of the main magneto has to be brought to a distributor terminal on the starting magneto, and another lead run between some other terminal on this distributor to the rotating brush on the main magneto.

Against all this we have to consider that the use of a high-tension switch absolutely prevents the main magneto coming into action until the starting magneto is stopped. Without the high-tension switch the main magneto will come into action at extremely low speeds, so that to prevent backfires it is necessary to retard the ignition during the starting period. The other scheme eliminates this necessity, because with fixed ignition on the main magneto it should be possible to take the engine up to a sufficiently high speed with the hand starter to ensure that when the main magneto comes into operation the timing of the spark will not be too far advanced.

It is perhaps not out of place to refer to the method of starting adopted on the 200-h.p. Maybach engine fitted to German airships brought down in this country, as described in *The Autocar* for December 16th, 1916. This type of engine has six cylinders, two-point ignition being provided. Two Bosch Z.H.6 magnetos—a new type of rotating armature magneto evidently developed since the outbreak of war—one of which is fitted with a trailing point, are provided. The hand starter is coupled up to the magneto with trailing point in the ordinary way.

A special method is adopted for filling the cylinder with an explosive mixture. By means of a lever and cam shaft all the valve tappets, inlet and exhaust, are lifted off their cams. At the same time the lever actuates other levers which close the exhaust passage to the silencer, by partially rotating the water-cooled barrel valve in the exhaust manifold. The exhaust ports and the outlet in the exhaust manifold are thus put in communication with a secondary outlet pipe that leads to a large suction hand pump, by means of which gas is sucked into the cylinders from the two carburettors through all the inlet valves. When this has been done the lever arm previously referred to is returned to its normal position. This operation opens the exhaust outlet to the silencer in the normal running position and closes the pipe leading to the suction pump. The hand starter is finally turned and the engine begins to rotate.

It is interesting to note that the angle between the trailing point and the centre of the distributor brush on the Bosch Z.H.6 magneto is 42 deg. On the type A.S.S. magneto fitted with trailing point this angle is, as already stated, 30 deg.

(To be continued.)

BRITISH AND AMERICAN ELECTRICAL TRADE WITH AUSTRALIA.

A FORTNIGHT ago we published (ELEC. REV., p. 348), under the title "Supertax" on British Trade with Australia," a criticism offered by the *Australian Statesman* of the action of the Australian Customs Authorities in adding 10 per cent. to British machinery invoice figures. We have now received the following copy of a letter written to the *Melbourne Age* by Mr. R. F. BUTLER, the local secretary of the B.E.A.M.A., which, in view of its interest, we quote in full:—

"The Senate last evening (August 10th) passed a resolution for the appointment of an official representative in Washington. The debate indicates that the function of this official representative will be to increase Australian trade with America, and recent cablegrams show that the appointment will be welcomed by the United States Government. The cordiality with which the proposed appointment has been received in the United States conveys the impression that the United States see, in the appointment, a possibility of increasing very materially its trade with Australia. It would be interesting to know whether the idea of making this appointment originated in Australia or in the minds of American representatives, either in the United States or in Australia. Anyone who has followed the development of this matter up to date cannot get away from the impression that its ready approval by the United States trade authorities is inspired by the idea that through this channel the trade of the United States with this country will be materially increased. We can hardly think that a producing country like the United States is hankering after the products of Australia to such an extent that it would invite or, at any rate, receive so warmly the appointment of an Australian representative merely for the purpose of promoting the exportation of Australian products to America, but rather that a country producing much the same commodities as Australia is animated more by the desire to use such a special representative as a means of increasing its export trade to Australia.

"For a considerable time this country has been courted in trade matters by America, who, naturally, has been taking advantage of the difficulties which British trade has experienced, due to war conditions, to extend her export trade to Australia. Australia appears now to be on the point of yielding to American persuasion, forgetting, apparently, the enormous debt she owes to Great Britain for her security and existence as a nation and for support in the whole of her financial transactions.

"In the business of exporting goods to Australia, America is a direct competitor of the United Kingdom, and in spite of our obligations to the mother country the Commonwealth Department of Trade and Customs has for some considerable time been increasing Great Britain's difficulties in carrying on her export trade with this country by 'loading' British invoices. Taking advantage of the increase which has taken place in the cost of manufacturing in Great Britain, particularly in dynamo-electric machinery, the Customs authorities have issued a ruling that all invoices for dynamo-electric machinery imported from the United Kingdom shall be loaded 10 per cent., with a net result that British manufacturers have to face a 10 per cent. increase in the duty which they have to pay, and which, in some cases, notably metal-filament lamps, is not imposed on, at least, one neutral country.

"The Customs Department may have legal justification, in view of the wording of the Customs Act, for loading invoices covering the importation of material which was contracted for before the war, but, at the present moment, if a British firm received an order for dynamo-electric machinery the invoice value is, for duty purposes, increased 10 per cent. by the Customs Department, notwithstanding the fact that such an invoice carries on the face of it the declaration required by the Customs as to its fair value, and independent altogether of any inquiries as to whether or not the particular invoice gives the fair market value in Great Britain. In this particular way the present administration of the Customs Act defeats the declared intention of this country to give preference to British material. To quote one instance: A 50-c.v. lamp imported from Holland pays in round figures 2½d. duty, while a similar lamp imported from Great Britain pays 5d. duty. It would be interesting to ascertain from the Customs Department whether, for example, they have in Holland at the present moment officers to ascertain what is a fair selling value of lamps in Holland, or whether they have officers in Sweden to ascertain the fair selling value of electrical material manufactured in Sweden and exported to this country.

"The whole attitude of the Customs Department, and the recent developments with regard to the appointment of a special representative in the United States, leaves a somewhat unpleasant impression in the minds of British manufacturers that Australia cares nothing for the success of British trade with this country, and that her attitude is not only indifferent, but is actually antagonistic to the support of British industry.

"Is it too much to ask that, while Australia enjoys its security, and while Great Britain is absorbed in the present European struggle with all her energy, Australia should not only support British trade in materials which cannot at present be manufactured in Australia, but should refrain from imposing additional burdens on the already hard-pressed

British manufacturer, and should also refrain from taking steps which will make it more difficult after the war for Great Britain to regain that portion of Australian trade to which, in common gratitude, she is entitled?"

The *Melbourne Age* makes the following comment on the matter:—

"Some light was thrown in the House of Representatives on the practice of the Customs Department in 'loading' invoices of dynamo-electric machinery imported into Australia from the United Kingdom. The Minister of Customs, in reply to Mr. Kelly (N.S.W.), said invoices were loaded by varying percentages, which were dependent upon the extent of the difference between the export price charged to the Australian importer and the home-consumption price charged to British buyers, which was the statutory basis of duty. This was done because it was found that manufacturers allowed buyers for export lower prices than were given to buyers for home consumption. These loadings had been imposed upon the invoice values of certain British firms, as far back as 1905, but the loadings now in force had, for the most part, been imposed since 1915. A similar practice had been followed in respect to certain American firms since 1907. The invoice values of metal-filament lamps from the United Kingdom were 'loaded,' but not of similar goods from Holland, because the prices charged for export by the Dutch manufacturer were the same as were charged for home consumption. Dutch lamps were accompanied by a certificate of origin, issued by the British Consul-General."

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

B.T.H. Oil-break Switches.

THE BRITISH THOMSON-HOUSTON CO., of Rugby, has recently issued two new lists, Nos. 4153 and 4155, dealing with oil-break switches, types O, form C, and O, form E, respectively. The former type, illustrated in fig. 1, is suitable for circuits up to 300 amps.

FIG. 2.—B.T.H. OIL-BREAK SWITCH, FORM E.

at 3,300 volts, while the latter type (see fig. 2) is designed for use on heavy A.C. circuits up to 650 volts with ratings of 2,000 and 3,500 amps. at 50 cycles or less.

In the former type, standard switches can be supplied in single, double or triple-pole non-automatic and automatic patterns suitable for switchboard mounting, also in single-pole automatic patterns for wall mounting.

These switches are of the free-handle type, and open by gravity when the tripping device operates; the switch motion is accelerated by the aid of springs, and a double break is obtained.

The oil vessel, trip coils, and operating mechanism are supported by a common frame; the switches can be provided with overload and low-voltage release, and in connection with the former a time-lag device of the oil dash-pot type can be supplied.

The form E switch is of heavier construction; the oil-tank contacts and operating mechanism are mounted on an impregnated

FIG. 1.—B.T.H. OIL-BREAK SWITCH, FORM C.

slate base, as shown in fig. 2; contact is made by laminated brushes bearing on solid copper blocks, and the brushes have renewable sparking contacts for the protection of the main contacts. Various combinations of trip coils can be provided, and in such cases B.T.H. time-limit fuses are fitted, giving a wide range of adjustment for time and current. The switch-operating mechanism is of the free-handle type, and auxiliary indicating circuits fitted with bell or lamp can be installed.

Screwdriver Attachment for Cutting Pliers.

Since pliers and screwdrivers are the tools most frequently used by the electrician, they should be in such a form that they can be easily carried around. Pliers with a screwdriver forged at the end of one of the handles are common, but the screwdriver is unhandy and is seldom used.

After considerable experimenting, the screwdriver attachment shown in the illustrations was developed and has proved very useful.

FIGS. 3. AND 4.—SCREWDRIVER ATTACHMENT FOR PLIERS.

In fig. 3, A is made of tool-steel and hardened. The jaws B are bent from $\frac{1}{8}$ -in. soft sheet iron and held together by the two straps C, and rivets D. Dimensions cannot be given, as curves and shapes change in accordance with the shape of the pliers used. The form is obtained by bending the sheet iron round the pliers and riveting it to the tool-steel blade A. The device is so small that it can be easily carried in the vest pocket. Fig. 4 shows the screwdriver attachment in place ready for use.—M. P. BERTRAND, in *Power*.

Drawn-wire Lamps in Austria.—The patent dispute concerning the rights in drawn-tungsten filaments is reported to have been settled in Austria, where the Patent Office has decided in favour of the A.E.G. and its allied companies in this particular matter.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

RUSSIA.—A Decree of the Provisional Government was promulgated on August 23rd putting into force the Decree prohibiting the importation of all goods except under licence—see the ELECTRICAL REVIEW for September 21st. The prohibition is stated to be applicable to imports by sea (all frontiers), *via* the Russo-Finnish frontier, *via* the station of Manchuria on the Asiatic frontier, and covers both ordinary shipments and goods sent by parcel post. In view, however, of the fact that it is practically impossible to send goods to Russia except by arrangement with the Commission Internationale de Ravitaillement, the above-mentioned prohibition is of little real interest to shippers. Goods shipped under permit issued by the Commission require no further licence.

SWITZERLAND.—A Federal Decree has been issued consolidating and extending the Swiss prohibitions of export. The effect of the measure is to prohibit the export of goods of all kinds with the exception of a specified list, which includes china insulators and electric lamps. Dynamo-electric machines, electrical transformers, induction coils, and high-tension coils for dynamos are among the prohibited goods.

TUNIS.—A Decree, dated July 31st, has been promulgated which imposes on the importation of goods into Tunis restrictions similar to those imposed in France by the Decree of July 8th—see the ELECTRICAL REVIEW of October 5th.

MEXICO.—The retirement of the paper pesos, known as *infalsificables*, by means of a surtax on imports and exports, and on the production taxes on petroleum and metals, has been decreed. As from April 1st last, all import and export duties, and also the stamp tax on metals, &c., were to be subject to a surcharge of one dollar *infalsificable* paper for each gold dollar or fraction thereof of the amount payable.

COSTA RICA.—A Decree has been issued by Congress establishing export duties, payable in American gold, on certain articles, including manganese ore, the duty on which is fixed at 6 per cent. *ad val.*, and rubber, the duty on which is 10 per cent. *ad val.* These export taxes are to be paid in bills of exchange drawn on the place to which the goods are destined.

REPUBLIC OF COLOMBIA.—Certain modifications of the import Tariff of the Republic have been made by a recent Law. Steam or electric motors and accessories, iron or steel towers, steel cables, rails, and accessories of iron—all for aerial lines—are now admitted free of duty. Gauze or netting of copper wire is now dutiable at the rate of 6 cents (about 3d.) per kilogram.

CHILE.—As from April 12th, export duties are now payable as follows:—60 per cent. in notes, with the corresponding surcharge, as noted in the ELECTRICAL REVIEW of August 24th; 30 per cent. in drafts on London at 90 days' sight, the amount in drafts to be paid for each gold peso to be determined according to the average exchange value of drafts—to be ascertained weekly; and the remaining 10 per cent. in national gold coin.

ECUADOR.—A recent Presidential Decree provides that samples having a commercial value, introduced by commercial travellers, are granted temporary duty-free admission, under bond for re-exportation within 120 days. A slight modification has also been made in the conditions under which duty-free admission is accorded to commercial advertising matter in the form of sheets, pamphlets, or cards, and objects which are not and do not contain articles for sale. These must now bear an inscription, in letters of a size not less than half a centimetre, that the articles are intended for gratuitous distribution ("*que estan destinados para obsequios*").

ARGENTINE REPUBLIC.—The Argentine Budget Bill for 1918, which has recently been submitted to Congress, contains a clause which provides that the tariff valuations shall be increased by 10 per cent. in respect of goods which, under the Customs Laws, have to pay duty on their weight plus that of the immediate wrappings and packings, in cases where such goods are imported into the Republic without such internal wrappings and packings.

It is also proposed that, from September 1st, 1917, to the end of the year 1918, all goods exported from the Republic shall pay an export duty at the rate of 2 per cent. *ad val.*, except certain articles which are to pay specific duties. Products the export of which can only be effected under licence are to pay a tax of 20 per cent. *ad val.* The export duties are to be payable in gold currency.

Electric Steel in Italy.—The Società delle Ferriere di S. Giovanni Valdarno inaugurated, on August 7th, the first of the Siemens-Martin furnaces which it has decided to lay down to complete its projected equipment and to assist in developing its lignite mines. The new steel furnace will work with electrical energy supplied by the company's own works, which utilise lignite as fuel.

THE TRAINING OF ENGINEERS.

ELSEWHERE in this issue we report the meeting which was held at the Institution of Civil Engineers last week, to form a "Central Organisation for improvement in and better co-ordination of Engineering Training." In this we see the culmination of a movement which has been in progress for many years, which has been accelerated by the lessons of the war, and which owes its successful issue very largely to the disinterested and indefatigable efforts of Mr. A. E. Berriman and Mr. A. P. M. Fleming, to whom the hearty thanks of the engineering world are due. The meeting was unanimously in favour of the proposition which it had been summoned to discuss, but which, by a curious departure from customary procedure, was not placed before it in the form of a resolution until most of the speakers had expressed their views. The adoption of the resolution without a dissentient voice was a foregone conclusion, and the scheme was launched with universal approbation.

The objects of the new Central Organisation can hardly fail to appeal to everyone who is interested in the welfare of the nation in general, and of the engineering industry in particular; the latter is essential to the former, and permeates the whole of our national life to an extent which can scarcely be realised by anyone who is not himself an engineer. Upon the maintenance of our position as an engineering nation depends our economic future in the coming industrial conflict, and it is of the utmost importance that every effort shall be made immediately to remedy the deficiencies in our methods of training engineers and securing the development of brains and talent in all ranks. We are glad to note, therefore, that the promoters of the scheme are fully alive to the necessity of providing for the adequate training not only of the engineer properly so-called, but also of the rank and file of the industry, whose functions are of equal importance to the State.

In point of fact, we doubt very much whether the facilities already provided in this country for the training of the engineer are greatly in need of improvement in themselves; many of our colleges are admirably equipped and staffed—the only respect in which they are deficient is in cheapness. Unless a youth can win a handsome scholarship, of which the supply is meagre, he cannot hope to follow the recognised curriculum and obtain a degree in engineering without imposing on his parents or guardians an expenditure which is prohibitive to all but the well-to-do. This is a grave defect in our educational system. No one would support the absurd contention that talent is confined to the progeny of the wealthier classes, and it stands to reason that many a boy of inherent engineering ability, or even genius, is either compelled to seek some other vocation less costly to enter, or, following his natural bent, is handicapped throughout his career for want of the training that his gifts deserve, and is unjustly condemned to a lifelong struggle to fulfil his true destiny.

A careful study of the three main objects of the scheme will show that, in fact, this fundamental principle underlies them all—help those who are worthy to help themselves. It is definitely crystallised in the third paragraph, which states what, in our opinion, is the most pressing need of all. We were exceedingly pleased, therefore, that Mr. Acland was able to state that, in spite of the post-

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: "AOEEKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 8d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

ponement of the Education Bill to the distant future, his successor at the Board of Education would shortly bring in as a measure of urgency a Bill to authorise the allocation of over £300,000 a year to this important purpose.

It will be recalled that so long ago as July last year the Consultative Committee on Scholarships for Higher Education, of which Mr. Acland was Chairman, in an interim report recommended that the Government should give grants in aid amounting to nearly £340,000 a year for the strengthening of the higher parts of secondary schools, for maintenance grants to scholars to enable them to receive higher secondary education from 16 to 18 or 19, and for scholarships to universities in scientific and technical subjects and research. The forthcoming Bill, no doubt, embodies these suggestions, and we trust that the Government will take care to smooth its path through Parliament, for the matter is too urgent to permit of further delay. While it is true that the sums referred to are not restricted purely to engineering, we have no doubt that a very large proportion will be allocated to that supremely important industry, and will go a long way (though still very far short of our true needs) towards meeting the third aim of the Central Organisation.

While we have dealt mainly with this item, we are in cordial agreement with the whole of the programme outlined, and we join with Mr. Acland and other speakers in welcoming the proposal to form an Information Bureau to which, like them, we shall be able to forward the inquiries which we are constantly receiving from "the perplexed parent whose son is approaching the completion of his last term at school."

**Government
"Control"
of Trade in
War Time.**

THE trade control methods that have been employed by the Government through its innumerable Departmental Officials during the war formed the subject of a very large and unanimous gathering held at Cannon Street Hotel on Thursday last week. Speaker after speaker insisted that they did not, of course, object to the principle of Government control in a time of such serious national emergency as is now upon us, but one and all of them did protest most strongly against the unbusinesslike way in which many of the restrictions have been imposed, and the incompetence and ignorance that have been displayed in carrying these restrictions into effect. Sugar, tea, leather, hay, dried fruits, metals, and paper were all in turn drawn upon by their respective experts or exponents to show how muddle has been caused in regard to each and all of them, and why? In the main because the Government has not seen fit to avail itself of the experience of the merchants and traders of this and other great cities in the country who have built up great business connections in all parts of the world because of their lengthy specialised and most intimate acquaintance with these particular commodities, and the procedure attending their purchase and import for home consumption. It was complained that in very few trades had the Government consulted the trades themselves in connection with such matters. Happily, the electrical trade was mentioned as one in which the exception had been made, but the feeling displayed by the representatives of the metal trades, which are the nearest allied section to the electrical, was very strong indeed. The arguments used do not, save in respect of this section, materially concern us as an electrical journal, but they certainly do appeal to us from the point of view of Governmental control generally. Our own pages have shown from time to time that even in the favoured electrical trades all has not been well when the Government hand has come down upon them, but in respect of commodities

which came more directly in evidence at the meeting there was a procession of examples of colossal ignorance which had been shown, and blunders perpetrated, by officials who possessed no qualifications based on experience of the particular trade which they as Civil Servants, permanent or temporary, had "authority" to "control." The point needs no labouring. Under such conditions as obtain at present, control there must be, and it is for the Government to see that while it must last, in the interests of ourselves and our Allies, such control is imposed with efficiency and fairness, and by men who *know*, not by clerks who have to learn their business by groping their way through a forest of mistakes while incoming supplies are badly regulated, both as to quantity and as to port of discharge. Of course, there is another side to the matter. Tonnage accommodation, the need for independence and freedom from suspicion on the part of officials, and so forth, are factors of overwhelming importance. What seemed to enrage the merchants at Cannon Street Hotel more than anything else was the tendency shown by the Government to eliminate the merchant. They protest that they have done more than anybody else to build up our vast foreign trade, and that often they have to give credit and so produce business where the manufacturer will not give it. That the merchant has had in the past a large place to fill in our economic machinery, and that he will continue to do so, goes without saying, but the manufacturer of machinery for export markets has had to complain that the merchant at his foreign branches has not always helped British industry, but has far too often sent business to present enemy countries. The Government Commercial Intelligence representatives went to Birmingham and urged the brassmakers to combine or they would go under. Sir W. Ashley has also been to Birmingham on a similar mission. The merchants consider that the Government has thus exceeded its authority. Combinations of manufacturers dealing direct with foreign and Colonial markets through competent technical salesmanship might have little use for merchant assistance. The subject is a very large one, with many aspects, and it affects manufacturing industry as well as commerce. The merchants of the United Kingdom are preparing to make their voice heard unitedly in defence of their own interests. Their businesses in many cases are suffering owing to the hardness of the times, and they naturally resent being described as "parasites," but, while we have no sympathy with those who so describe them, we cannot dispose of so vast a question by means of a series of resolutions of protest forwarded to the Government. Furthermore, the protest can hardly help in the efficient conduct of the war when the Government is involved in such great difficulties every hour of the day. The control organisation is undoubtedly imperfect, and if it can be satisfactorily improved upon by enlisting the services of representatives elected by the trades affected the Government should repair the deficiency. But control itself cannot be lessened in such times as we are living in. The Cannon Street meeting was one of protest by men whose personal business interests have been affected, yet who must appreciate the manifest intention on the part of the Government to secure the safety of shipping and the sufficiency of food and raw material supplies, and to strengthen the spirit of unity among the people. Being a protest meeting, of course, one could not hear the other side. The Government case, if it could have been stated in reply, might have done something to temper the storm. The meeting decided to ask the Government to declare what its policy toward the merchant is going to be. We have our doubts whether our statesmen are yet prepared to define that policy in detail. So much depends upon so many things.

MESSRS. FULLER'S CARBON WORKS.

In addition to their manufacture of primary and secondary batteries and insulated wires and cables, Messrs. John C. Fuller & Son, Ltd., decided to establish new works for the manufacture of arc lamp and battery carbons, and the carbon factory has now been at work for several months. It is controlled by a subsidiary company, and is designed to produce all kinds of carbons for batteries, arc lamps, kinematographs, welding, &c.

From previous descriptions of carbon works which we

FIG. 1.—GRINDING AND MIXING MACHINES.

have published, our readers will be aware that the industry is one which calls for a heavy outlay at the very start, owing to the necessity of laying down an elaborate and costly system of furnaces, and this feature no doubt has deterred many would-be manufacturers from incurring the risks attending an enterprise which cannot be inaugurated upon a modest scale—and which, moreover, before the war was subjected to intense competition by German and Austrian manufacturers. We are all the more pleased, therefore, to welcome the new undertaking as an additional guarantee of the establishment of the carbon industry in this country, and of our being self-contained in the future in respect of this most important industry, a "key" industry essential to the national safety.

The fundamentals of carbon manufacture may be briefly summarised as follows:—The raw materials usually consist of gas-retort carbon, soot, and tar. The carbon is carefully picked by hand to eliminate foreign material as far as possible; it is then crushed and ground to powder in ball or roller mills. The soot is specially manufactured by the incomplete combustion of oil, and the tar is of special quality. These three constituents are intimately mixed in steam-heated kneading machines and calenders, and the material is finally formed into cylindrical blocks for use in the hydraulic press. The latter extrudes the hot carbon mixture through dies shaped according to the desired product, and the rod or bar is cut into lengths of about 4 ft. as it comes from the press. These sticks become fairly stiff when cold, and are tied up in bundles, which are packed in fireclay crucibles with a filling of carbon dust to exclude air.

The furnace chambers are arranged in the form of a

flattened ring, with ducts supplying producer gas between them, and flues to carry away the waste gases round the outside; by means of movable pipes and water-sealed valves in the roof of the chambers, gas can be admitted at any point, and, after combustion, carried into the flues. In order to avoid loss of heat, the waste gases are conducted through a number of the chambers before discharging them to the flues, thus warming up the chambers and their contents. By shifting the points of entrance and exit at regular intervals, it will be seen, the hot zone is gradually moved round the circuit of furnaces, each time bringing one or more cold chambers into operation, and removing a corresponding number of chambers from the active zone at the rear. The baking operation occupies a period of about seven days. The air required for combustion is passed through the chambers containing carbons which have been baked and are cooling down, thus recovering a portion of the heat and assisting in the cooling process.

The baked carbons, which are hard and ring when struck, are next cut to the appropriate lengths by a chopper machine, sorted, and flattened at the ends with an emery wheel. Carbons for magazine flame lamps are usually left flat at both ends; for open arcs and the Excello flame type they are pointed at one end.

The accompanying illustrations show some of the plant.

As the building of carbon-baking furnaces does not exist as an industry, it was necessary for the company's own staff to design and erect them; naturally many difficulties were met with, but were all overcome in turn. Much of the machinery had also to be specially made to their own designs.

The processes may be regarded as commencing with the manufacture of lampblack. The heavy oil from which it is derived is burnt in a pan about 4 ft. in diameter, with a limited supply of air; the products of combustion pass through iron flues into a series of large brick chambers, in which the soot is deposited. Periodically the operation is stopped, the chambers are cleared of foul gases by means of a motor-driven fan, and the lampblack is collected.

FIG. 2.—MIXING AND CALENDERING MACHINES.

The company have a small paint works in operation, in which they utilise a part of the product of their lampblack plant, and doubtless this business will also be developed.

Figs. 1 and 2 show grinding, mixing, and calendaring machines in the mixing shop, which prepare the materials for the press. Here the carbon is crushed in an ordinary

stone-crusher to the size of a walnut, after which it is passed through an edge-runner, which grinds it to coarse powder. It is finally put through the "fine grinder," which reduces it to powder, and is then ready for mixing with the other constituents.

Fig. 3 is a view in the press-room, showing a large

FIG. 3.—CARBON PRESS.

hydraulic press which, like all the other apparatus, is driven by an electric motor. The press motor is of 20 h.p., and was made by Messrs. Mawdsley's; all the rest are E.C.C. motors.

Fig. 4 shows the interior of the furnace-room, with some of the baking chambers open. At the far end of this

While the demand for carbons for primary batteries, kinematographs, search-lights, and welding purposes, is certain to increase, it may be questioned whether the position of ordinary arc-lamp carbons is equally secure, in view of the growing popularity of the "half-watt" lamp. On this score, however, there need be no misgivings. While the

high-efficiency incandescent lamp is unrivalled for many purposes, especially for indoor lighting, the flame-arc lamp of the magazine type (to which we refer nowadays when we speak of the ordinary arc lamp) remains by far the most efficient, economical and effective illuminant where large areas are concerned. Yellow flame 10-ampere arcs, with clear globes, give an "efficiency" on the basis of the lower hemispherical candle-power of 0.152 watt per candle, when clean, falling to 0.268 w./c.p. after burning for 100 hours. On the basis of mean spherical candle-power, the figures are 0.292 to 0.5 w./c.p. According to Mr. Maurice Solomon, from whose I.E.E. paper in 1912 these data are taken, while the cost of renewals, attendance, and depreciation of metal-filament lamps per 1,000 m.s.c.p. per annum is less than that of flame arc lamps by £2 4s., the cost of energy at 1d. per unit is less than £7 for the arc lamps and more than £18 for the metal-filament lamps, leaving a balance in favour of the arc of about £10 per annum. At higher prices for energy,

the advantage of the arc lamp would be correspondingly increased. There is therefore no reason to suppose that the flame arc is approaching extinction.

For open and kinematograph arcs the positive carbon is cored. In this case the carbon rod is squirted from the press, with a hole in the centre, which is filled with the

FIG. 4.—INTERIOR OF FURNACE ROOM.

building is the producer house, where fuel gas is generated from small coal in a producer of the Dowson type. The tapping holes for connecting the gas duct with the chambers, and the chambers with the flues leading to the chimney, are visible in this view.

core material after the baking operation. For colourless arcs the filling consists mainly of alkaline silicates and finely-ground carbon powder; yellow arcs are produced with alkaline silicates, fluor spar, and carbon powder; for white flame arcs, cerium earth salts are substituted for

the fluor spar (calcium fluoride), and for red coloration strontium salts are used. In direct-current flame lamps, the flame material is usually inserted in the positive carbons only; for A.C. flame arcs both carbons are cored. Long carbons (over 15 in.) are fitted with a metal wire which passes down through the carbon to lower the resistance. This is a better plan than to copper-plate the carbons, which causes them to burn unsteadily. In the case of high-class kinematographs, the negative carbon is sometimes coppered, which enables it to be made of small diameter, and is provided with a solid core, 3 mm. in diameter, which produces a little pip on the end of the negative, and results in remarkably steady burning.

Although the factory has not yet been six months in operation, it is now being extended. We learnt with pleasure, also, on the occasion of our recent visit, that a canteen is about to be built for the comfort of the work-people, taking the place of the existing temporary arrangements. On every hand there was evidence of progress and abundance of work, and in thanking the firm for the courtesies extended to us, we may add the hope that both during and after the war its affairs will continue to prosper.

ELECTROSTATIC VOLTMETERS.

By C. H. WRIGHT.

As a standard and also a readily-applied connecting link between direct and alternating voltages, a good form of electrostatic voltmeter is, without doubt, the best for commercial test rooms.

A suspended reflecting instrument of this kind *permanently installed* in a laboratory or test room runs little risk of mechanical derangement by accident, especially if the excellent plan of fixing standards permanently to a wall is adopted, as is done in most well-equipped laboratories.

The instrument can be checked quickly against a potentiometer by direct-current pressures, and by employing high non-inductive resistances with suitable tappings for the application of the voltages to be measured (the instrument being applied across a definite fraction) the range of a low-voltage instrument can be extended as required, a suitable multiplier being employed. The value of this multiplier is determined by the ratio of the whole resistance in use to that part of it across which the actual instrument is applied.

A well-constructed multicellular electrostatic instrument, being unaffected by changes of frequency or wave form or by magnetic fields in the neighbourhood, is especially suitable for use in a commercial test room as a standard of reference against which to check the working testing instruments for alternating-current work.

It is important to see, however, that an instrument of this class is of the best design and construction if for use as a standard of reference. In this connection the following note may be of interest:—

Some years ago the writer had some tests made in which a reflecting electrostatic voltmeter of unknown make was used. These tests showed anomalies which were ultimately traced to the voltmeter. The instrument was fitted with 10 aluminium vanes, attached to the spindle by means of aluminium wire pins, and had been in use in an atmosphere somewhat bad for electrical instruments generally, for about 10 years.

On testing it against a potentiometer on D.C., it was found correct, the largest error being less than one-half of 1 per cent., yet, as compared with a well-made hot-wire voltmeter on an alternating circuit, it indicated consistently lower, and the discrepancy was found to increase with increase of frequency, being about 3 per cent. at 60 cycles and $6\frac{1}{2}$ per cent. at 100 cycles.

On D.C. both the electrostatic and the hot-wire instruments agreed with each other and with the potentiometer. The trouble was traced to the fact that two or three of the vanes of the electrostatic instrument were not in good contact with the stem to which the suspension was attached, and presumably owing to the high resistance between them and the stem, they required a definite time to become charged

as fully as the other vanes. The oxidation or corrosion of the very small aluminium pins was probably the cause of the trouble.

After efficient connection had been made between the affected vanes and the stem, the instrument became normal, and was correct on both D.C. and A.C. at all the frequencies available for testing at the time—namely, up to 130.

In the latest Kelvin low-tension electrostatic voltmeters the vanes are actually soldered to the stem, which is an excellent arrangement.

In electrostatic voltmeters for very low voltage it is desirable to have the fixed and movable elements of the same metal, as otherwise in calibrating with D.C. two sets of readings with reversed polarities are required, which involves extra labour, and is a precaution which may possibly be omitted on occasions.

This desirable feature is arranged for in low-voltage instruments by the best makers.

AMERICA'S EXPORT TRADE IN ELECTRICAL GOODS.

By MALCOLM CHALMERS.

THE ousting of German electrical goods from the world's markets and the restrictions which the war's demands have placed on British firms has been very beneficial to the electrical industry of the United States. It is not surprising, therefore, to learn that the year ended June 30th, 1917, the returns for which have recently come to hand, has been a record one so far as the exports of electrical goods are concerned, the value of such exports having reached nearly £11,000,000 in that year.

The following figures for the last four years show the progress that has been made since the war:—

Year ended June 30th, 1914	£5,312,000
Year ended June 30th, 1915	4,187,000
Year ended June 30th, 1916	6,399,000
Year ended June 30th, 1917	10,976,000

It will thus be seen that, as compared with the previous year, last year's figures show an increase of just over 70 per cent., whilst as compared with the last pre-war year the increase has been one of 105 per cent.

When we turn to the details we find that this increase has been fairly general, but that increases are especially noticeable in the case of batteries, wires and cables, metallic-filament lamps, electric motors, and telegraph and telephone instruments. On the other hand, exports of dynamos, transformers, and arc lamps were less last year than before the war.

In the subjoined statement details of the exports last year are shown in comparison with those for 1913-14, the last pre-war year:—

	1913-14.	1916-17.	Inc. or dec.
	£	£	£
Batteries	143,000	631,000	+ 438,000
Dynamos and generators ...	549,000	532,000	- 17,000
Fans	90,000	101,000	+ 11,000
Insulated wire and cables ...	415,000	1,498,000	+ 1,083,000
Interior wiring supplies (including fixtures) ...	150,000	234,000	+ 84,000
Lamps: Arc	16,000	3,000	- 13,000
Lamps: Incandescent:—			
Carbon-filament	36,000	33,000	- 3,000
Metallic-filament	46,000	416,000	+ 400,000
Meters or measuring instruments	*	216,000	+ 216,000
Electric motors	916,000	1,228,000	+ 252,000
Telegraph instruments (including wireless apparatus)	28,000	112,000	+ 84,000
Telephone instruments ...	324,000	407,000	+ 73,000
Transformers	303,000	263,000	- 40,000
Electric locomotives	91,000	110,000	+ 19,000
Other electrical goods ...	2,175,000	5,112,000	+ 2,937,000

* No information. The exports, however, in this year were probably quite small.

Of course, the increases shown above do not in all cases represent an increased volume of trade; some of it is doubtless due to inflated prices. After allowing for this factor, however, it must be admitted that the development has been phenomenal. Unfortunately, the returns do not show quantities, except for electric fans and lamps. In these cases, however, increases are shown in the actual quantities exported. Thus in the last pre-war year 32,816 fans were exported, valued at £2 15s. each; in 1915-16, 26,519, valued at £2 16s. each, were sent abroad, whilst last year the exports numbered 44,690, worth £2 5s. each. The exports of carbon-filament lamps in 1913-14 numbered 1,285,858, the average export value of which was about 7d. per lamp. In 1915-16 the number exported was 1,197,751, and the value about 6d. per lamp, whilst last year 1,341,444 of these lamps valued at less than 6d. each were exported. The increase in the case of metallic-filament lamps has been much more pronounced, as in 1913-14 only 849,261 lamps, valued at about 1s. 1d. each, were shipped abroad, whilst last year the number was 10,707,014, and the total value £446,000, *i.e.*, about 10d. per lamp.

Whilst on the subject of lamps, it is interesting to note that the United States does a large import trade in metallic-filament lamps, the figures for the last four years being as follows.—

1913-14	6,925,753	£114,154
1914-15	6,210,173	118,153
1915-16	4,863,060	146,208
1916-17	7,664,746	46,185

It will be seen that up to June, 1916, the imports were declining, but that prices were rising rapidly. Last year, however, the number imported increased by 50 per cent. over the previous year, whilst the total value was less than a third of the value in 1915-16. The figures are so peculiar that some explanation is necessary, though none is given in the American official returns. The most probable explanation is that whereas in earlier years the bulk of the imports consisted of ordinary lamps for house lighting, and came chiefly from the Netherlands, last year the great majority were miniature lamps for pocket flash-lights. It is known that Japan has been manufacturing this class of lamp in large quantities for the last year or so, and it is most likely that that country is the chief source of the lamps specified in the returns for 1916-17.

As regards the markets to which American electrical goods were shipped last year, no information is given in the returns, nor will they, in all probability, be available for some considerable time yet. From the record of past years, however, and an examination of the import returns of other countries, it appears that America does a world-wide trade in this class of goods, but that the principal markets at the present time are the United Kingdom, France, Italy, Canada, Australia, Central and South America, and Japan.

With regard to future possibilities, it would be useless to attempt a prediction. It may be that the American electrical industry will continue to improve its export position, but it must be remembered that in pre war times Germany's export trade in this line was about 10 millions sterling, and that of the United Kingdom about eight millions. At the present time, Germany can be doing hardly any export trade owing to the difficulty of obtaining copper and other necessary raw material, to war demands, and the stringency of the Allied blockade. The United Kingdom export trade has also decreased considerably, the exports last year being valued at only £9,000,000, in spite of increased prices. Once the war is over, however, both Germany and this country will be active competitors in the world's markets once again, and it will remain to be seen to what extent America will be able to maintain her present position as the leading export-

ing country in electrical goods. It must be remembered, too, that Japan has entered the field as a manufacturer of this class of goods (see *ELECTRICAL REVIEW*, August 10th, p. 124), and although it will probably be some years before she will be able to compete successfully in other markets against the United Kingdom, Germany, and the United States, she will probably be able to retain the home market, which has hitherto been a good one for imported electrical goods.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The E.T.U. or the A.E.S.E.?

In asking you to afford us space in which to reply to the A.E.S.E. campaign of misrepresentation, we would point out that it was the intention of the promoters of the station branches of the E.T.U. to abstain from any criticism of the A.E.S.E.: but as this Association has thought proper to attack the station engineers' branches by a misrepresentation of the facts of the situation, we feel sure you will allow us to put our position before your readers. Mr. Ebben and the members of his Association were invited to join our organisation with a view to a common programme; he replied: "I am seriously considering the whole position"; this was about six months ago, since which no further communication has been received. Was it expected that we should forego our progress until his Association had decided what they would do? Instead of working for the common good of the station engineers, they opened a public attack on those who were, and are, seriously attempting to improve the conditions obtaining in this branch of the industry.

1. They state that we do not represent station engineers, when, as a matter of fact, we represent every electrical power sub-station and mains electrical grade, including the supervising grades of power station charge engineers, sub-station superintendents, mains engineers, &c., employed by over 40 of the largest power and lighting authorities; in London alone our membership is just under 1,000.

2. They publish a list of concerns which they purport to represent.

Let us take two of the concerns mentioned—*viz.*, the L.C.C. and the North Metropolitan Electric Supply Co. Our membership on the L.C.C. is over 100; our membership on the North Metropolitan is over 50, and, moreover, we obtained the Engineering Award for our North Metropolitan members just recently.

3. In criticising our trade card, they state that the "A" card was not drawn up by technical men. "B" grades are mentioned, which do not exist, and grades which do exist are not included with reference to "A." This card was drawn up at a series of open meetings, attended by all station and mains grades, several of whom can write I.E.E. after their names; surely these would be counted as technical men.

With reference to "B," the grades not included are probably those mentioned by the A.E.S.E. appeal of October 19th; mains superintendent, mains assistant, meter superintendent, draughtsmen, testing engineer, installation inspector, commercial assistant, and publicity engineer. Apart from the fact that none of these designations are power station designations, they are really reiterations of the same, inasmuch as most of the supply authorities reduce at least five of these designations to one—*viz.*, mains assistant, who is invariably the utility man.

4. They state that we have set a flat rate for engineers. No such suggestion appears on our card; what is claimed is a uniform minimum rate, and it clearly states that where the conditions are better they are to be upheld.

5. They state that "We suspended action during the war"; probably, but they did not fail to attempt to take full advantage of the Trade Protection Certificates, "Engineering War Awards," obtained as the outcome of action by us in conjunction with the other Engineering Unions.

We did not suspend action during the war, with the result that the attempt to patriotically (?) exploit wounded soldiers and sailors by engaging them for sub-station work at 25s. per week was stopped by our representatives on the National War Pensions Dilution Committee, who also established the precedent that, while not offering any objection to any soldier or sailor going into a sub-station, on no account was a pension to be regarded as part payment of wages. The justice of this claim was recognised by the Government; and, moreover, we have by our actions in numerous instances been the means of improving the station man's wages during the war, as can be observed on reference to the *Labour Gazette*.

The reprehensible tactics of this Association in the Technical Press are too obvious to need any comment from us; sufficient is it for us to notice that so appreciative are they of our progress that every move we make they follow, but never lead. The value of the Association is clearly stated by Mr. Ebben in the *ELECTRICAL REVIEW* of June 14th, 1917, when he states:—

"He seconded an amendment which was proposed by a member of the Electrical Trades Union at a meeting of electrical employers

and employes in London some years ago. This was the only time the electrical engineers took the A.E.S.E. seriously; as soon as the General Committee and members severed all connection with the E.T.U., the London chief engineers, being clever and far-seeing men, ignored the A.E.S.E. members, and have done so ever since, because they knew they had nothing to fear."

Any further justification for our present action is contained in the remarks of the Editor, ELECTRICAL REVIEW, September 28th, when he states:—

"We cannot recommend young men of ability and ambition to join the staffs of power stations, unless it be for the purpose of acquiring a first-hand knowledge of the organisation and working conditions of such stations as part of their technical training and not as a career."

In conclusion, it has been suggested that the E.T.U. are unpatriotic. This can be at once denied, as hundreds of our members are on active service, and are being kept in full benefit by the members at home, and on a ballot for continuance of the war, or against, an overwhelming majority voted in favour of continuance to a successful issue. It must be clearly understood that the E.T.U. is not ruled by any individual, but by a National Executive elected by all members in Great Britain and Ireland.

H. H. Morton,
Secretary of Station Engineers,
No. 1 London Branch.

London, S.E.,
October 29th, 1917.

The article in your valuable journal, enclosing the letters addressed to Sir George Askwith, is lacking one thing, and that is Sir George Askwith's reply to the request for the A.E.S.E. to be represented at the next conference.

The following is the letter:—

[COPY.]

"Chief Industrial Commissioner's Department,
"Ministry of Labour, Montagu House,
"Whitehall, S.W. 1.
"October 18th, 1917.

"Dear Sir.—With reference to your letters of September 17th and October 16th, any further conferences will be held between the Unions by whom claims have been made and representatives of the Borough Councils, and I suggest that you should communicate on the subject with Mr. W. J. Webb, Electrical Trades Union, 76, Gray's Inn Road, W.C. 1.

"I am, yours faithfully,
"(Signed) G. R. ASKWITH.

"W. Arthur Jones, Esq., A.M.I.E.E.,
"Association of Electrical Station Engineers,
"26, Little Park Gardens, Enfield."

The notice as to the adjustments of rates and wages for the men employed by the St. Pancras Borough Council is also incomplete, as the following letter also shows:—

[COPY.]

"St. Pancras Borough Council,
"Town Clerk's Department,
"Town Hall, Pancras Road, N.W. 1.
"October 26th, 1917.

"Dear Sir,—With reference to your communication of the 16th of June last, I have to inform you that the Council have received a report from their Electricity and Public Lighting Committee, also a report from the Special Committee who have considered the question of the wages and war bonus paid to the employes of the electricity undertaking. The Council have revised the scale of wages for the employes of the electricity department, and I enclose for your information a copy of the revised scale.

"In addition to this, the Council are granting the employes of the electricity undertaking a war bonus of 15s. per week to those who are 18 years of age and over, and who receive a wage or salary of not more than £160 per annum, 7s. 6d. per week from £160 to £200, 5s. from £200 to £250.

"Yours faithfully,
"(Signed) C. BARRETT,
"Town Clerk.

"Mr. W. J. Webb,
"Electrical Trades Union,
"76, Gray's Inn Road, W.C."

The staff also of the North Metropolitan Electric Power Supply Co. have something to thank the Electrical Trades Union for, as the following letter will show:—

[COPY.]

"The North Metropolitan Electric Power Supply Co.,
"Electric Railway House,
"Broadway, Westminster, S.W. 1.
"October 17th, 1917.

"Dear Sir.—In reference to the conference which took place this morning at the office of the Industrial Commissioner, and to the subsequent interview which the general manager of the company and I had with representatives of your Union, I undertake that the company will, as from the week commencing September 1st, 1917, grant to the undermentioned grades (adults only) a war wage of 15s. a week, or such less sum as will bring up to 15s. a week the increase or increases in the wages granted since the outbreak of the present war, provided that where the wage of any man has been increased since the outbreak of the war by reason of his promotion to a higher or more responsible job, such increase is

not to be taken into account in assessing the amount of the war wage.

"It is understood that the above arrangement only apply weekly or hourly paid men.

"In regard to boys and youths under 18 years of age, the 6s. 6d. a week is to apply in place of the 15s. a week above mentioned.

"List of Grades.

- "Electrical fitters and their mates.
- "Shift or charge engineers (senior and junior).
- "Switchboard attendants (senior and junior).
- "Electrical erectors.
- "Wiremen and their assistants.
- "Jointers and their assistants.
- "Are lamp trimmers.

"Will you be good enough to acknowledge the safe receipt of this letter?

"Yours faithfully,

"THE NORTH METROPOLITAN ELECTRIC
POWER SUPPLY CO.,

"(Signed) JAMES DEVONSHIRE,
"Managing Director.

"W. J. Webb, Esq., London District Secretary,
"The Electrical Trades Union,
"76, Gray's Inn Road, E.C. 1."

The claim of the A.E.S.E. as being the Association to represent charge engineers is too laughable for words, and one wonders whether that is the reason that Mr. Ebben is no longer the hon. sec. From my personal knowledge of Mr. Ebben, when I was a member of the A.E.S.E., he would not stoop to the touting tactics now being adopted by certain engineers. Not touting for membership of the A.E.S.E., but touting (peaceful persuasion, one might almost call it) by engineers for Bill Smith (sub-station attendant) to say that the Electrical Trade Union does not represent him (Bill Smith), but the Electrical Trade Union is going on its way undisturbed, doing its best to obtain living conditions for station engineers of all grades.

W. J. Webb, London District Secretary.

London, E.C., October 29th, 1917.

The Prospects of the Central-Station Engineer.

To those who have followed closely the recent development of the Association movement amongst London power-station engineers, it must come as a great relief to realise that a serious crisis in their history has been circumvented. By how narrow a margin the situation has been saved, only those who have made it their immediate concern to steer the course can fully appreciate.

To get a true perspective, it is first necessary to view the relationship in which central stations stand to the engineering industry and to the war. It is in no sense an over-statement of the case to place power stations in the position of the hub of the engineering industry—the greater proportion of the efforts of which industry are directed into war channels. The full significance of this statement will be realised if the paralysis following a stoppage of all power-station output can be imagined.

The next step is to note how many engineers are responsible for the smooth and uninterrupted running of this hub. So far as London is concerned they number, not thousands, but just a few hundreds. Now picture the strength of the weapon which would be placed in the hands of an unscrupulous Association, Union, or Society. There is no need to labour the point—it must surely project itself right into the haziest vision.

To enlarge the perspective—what reward has accrued to those few hundred engineers, from chief to junior, who daily, during the past years, have shouldered increasing responsibilities and considerable additional work? They have seen outputs trebled and quadrupled profits beyond the dreams of avarice piled up on their industry, energy, and experience; and, let this not be forgotten, meanwhile nailed to the posts.

The exigencies of war demanded it, and they were content—content to see the market value of their stock-in-trade of experience depreciate 50 per cent.; content to rub along under conditions that would charge a Trade Union official with high explosive.

Trade Unions up and down the country did not sit still under the increasing oppressiveness, and all grades of war workers, by and around that gallant few hundreds, have been considered, and considered well. Moreover, some of those Unions were stretching a welcoming hand to those few hundreds—whether or no it was an interest with a single purpose is beside the point. The temptation was great.

The answer of those few hundreds to the overtures so made must redound to their ever-lasting credit, and it must be self-evident that they are made of the right stuff. The answer in effect was: This is our career—an engineer's career. True, the rewards for our industry and efforts fall lamentably short of the barest justice; but our career means more to us than the immediate acquisition of shillings. We prefer to adjust our own affairs, and will not allow any menace to the smooth running of the industrial career. The exigencies of war demand that some of those men are about to come under review by the London supply authorities. Is it too much to ask that a correct estimate be taken of their value—a true sense of appreciation formed of their action in banding themselves together—the preservation of their entity, and all that it means to the future of central station life, from chief to juniors? The gift of clear and expansive vision was never in greater demand amongst those about to mete out justice—not generosity—to those few hundred.

One of the Herd.

As a humble unit in central-station life, may I claim the privilege of tendering my thanks for the able manner in which you are supporting the much-discussed "engineer"? Moreover, your footnote to a letter of "Staff Electrician" in the issue of September 28th, has drawn an adverse criticism, in which the argument put forward is open to endless discussion.

The letter from your Manchester correspondent is the first of its kind up to the present, and, quoting the old adage that "Open confession is good for the soul," may we not confidently look forward to expressions of opinion from senior engineers, both London and Provincial?

A well-known business gentleman has stated recently that it is the old men who, at present, are running the world and the war, and we must not lose sight of the fact that the chief engineer of to-day is the same chief of the early days (in the majority of cases), and in these tumultuous times he has not had time to spare to carefully consider the immediate needs of his juniors.

The time has surely come when a member of the staff can approach his chief, and feel that he is not hampered in his quest by a fixed scale, and the usual referring to committee.

It has often been said that, if a position is not good enough for one, he should "get out." Is this always the right policy to pursue? And, to return to your correspondent's letter, he says: "Young men of ability and ambition are sorely wanted"—yes, and these young men will always be forthcoming, whose enthusiasm for their work often makes them forget the energy involved; are these men to meet the same reward as those who started years ago?

Engineer.

After reading through the correspondence on the militant organisation of power-station engineers, I am struck with the fact that the most salient feature of most of the writers is the emphasis which they lay upon "status." Surely it was high time that this nonsense was dropped. Status is a bogey which has been and always will be the enemy of democratic, and consequently real, progress.

The "superior technical staffs" may be very excellent people, and probably very clever too, but it never struck me that the mechanical routine of power-station operation was beyond the powers of any man of average intelligence and ordinary training; consequently, it is a source of amusement to observe the frantic efforts which the "Gabriels" of the recently resuscitated A.E.S.E. make in loudly trumpeting their patrician isolation.

The fact is quite clear that until the E.T.U. proved that they were alive, the "superior gentlemen" were still *ensomme*, and no doubt were waiting until post-war days before demanding an adequate wage to meet ferocious and continuously advancing prices. It is well to point out that the Labour movement in its new phase will need, and will get, men of capacity in its leading ranks. The superior brand of status-hunters will find themselves left completely frigid if they imagine that status will confer upon them any degree of effective force. They will learn that they must fight to obtain any improvement in salary, wages, or conditions, and a digest of any of the economic historians will prove to them that the fighting will be hard fighting too. It is beside the point to indicate the might of the organised medical and legal professions; these bodies have State protection—a bolster which no Government will be inclined to bestow further.

My advice to the authors of the long circular which secured free advertisement in the ELECTRICAL REVIEW columns, is to discard the "stilts" and come down to democratic terra-firma. As an electrical man in charge of a mere converting plant, I am no doubt offering impudent advice; but when I see the portents of increased centralisation of power supply, I think that many of the men at present numbered among the power station "superior" staff may be looking for jobs in competition with the sub-station charge or shift engineers who are so socially and technically "impossible."

W. F. K.

London, S.E., October 28th, 1917.

The Association Movement.

Although I have not recently had an opportunity of reading the ELECTRICAL REVIEW, I understand that a difference of opinion has arisen in your "Correspondence" columns concerning the origin of the Cable-Makers' Association.

As one who was present at the first meeting, I can say that all of those who attended that meeting have frequently referred to Mr. Henry Edmunds as the father of the C.M.A. At the same time, it is a fact that I was first approached, so far as the cable works at Charlton were concerned, by Mr. H. H. Berry.

F. S. Paterson.

Lieut. R.E. (T).

October 29th, 1917.

Apprenticeship In Electricity Supply.

I was interested to read in your issue of October 19th the course of training laid down for apprentices in the employment of your correspondent. Now, I think it is only fair to recommend parents of would-be apprentices who should be tempted to have their children bound to such luring employers to look before they leap.

As far as my own experience goes, I have been one of those who have been gulled by a similar advert. for electrical engineering apprentices. The fee was rather high (£50) considering that no pocket-money was allowed during the first 12 months, and also taking into account that my parents had to pay for my keep whilst out of home. The course of training was anything but near that laid down in my "indentures." Of the wiring work which was to

consist of motors, heating and cooking apparatus, &c., I only saw two motors being installed during my term of apprenticeship, and I think three cookers was about the limit of our cooker wiring. Your correspondent explains what our wiring contracts were like when he says they were "not large." No they were not large—the largest was one of 20 lights. The extent of our modern instruments for mains and meter testing consisted of one antiquated P.O. bridge and a Megger for the former tests, and for the latter we had a unipivot dynamometer about 10 years old.

The plant consisted of two water turbines and an old-fashioned horizontal steam-engine which should have been scrapped A.D. 1900. The generators were A.C. Morley Victoria, the newest of which, according to our cable jointer, who seemed to have been in the service of the company since its inauguration, was about 22 years old. The only mechanical repairs I saw during my term were the renewal of a few armature coils and the recasting of one generator bearing.

I also note what your correspondent says about the type of apprentice which they take on not being able to afford a mechanical training. Now, I would wish to ask him if for the fee he charges, (as I don't think he would be so kind as to give all his knowledge gratis), does he honestly think that any parent could make better use of his money than handing it over to the "manager of an electricity supply" that his son may obtain a knowledge of electrical engineering equal to, or if I might say so, less than that which may be had at any technical school at a less cost?

I do not wish to occupy too much of your valuable paper. I only wish to point out to parents of would-be engineers what a risk they take in having their sons apprenticed in a small power station where the manager distinctly states that the training is to be given as far as his knowledge goes. It would be far better for them to pay a little more at first and get their charges into a proper engineering firm, the owners of which aim at turning out engineers and who do not take on apprentices just because they wish to run their power stations cheaper than if proper engineers were employed.

Pro Bono Publico.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

Drying Fruit and Vegetables by Warm Air from Turbo-Alternators, &c.

The Duisburg electricity station has erected a series of racks on which fruit and vegetables may be dried by the warm ventilating air escaping from turbo-alternators. This idea is due to the station engineer Fietz. The arrangement used is shown in the accompanying sketch. At the cost of a very small outlay, the staff and workpeople of the station have been enabled to dry a large part of their winter requirements of fruit and vegetables. The proposition deserves to be taken up by central-station engineers in this country. It should be possible, even at this late season, to add materially to the storable food supplies of the nation, and this without burning any additional fuel or incurring any serious capital expenditure.

The additional equipment required commences where the ventilating air leaves the alternator casing. The warm air, which

FIG. 1.—ARRANGEMENT OF DRYING APPARATUS.

is filtered as a matter of course before being admitted to the ventilating machine, is taken through a suitable duct to the bottom of a drying press, which consists of a sheet-iron enclosure containing a series of wire-netting drying trays. The top of the enclosure is open, but a roof is set about a yard above it to keep off rain and dirt. The drying trays are removable for filling and emptying, and provision is made for controlling the air flow. The sketch shows accommodation for 12 trays (2.05 m., or 6 ft. 9 in. in overall height) and the inside dimensions of each compartment are 1.00 × 0.95 × 3.00 mm. (about 39½ in. × 37½ in. × 12 in.). The trays, if not the rest of the iron work, should be galvanised to prevent rusting. About 22 lb. of vegetables can be dried in each tray, and from four to five hours is sufficient to dry vegetables or sliced fruit.

Condensing Plant.

An interesting catalogue (No. 38) of condensing equipment has just been issued by MESSRS COLE, MARCHENT & MORLEY, LTD., of Bradford, which covers many examples of independent plant suitable for turbines and reciprocating engines. The equipment is of the low-level jet, barometric jet and surface types. As regards the former, both the weir and nozzle patterns are supplied, and

the firm's patent vacuum breaker is fitted, which, in the event of the water in the condenser body rising above a predetermined level, operates in such a way as to admit air to the system until the vacuum is reduced and the working level regained, when normal working is automatically reintroduced.

In connection with surface condensing plants, Messrs Cole, Marchent & Morley are prepared to supply any of the recognised types of equipment, with either reciprocating or rotary pumps. In many cases the well-known Edwards type of air pump is adopted, but the firm are also building a well-known type of rotary air-pump, and as an alternative they are prepared to supply a double-acting horizontal dry vacuum pump, which can be designed with multiple stages, when very high vacua are desired.

FIG. 2.—COLE, MARCHENT & MORLEY CONDENSING PLANT.

The catalogue is well illustrated, and we select a view, fig. 2, showing a standard surface condensing plant, operating in conjunction with a 2,000-kw. turbine set. This condenser is, owing to special conditions, placed beside the turbine, and is provided with rotary air and extraction, and circulating pumps coupled to the same shaft and driven by an electric motor.

LEGAL.

THE OSRAM-ROBERTSON LAMP WORKS, LTD., v. POPE'S ELECTRIC LAMP CO., LTD.—APPEAL ALLOWED.

AT the House of Lords, on October 25th, judgment was given in the appeal by the Osram-Robertson Lamp Works, Ltd., from an order of the Court of Appeal affirming a judgment of Mr. Justice Joyce in the Chancery Division. The action was brought by the present appellants to restrain the respondents, Pope's Electric Lamp Co., Ltd., from producing filaments of pure tungsten for use in electric lamps under a process which the appellants contended was an infringement of their Patent No. 23,899*, of 1904. Both Courts below held that there was no infringement, as the process used by the respondents was substantially different from the process described in the specification of the patent sued on, and the action was therefore dismissed with costs. The case was reported in the ELECTRICAL REVIEW of July 2nd—23rd, 1915, and the hearing before the Court of Appeal in our issues of November 19th—December 31st, 1915. The appeal was heard on 10 different days, and judgment was reserved on July 9th.

Mr. Walter, K.C., Mr. Colefax, K.C., and Mr. Gray appeared for the appellant company; Mr. Thos. Terrell, K.C., Mr. E. M. Kirby, K.C., and Mr. E. Russell-Clarke for the respondents.

Their Lordships differed in opinion. The Lord Chancellor, Lord Atkinson, and Lord Parker were for allowing the appeal, while Viscount Haldane and Lord Parmoor were for dismissing it. By a majority of three to two the appeal was allowed.

The LORD CHANCELLOR, in the course of his judgment, said:—The patent was granted to Alexander Just and Franz Hanaman. A patent had been granted to Welsbach (No. 1,535 of 1898) for the manufacture of filaments from osmium, and the method of manufacturing such filaments as described in his patent was adopted in the appellants' patent and applied to the manufacturing of filaments from tungsten. There can be no doubt that the application of an old method to a new substance may constitute a good subject matter for a patent if invention is required for the application. According to the specification, the tungsten or tungsten compound is to be mixed with an organic binding medium "such as collodion or a solution of cellulose in chloride of zinc or cupreous ammonia oxide or the like." From the mass so formed filaments are to be formed in the usual manner. The filaments are then to be carbonised—that is, they are to be subjected to heat in the absence of

oxygen as in the manufacture of charcoal, so that the other materials are driven off by destructive distillation and the carbon is left. The specification goes on to direct that the filaments are to be subjected to the following further treatment:—"First of all the carbon which has only served as a binding medium, is removed by subjecting the filaments to the passage of current in an atmosphere of steam and hydrogen, and thus raising it to a high temperature. By this means the carbon is completely oxidised so as to form carbonic oxide, and the filament of tungsten is left." It is mainly upon this last passage that the question of infringement depends, for the defendants do not heat the filament by passing the electric current through it but by the agency of external heat, and they do not subject the heated filaments to an atmosphere of steam and hydrogen formed *ab extra*, but it is alleged by the appellants that such an atmosphere is created *ab intra* by the heat, and that the respondents' process is in substance the appellants'.

In my opinion the respondents' process does amount to an infringement of the appellants' patent. The great merit of the appellants' patent consists in the discovery that tungsten can be successfully used for the manufacture of filaments for electric lamps. The respondents, like the appellants, used tungsten for this purpose, but say that they did so by a process different from that of the appellants. It was alleged by the respondents that the appellants used a "soft paste," there being a larger proportion of the binding material than of the metal, while the respondents use a "hard paste" composed of the metal with only enough of the binding material to act as a lubricant. It appears to me that the binding material is used as such in both processes, and that there is no ground for the respondents' contention that the filament is formed by them merely by the cohesion of the metallic particles under the pressure by which it is forced through the aperture. In both cases the cohesion is due to the presence of the binding material. On this point there is substantial identity between the appellants' patent and the respondents' processes. The filaments when formed are, according to the patent, to be "carbonised," and the respondents contend that there is no carbonisation by them as a distinct step. As a matter of fact, the respondents carry out carbonisation while the filaments are passing through the first furnace. In each case carbonisation is effected, and

there is no material difference between the two processes on this point.

The serious contest on the issue of infringement was raised on the passage of the specification which describes the treatment of the filament by the passage of current in an atmosphere of steam and hydrogen. Upon this the respondents made two points. First, that there is no infringement, because they apply heat externally to the furnace, and not by passing the electric current through the filament; and, secondly, that they do not use an atmosphere of steam and hydrogen. It appears to me that the passage of the electric current was used in the appellants' process merely to produce a high temperature, and not for the sake of any other effect on the filament by the application of electricity, and that, in fact, it operated only by the production of a high temperature. It follows that if a high temperature be applied *ab extra* to effect the same purpose as by passing the filament through a furnace, the respondents cannot escape liability by this variation in the means used to produce the requisite temperature. In substance, the appellants' process is adopted on this point.

A more serious question was raised upon the point that the specification prescribes the use of an atmosphere of "steam and hydrogen," in which the filaments are to be raised to a high temperature, the respondents denying that they use any such atmosphere. It was admitted by the appellants that they could not succeed on this appeal unless it could be shown that the process of the respondents, in substance, consists in the application of an atmosphere of steam and hydrogen.

When the process described in the patent is carried out, the water forming the steam is decomposed by the carbon in the filaments and carbonic oxide is formed, so that ultimately the whole of the carbon is removed. At the same time the hydrogen liberated by the decomposition of the steam, as well as the hydrogen which forms part of the "atmosphere" prescribed by the specification, combines with the oxygen which is to be found in all commercial tungsten and forms more steam. In the result, the carbon disappears and a pure metallic filament of tungsten is left. The agent by which the carbon is removed is the water forming the steam, the oxygen of which, at a temperature of 700° C., or thereabouts, combines with the carbon. In comparing with this the process carried on by the respondents, although they are superficially different, I think the two are in substance the same.

His Lordship then dealt with the evidence given as to the two processes, and said that it was claimed by the respondents that there were advantages in their process which were not possessed by that in the terms of the patent of the appellants. He thought that was the case, and that there were improvements in a process followed by the respondents as compared with that under the patent. But the fact of improvements did not cure the fact that the respondents' process was substantially one which employed an atmosphere of steam and hydrogen. Upon the whole, he came to the conclusion that the respondents had infringed the appellants' patent.

It remained to consider the question whether the patent was valid, and his Lordship dealing with this point said:—

The objections are set out in the particulars of objections, and may be summarised as follows:—First, want of novelty; second, want of subject-matter; third, want of utility; fourth, insufficiency, ambiguity, and misleading nature of description of process. The first and second of these objections, in my opinion, fail. The application of the Welsbach method of manufacture to tungsten was new. Tungsten and its compounds were excluded by Welsbach from his patent, and it required invention and experiment to find out that this method could be successfully applied to tungsten. The third objection also fails upon the evidence, as there can be no question as to the utility of the invention. The fourth head of objection requires careful examination so far as it depends on the allegation that filaments cannot be made by employing with tungsten a solution of cellulose in cupreous ammonia oxide. This point depends upon the interpretation to be put upon the first sentence of the instructions in the specification. If that sentence is to be read as directing that either tungsten or any one of its compounds may be mixed with any one of the forms of organic binding material which are mentioned—viz., collodion or a solution of cellulose in chloride of zinc or cupreous ammonia oxide—the patent would be bad. The solution of cellulose in cupreous ammonia oxide may be used with tungsten compounds, such as tungstite, tungstic acid, or tungstic sulphide, but not with tungsten itself. It follows that if the specification directs that it may be so used, the direction is misleading and the patent would be vitiated. In the present case the evidence establishes that it was well known in 1901 to everyone who had experience in making filaments that if cupreous ammonia oxide were used as a solvent for the cellulose, the result would be a failure if the metal tungsten were used with it. This was proved at a very early stage of the case by Dr. Passmore, a witness for the appellants. The fact that the cupreous ammonia solution of cellulose would act with all the enumerated compounds of tungsten is sufficient to support the language of the specification. Upon the whole, I think that the objection to the validity of the patent fails. I may add that if the language be ambiguous, a construction which will give effect to the patent is upon the authorities to be preferred to one which would nullify it. As, in my opinion, the patent is valid and infringement has been established, I think that this appeal ought to be allowed.

Lord Haldane's judgment (which was read by Lord Dunedin) was in favour of the appeal being dismissed. Having dealt with the facts, and compared the process as described with that proposed by Welsbach for application to osmium, he stated that the distinction between "hard" and "soft" paste was not material. The respondents did not heat their filaments by the passage of a current, and while in one of their processes they applied external heat in a current of hydrogen, there was no atmosphere of steam, as prescribed in the patent sued on. Even if hydrogen and water vapour were present in the way suggested, he did not think that they were present in such a fashion as to constitute such "an atmosphere of steam and hydrogen" as Just & Hanaman's specification directs to be employed. There might be present no steam at all excepting what the action of the hydrogen on the oxide of tungsten called momentarily into being. Any combination of hydrogen with oxygen which formed steam was brought into, and at once dissociated, by the new combination which its oxygen straightway formed with the carbon. No prepared atmosphere of steam was required or provided for. He was therefore of opinion that, so far as this aspect of the respondents' processes was concerned, it did not infringe the methods directed by the specification. Moreover, the respondents' mode of manufacture, unlike that of the appellants', does not require free carbon at any stage. The appellants' patent was one only for a process in which known factors were combined in a particular fashion. The novelty lay in the fashion of combination, and the fashion of the respondents' combination was of a substantially different character, to which the doctrine of equivalents had no application.

With regard to the question of validity, in his opinion the patent indicated a useful and patentable invention. But a question arose whether the practical directions which the specification gave were sufficient even for a trained lamp maker. It told those to whom it was addressed that they might take finely divided tungsten and mix it with cupreous ammonia oxide. It was admitted that this would not work. The instruction in regard to tungsten appeared to him to be unambiguous, and consequently fatal to the validity of the patent. For these reasons he thought that the appeal failed, and ought to be dismissed with costs.

LORD ATKINSON read an extremely long judgment prepared by Lord Parker, who was for allowing the appeal. He said that he so entirely agreed with the opinion expressed by Lord Parker that it was unnecessary for him to deliver a separate judgment. He agreed in the appeal being allowed.

LORD PARMEOR read a judgment agreeing with the opinion expressed by Lord Haldane.

On the motion of the LORD CHANCELLOR the appeal was allowed, with costs, in the terms of the prayer.

SOCIÉTÉ ÉLECTRIQUE DE PARIS v. ADAM BROMLEY & SON, LTD. In the King's Bench Division, last week, before Mr. Justice Bailhache, plaintiffs brought this action against defendants, who are coal merchants of London, to recover damages for alleged breaches by the defendants of contracts for the supply of coals to the plaintiffs *c.i.f.* Rouen.

The case for the plaintiffs was that they were a large company with vast electrical power undertakings in Paris. They supplied electrical power to various tube railways, munition works and

factories, and required to have some 500 tons of coal per day. When the supplies in France became depleted they had to make arrangements to get coal here, and they entered into various contracts with the defendants, breaches of which were now alleged. The defendants set up a variety of defences to the contention of the plaintiffs that they failed to make proper deliveries at the proper times. The defendants relied on the condition of things brought about by the war, and pleaded that the contract was ended.

Ultimately the case was settled in Court on terms agreed between the parties, the terms providing that the plaintiffs should have the taxed costs of the action, and that money should be paid out to them that they had paid into Court as security for costs.

HOUSE OF LORDS APPEAL.

THE appeal of the Metropolitan Water Board against the order of the Appeal Court reversing a judgment of Mr. Justice Bray, in the case between the Board and Messrs. Dick, Kerr & Co., Ltd., was before the House of Lords on Thursday last week. It will be remembered that the litigation related to contracts for the construction of reservoirs, the execution of which was interfered with by the Ministry of Munitions.

DAMAGING ELECTRIC LAMPS.

AT Dublin Southern Police Court, Eric Cantley, a boy of 15, was convicted, at the instance of the Pembroke Urban Council, of damaging public electric lamps and extinguishing the lights. He was ordered to find bail in £5, or, in default, to be imprisoned for a fortnight and to pay £1 compensation.

KENT v. LIVERPOOL CORPORATION.

IN the Liverpool Court of Passage, last week, Judge Taylor, K.C., gave his decision in an interesting case in which he had previously reserved judgment. The case was one in which Mrs. Caroline Kent, broker, of Wavertree Road, claimed damages from the Liverpool Corporation for personal injuries. The plaintiff was standing in the London Road, when part of the overhead tramway wire fell unexpectedly, and she received a fright or shock. She suffered some illness and was put to expense, and she claimed damages for alleged negligence.

HIS LORDSHIP, in giving judgment, said it was clear that the general management of the overhead wires was without fault. The accident happened at what was known as a section insulator. There was a cap or cup, inside of which was a screw, and the accident would not have happened if the screw had not become unscrewed. For the plaintiff an expert suggested that the copper screw had not been tightened, and that it might have become unscrewed by passing traffic or vibration. The Corporation expert held that it was wrong to draw that inference, because it was extremely unlikely that their servant would be guilty of such a thing, and that one ought to assume that some accident had happened, such as a stone thrown by a boy, which had produced the unscrewing. It was not an ordinary case, and no accident of the kind had happened before. That was extraordinary when one considered the number of years the system had been working, and the number of section insulators.

HIS LORDSHIP concluded that the mishap was much less likely to be due to negligence of Corporation workmen than to an accident. He was satisfied that it was not due to negligence, and he gave a verdict for the defendants.

WAR ITEMS.

Exports to China.—The "London Gazette" for October 30th contains a further list of bodies and persons to whom exports to China may be consigned.

Tar Oils.—An Order is published under which the Minister of Munitions will from November 1st take possession of all tar oils in the United Kingdom.

Leaving Certificates.—The question having arisen as to whether Section 3 of the Munitions of War Act, 1917, enables a workman who has undertaken the performance of a definite job to give a week's notice and leave before the completion of the job, the Minister of Munitions announces that he has been advised that the section does not apply to contracts of service for a definite period or for the doing of a particular job, but is confined to contracts which, apart from the Act, are determinable by notice or at pleasure. The answer is, therefore, that the section does not enable a workman who has undertaken the performance of a definite job to give a week's notice and leave before the performance of the job.—*Daily Telegraph*.

Reports received from several parts of the provinces go to show that the operation of the leaving certificates alteration is causing disquiet among the workers, because it is said that in certain cases men have been refused employment by one firm because they have left the employment of another. There are suspicions that employers in a district have agreed among themselves to prevent workmen leaving one shop and going to another. Trouble is threatened if this is proved to be correct. In one district it is complained

that men have travelled long distances in order to settle upon new work, by arrangement with a foreman, and have been dismissed after a few hours. Birmingham, Manchester, and several other places are mentioned as centres of dissatisfaction.

Coal Shortage in Russia.—The "Times" correspondent at Odessa states that since the revolution the miners in Russia have been working short time, and devoting their attention to politics. There has been a progressive decline month by month in output. The writer adds that "unfortunately wood cannot be used as a substitute for coal in the furnaces of many large factories, waterworks, electric light and similar works. The closure of these institutions would turn into the streets thousands of men. The serious character of the outlook is now recognised by the revolutionary authorities here, who have appointed a committee to deal with the question."

Trading with the Enemy.—The "London Gazette" for August 26th contains names of further bodies and persons with whom trading is prohibited in Argentina, Paraguay and Uruguay, Brazil, Chile, Ecuador, Greece, Morocco, Netherlands, Netherlands East Indies, Norway, Persia, Peru, Spain, Sweden, and Venezuela.

Engineers' Bonus.—With reference to the Order published in our last issue, the following official list sets forth certain occupations in which skilled men employed under the conditions prescribed in the Order are entitled to the bonus of 12½ per cent. Only those skilled men in the specified occupations who are paid at or above the current district time rate for turners or fitters are covered by the provisions of the Order:—Blacksmith, borer, coremaker, fitter, gauge maker, gear cutter, grinder, hardener and temperer, jig maker, miller, millwright, moulder, patternmaker, planer, shaper, slotter, toolmaker, toolsmith, turner.

Also skilled men employed in the following capacities whose trade is one of those specified above:—Charge hand, draughtsman, examiner, foreman, gauger, inspector, marker off, rate-fixer, setter-up, viewman.

Leaving Certificates and Electrical Undertakings.—Early in October, before the date for the abolition of Leaving Certificates, a deputation from the Tramways & Light Railways Association, the Incorporated Association of Electric Power Companies, and other associations, sent a deputation to the Ministry of Munitions to show the possible effect of such abolition upon their undertakings. As a result, a memorandum was submitted explaining the situation and advancing suggestions for meeting it. This memorandum appears in the October issue of the Tramways and Light Railways Association *Journal*. It was stated that the staffs of these undertakings had been heavily depleted already, and any alteration which might have the effect of still further reducing the labour necessary was viewed with the gravest apprehension.

The operations of electricity, tramway, and gas undertakings are carried on under Statute, and differ from those of many other industries which could restrict their output at their own discretion. They, however, were bound by Acts of Parliament to give and maintain their services. The memorandum continued:—

"Public service undertakings demand special consideration. Any insufficiency of the necessary labour will affect not our own concerns only, but will most seriously interfere with the output and operation of thousands of firms who employ many times more men than the public services, by stoppage of traffic facilities and supplies of electricity and gas used for power and other industrial purposes. It is understood that there is no possibility of the Government reconsidering the proposed withdrawal of Leaving Certificates, but we would suggest that the position would be rendered less difficult if it were possible to enact that the power of leaving should be limited to movements within each particular trade, and also that the period for giving notice of any proposed transfer of service should not be less than one month."

In case no modification of the abolition could be entertained the memorandum, in reply to the request of the Ministry, formulated suggestions for easing the situation:—

1. All skilled and semi-skilled men (and also unskilled men who have special training) who have been taken from public services to serve with H.M. Forces, should be restored at the earliest possible date.

2. The heavy burdens already put upon us by frequent increases in wages, and the possibility of further increases and alterations in conditions of employment now being demanded, should be met by giving to:—

(a) Electric Lighting and Power Undertakings—authority to increase prices (if necessary above the present statutory maxima) by way of an adjustment of charges in proportion to the increased wages paid. This would entail amendment of existing long-time contracts.

(b) Electric Tramway Undertakings—authority to raise or revise their fares, including workmen's fares.

(c) Gas Undertakings—relief from the operations of sliding scale and maximum price regulations.

It was also recommended that in order to facilitate the work required of public service undertakings, higher class priority certificates should be issued for materials. This would have the effect, amongst others, of economising labour.

In the Parliamentary questions, Sir G. Toulton asked the Minister of Munitions whether, in view of the abolition of leaving certificates, he had considered the question of protecting electricity undertakings from the danger of interruption arising from the loss of their men and consequent difficulties in the supply of electrical energy to munition and other works; if he was aware that his predecessor recognised the gravity of the position, and undertook that this aspect of the matter would be borne in mind on any amendment of the

Munitions of War Act, 1915; and if he would say whether he proposed to take any steps in the matter.

Mr. Churchill, in reply, said he had received representations on this matter from the interests affected, and he was fully alive to the importance of their being able to retain or secure an adequate supply of labour. While he had no reason to think that the difficulties would be as serious as the representatives of these undertakings anticipated, he was prepared to take whatever steps were possible to meet such difficulties as might arise.

Exemption Applications.—In our report last week of the application respecting Mr. C. C. Hodges, we stated that he was doing the work of the Dawlish electric light concern with the aid of two pupils. What was actually stated at the Tribunal was that he *had been* doing the work. As a matter of fact, he was doing so for three weeks owing to inability to secure a stoker-driver. One had, however, been obtained some days before the hearing.

At Burnley, an electrical fitter, aged 29, B.I., was appealed for, his employer stating that he was the only man he had at present, whereas he usually had five or six. He was responsible for looking after the electrical equipment of several large works. The Tribunal thought the man ought to have a certificate, and they adjourned the case to the end of the year to enable him to get one.

Camberwell Tribunal have unanimously adopted a resolution, which is to be forwarded to the Army Council and the Local Government Board, protesting against the retention of young men in Woolwich Arsenal, fit for general service, whilst they were called upon to send into the Army men between 35 and 41 years of age, in low medical categories. The Military Representative said there was a certain amount of combing-out now going on at Woolwich Arsenal, as the Munitions Area Recruiting Officer was withdrawing certificates every week. Mr. May said it was about time something was done, for these young men were being granted protection by the M.A.R.O., doing work which could easily be learnt by older men in a very short time.

At Southwark, Mr. W. H. Donovan, a director of the London Commercial Electric Stores, Ltd., of 13, Farringdon Avenue, was summoned to show cause why his certificate of conditional exemption should not be withdrawn. He was 36 years of age, and passed for sedentary work at home (C3). He stated that he did all the buying, and had been granted his exemption on domestic and medical grounds. He supported his father and mother, aged 74 and 68 years. They had a turnover at the firm of £30,000 a year. There was another director, who was a Czech. He stated that he had not joined the V.T.C. or the Special Police, although it was a condition of his exemption that he should do something of this kind. The Chairman: We asked you to do something—to make some sacrifice—but you have done nothing. Appellant said his business kept him fully occupied. Coun. Weaver: We can find work in the Army for C3 men like you. The case was adjourned for a month to enable appellant to join either the Special Police or the V.T.C.

At a West Riding Appeals Tribunal, at Dewsbury, last week, Messrs. Ward & Co., electrical engineers, Dewsbury, appealed for B. H. Allen (23, Class A, married), electrical fitter, and for H. Hirst (31, A, single), skilled wireman. Mr. Nicholson, representing the firm, admitted that both men were young and fit, but so was the electrical trade young, and it was not likely that old men could be obtained to do the work efficiently. He contended that the local tribunal had been wrong in deciding that the men were not in a certified occupation, and he referred to the official list. Major Collins (Military Representative) said the latest instructions were that such men as these were needed in the Army. Mr. Nicholson said the firm were the only electrical engineering contractors left in Dewsbury, and were engaged in electrical installation at the military base hospital at Staincliffe, work which had been much delayed owing to labour scarcity. They had also contracts in mills and collieries. In reply to a suggestion by the Military Representative that the firm were not on the Government list, Mr. Nicholson said they were in communication with the Ministry of Munitions on that matter. The appeals were dismissed, but grace was allowed to January 1st in the case of Allen, and December 1st in the case of Hirst, both final.

Further exemption on business and health grounds was sought at Hastings by P. W. Bridger (28, B3), electrician, engaged in his father's business. The Military opposed the appeal on the ground that applicant would be useful in the Army for electrical work. A final two months for a substitute to be found was granted.

Exemption until April 30th has been granted to H. W. Taylor (33, C2), electrical engineer, of Leyton, who attends to the wiring, &c., at the Council schools.

At Colchester, an arrangement was arrived at whereby certain men in the Corporation tramway department should be released for military service. It was stated that 64 men had been parted with, and that the Tramway Committee hesitated to adopt a suggestion to employ female drivers owing to the gradients and heavy military traffic in the streets.

At Brierley Hill, Messrs. Holmes & Cartwright, electricians, asked for further exemption for an electrical engineer (28, C2), the only one left capable of doing electrical work, and the only man in the district who could repair motors in local works. Three months were allowed.

At Kidderminster, exemption on the ground of being in a certified occupation was claimed by J. A. Mitchell (40, Class A), electrical engineer. Mr. Pilling, for the Military, said that after inquiry he was satisfied that appellant should have exemption, and conditional exemption was conceded.

At Quarry Bank, a works electrician (27) was appealed for by a firm of brush manufacturers. As he holds a red card, the appeal was resented *sine die*.

At Oxford, the Tramway Co. appealed for renewed exemption for M. F. Sadler (37, C1), unit adjuster, and C. W. Millard (37, C1), driver. The manager (Mr. A. A. Tyler) said that the men were absolutely necessary for the carrying on of the public service. Each was allowed three months' temporary exemption.

On a Military review, conditional exemption held by E. E. Hill (C2), engine driver at the Winscombe electric supply station, has been cancelled.

At Axbridge, Mr. S. Hill appealed for the retention of P. J. Brown (30), Class A, in charge of the electrical plant on an estate at Churchill. He was stated to be of no value as a soldier. The case was put back for substitution. Brown not to be called up until a suitable substitute is found.

An appeal was made to the Herts. Appeal Court by C. E. W. Parker (18), second-year student for electrical engineering, and now engaged as electrical fitter and draughtsman with Messrs. Vickers, Ltd., Crayford. Exemption was refused.

Herts. Appeal Court have granted six months' exemption to M. J. Connari (38, B2), electrician, of Watford.

Lancashire Appeal Court has refused an appeal by the Grove Dyeing Co., Littleborough, for the retention of J. Humphreys (26, Class A), electrician, and he is to report for service on November 30th.

Gloucestershire Appeal Court has dismissed a military appeal against the chief engineer to Messrs. T. B. Worth and Co., Thrupp, Stroud (34, A1), responsible for the running of the electricity plant, and six months' exemption was granted.

BUSINESS NOTES.

An Exhibition in New Zealand.—Notwithstanding all the difficulties of the present export trade situation, there has lately been organised and held at Hawera, New Zealand, an exhibition of British-made goods. The exhibition is due to the initiative of Mr. R. W. Dalton, H.M. Trade Commissioner in New Zealand, and its object has been to bring before buyers in that promising market manufactures made by British firms which will meet their requirements. The exhibition, which was well supported by agents and importers, included tires, hardware, tools, weighing machines, &c. It is hoped that other exhibitions of a like character will be held in other parts of the Dominion. As Mr. Dalton has shown in his reports, he attaches great importance to the matter of preparations during the war if we desire to secure and extend our hold on the New Zealand market. The present exhibition is a practical object-lesson of the advice that he gives. There can be no question about the future electrical importance of New Zealand, but British engineers will be required on the spot to show that British manufacturers are able to meet the market's needs, or else our disadvantages consequent upon the war will continue after the war, the advantage being gained by those who have now for some time reaped the benefit accruing to them from our occupation with munitions.

China Clay Combination.—It was stated at a meeting of the St. Austell China Clay Works, last week, that as the result of an agreement entered into with other china clay producing companies, with the exception of about 2 per cent. of the industry, there would be a great combination, which would ensure the regular distribution of the output of clay according to the capability of each company to produce it, and according to its quality of production. According to the *Times*, as a result the sale of the pre-war standard of the company's output was assured, as well as a fair and proper rate of wages, and the combination assured the master who had invested his money in china clay companies a fair and proper return for that investment. The result of the combine was that the price of their clay would immediately advance 33½ per cent., the supplies of coal from colliery proprietors would be regulated, and the china clay companies would be able to deal much better and more satisfactorily with the questions of railway transport and shipping facilities.

Book Notices.—"National Physical Laboratory: Collected Researches." Vol. XIII, 1916. London: Harrison & Sons, Price 20s. Also Report for 1916-17. From the Laboratory.

This volume of researches contains papers on optical apparatus, experiments on ship models, the hydrogen spectrum, the analysis of aluminium alloys, copper-tin alloys, and fuel oils, as well as one by Mr. Albert Campbell and Mr. D. W. Dye on "The Magnetic Testing of Bars" (I.E.E. paper), and one by Mr. F. E. Smith on "The Manufacture and Testing of Prismatic Compasses" (read before the Optical Society). An abstract of Messrs. Campbell and Dye's valuable paper has appeared in our pages. Mr. F. E. Smith's paper describes the tests applied to prismatic compasses for military purposes at the National Physical Laboratory, and discusses in detail the errors to which such instruments are liable, containing also a mass of

information of use to the manufacturers of compasses. The report on tests of fuel oils, carried out for the Royal Commission on Oil Fuel in 1914, by Messrs. J. R. Pannell and W. F. Higgins, covers the flow of oil in pipes and the physical constants of the oils.

Cycling Manual. London: Temple Press, Ltd. Price 9d. net.—This little book fills a want long felt by the multitude of "users" of bicycles, who far outnumber the class who may fairly claim the title of "cyclists" and stand less in need of instruction and advice with regard to their mounts. It professes to tell "all about cycles and cycling in simple language," and, so far as the choice, care, and repair of the bicycle are concerned, it fully attains its object. After an interested perusal of the whole of its contents, we are of opinion that no one who rides a bicycle should be without a copy of it.

"Terms of Industrial Peace." By A. Ramsay. London: Constable & Co. Price 3s. net.

"Power Wiring Diagrams." By A. T. Dover. London: Whitaker & Co. Price 6s. net.

"Continuous-Current Motors and Control Apparatus." By W. P. Maycock. London: Whittaker & Co. Price 6s. net.

"British Standardisation Rules for Electrical Machinery." Report No. 72 (1917) of the British Engineering Standards Committee, revised September, 1917. London: Crosby Lockwood and Son; or the Committee. Price 1s. net. (See our "Notes" columns to-day.)

Trade Statistics of Spain.—The figures given below show the imports of electrical and other similar goods into Spain during the year 1916 according to official statistics. The figures for 1915 have been added for the purposes of comparison, and increases are also shown. The detailed returns giving countries whence the goods were imported will probably not be available for some months:—

	1915. Pesetas.	1916. Pesetas.	Inc. or dec. Pesetas.
Arc lamps	14,000	16,000	+ 2,000
Carbons for arc lamps ...	33,000	6,000	- 27,000
Incandescent electric lamps, mounted ...	2,420,000	2,218,000	- 202,000
Ditto, unmounted ...	34,000	7,000	- 27,000
Dynamos, electric motors, induction coils, resistances, transformers, &c., up to 100 kg. weight	1,847,000	2,351,000	+ 504,000
Ditto, weighing from 101 to 400 kg. ...	937,000	1,731,000	+ 794,000
Switchboards and interrupters, up to 400 kg. weight ...	312,000	576,000	+ 264,000
Dynamos, electric motors, &c., and switchboards, weighing from 401 to 2,500 kg. ...	1,076,000	2,339,000	+ 1,263,000
Ditto, weighing from 2,501 to 5,000 kg. ...	560,000	392,000	- 168,000
Ditto, weighing more than 5,000 kg. ...	1,804,000	2,369,000	+ 565,000
Accumulators and electric batteries ...	98,000	150,000	+ 52,000
Cables and electric wire with or without insulating material, of 1 cm. diameter or more ...	155,000	123,000	- 32,000
Ditto, less than 1 cm. in diameter ...	127,000	121,000	- 6,000
Telegraph and telephone apparatus, electric meters and parts ...	2,444,000	4,688,000	+ 2,244,000
Electrodes ...	63,000	79,000	+ 16,000
Hydraulic motors ...	1,627,000	1,119,000	- 508,000
Steam and gas engines (stationary) up to 10,000 kg. weight ...	515,000	607,000	+ 62,000
Ditto, from 10,000 to 25,000 kg. weight ...	49,000	200,000	+ 151,000
Ditto, over 25,000 kg. weight ...	250,000	360,000	+ 110,000
Cylindrical boilers ...	156,000	141,000	- 15,000
Multitubular boilers ...	1,801,000	2,355,000	+ 554,000

Lamp Prices in Germany.—The German Association of Electric Lamp Manufacturers has recently issued a new price list, which shows an advance of 40 per cent. in the price of metal filament lamps and of 20 per cent. in those of carbon filament lamps.

Trade Inquiries.—H.M. Consul-General in Paris states that an agent there desires to get into touch with United Kingdom manufacturers of railway material, electrical appliances, &c., with a view to obtaining agencies for trade after the war. Inquiry No. 369, Department of Commercial Intelligence, 37, Basinghall Street, E.C. 2.

Catalogues and Lists.—THE B.E. CO. (of London and Birmingham), LTD., Mansion House Chambers, Queen Victoria Street, London, E.C. 4.—Two leaflets, one giving net prices for non-association V.I.R. cables, the other describing the "Beco" dimmer. Copies will be sent on application.

Patent Application.—THE MENNO LUBRICATOR CO., LTD., has applied for restoration of Patent No. 27,131, of 1905, granted to J. F. Lewis for "Improvements in Automatic Grease Cups."

Liquidations.—In the Chancery Division, last week an order was made for the winding up compulsorily of the GOLD-SCHMIDT, LTD., which has already been ordered to be wound up under the Trading with the Enemy Act.

UNITED CARBORUNDUM AND ELECTRITE WORKS, LTD. [Enemy Company].—The last date for creditors' claims to be sent in to the controller, Mr. C. Eves, 62, New Broad Street, E.C., is November 30th.

Lantern Slides.—MESSRS. ED. BENNIS & CO., LTD., inform us that they have a large number of lantern slides dealing with the development and present practice in connection with automatic stokers, coal elevators and conveyers, &c., which they will be pleased to loan to any responsible inquirer for lecture purposes. A set of slides on the subject of ash removal is in course of preparation, and will be ready shortly. A list of the slides and particulars of their subject matter can be obtained on request. Applications should be made as far as possible in advance of the lecture date to Messrs. Ed. Bennis & Co., Ltd., 28, Victoria Street London, S.W. 1.

Trade Announcements.—MR. A. E. BLOWER has resigned his position with the Wandsworth Electrical Manufacturing Co., Ltd., by mutual agreement, after many years' service with the company, and has commenced business on his own account, in company with Mr. A. Cooper, under the style of Blower & Cooper, electrical and engineering suppliers, having purchased the business carried on for some years by Messrs. Cooper & Roberts, at 3, Paul's Bakehouse Court, Godliman Street, E.C.

By permission of the Ministry of Munitions, and by order of the trustee, the stock-in-trade of MR. B. C. COUSINS, electrical and nautical contractor, Wyre Dock, Fleetwood, has been disposed of by auction.

Bankruptcy Proceedings.—R. E. CONNOLD, late electrician, now R.N.A.S., Canterbury.—Trustee released July 27th, 1917.

A. E. FELGATE, electrical engineer (late trading with W. Storey as Felgate & Storey). Reading.—November 22nd is fixed for hearing application for debtor's discharge.

Sterling Fire Brigade at Work.—On Friday last an outbreak of fire on property near the Sterling Works was promptly overcome by the swiftness of the fire brigade connected with the Dagenham works of the STERLING TELEPHONE AND ELECTRIC CO., LTD. The managing director, Mr. Guy Burney, superintended the efforts of the amateur firemen, assisted by Mr. A. Crawford, and others. Had it not been for the alertness of the brigade, in all probability a whole row of cottages would have been burnt to the ground; as it was the damage was confined to some stables and store-houses.

LIGHTING AND POWER NOTES.

Accrington.—PRICE INCREASE.—The Electricity and Tramways Committee has decided to advance the charge for current, in order to meet the greatly increased cost of production. Where the consumer is on the rateable value system, and also where current is used for heating purposes only, 10 per cent. is to be added to the consumer's account each quarter. A similar addition will be made to the charges in the case of power users not affected by the sliding rate regulated by the price of coal, whilst power users under agreement are to be charged at the increased rate of 0.6d. per unit, in addition to the increase owing to the advance in coal prices.

Argentina.—A strike of the stokers and engine-room staff employed at the South Dock power station of the German Trans-Atlantic Co. recently occurred, which also spread to the company's power station at Boca, and to the employés of the tramway running to South Dock. The company appealed to the municipal authorities, who secured the services of a naval force to operate the power plant and guard the station. The *Review of the River Plate* contrasts the prompt action of the authorities in the case of this German company with their attitude during the recent railway trouble, when, after considerable delay, the troops sent were unable to prevent considerable damage being done. Owing to the strike the Anglo-Argentine Tramways Co. had to reduce its services between 5 and 9 p.m.

Bedford.—The mains are to be extended to the works of the Cryselco Co., Rogers' Flour Mills, English Bros., and Hobson and Co., and an additional cable provided for the Queen's Engineering Works. The cost in the case of the Cryselco Co. will be £3,835, and the company is to be asked to pay £2,420 and guarantee at least £550 per annum for seven years.

Belturbet (Co. Cavan).—A dispute with regard to the electric lighting supply has been settled by the Council agreeing to pay the contractor's terms for the season, £70. Fears were entertained that the power plant might be removed if the dispute continued, and protests were made at a ratepayers' meeting.

Bradford.—PRICE REVISION.—Last week the Electricity Committee, after a lengthy discussion, reaffirmed its proposed revision of electricity charges (previously enumerated in the ELEC. REV.), which were referred back to the Committee by the City Council on October 9th; the proposed charges have been re-sub-

mitted for approval. The chief objection at the Council meeting was the proposed raising of the charge to the 4d. flat rate consumers; the Council decided to defer the matter for three months.

The Electricity Committee has authorised the Town Clerk to protest, on the Committee's behalf, that it is unfair that the increased price of coal for works is retrospective to September 17th, and to urge that the advance for works be brought into line with that for household purposes, and be retrospective, therefore, only to October 15th.

Permission has been obtained to proceed with the provision of a coal conveyor at Valley Road works.

Brighton.—The electrical engineer reports that he has been in negotiation with Messrs. D. Selby-Bigge, for the sale of two disused boilers at the North Road works, at £1,900. These boilers cost £2,150 in 1901. The Electricity Committee has decided to agree to the sale at the price mentioned.

Burnley.—PRICE INCREASE.—The Electricity Committee has decided to recommend the T.C. to increase the price of electricity by 12d. per unit for power and traction, and 1d. per unit for lighting.

Continental.—FRANCE.—A new company has lately been formed at Toulouse with a capital of £60,000 and the title *La Société l'Electro-Metal*, to acquire the rights to certain waterfalls near Griff, in the Upper Pyrenees, to establish a hydro-electric plant to utilise the same in the generation of electrical energy, and to establish works for the electrical production of ferro-silicon.

ITALY.—The impossibility of procuring coal at the present time has brought about the bankruptcy of the *Società Anonima Lucana di Industrie Elettriche*, at Salerno. The company was formed in 1913 with the object of generating and distributing electric energy at Valla Lucana. This company is to be distinguished from the *Società Lucana per Imprese Idroelettriche*, of Naples, which generates its current from water power obtained from an artificial lake or reservoir built and leased by the State, the only instance of its kind of the Italian Government helping the electrical industry. — *L'Elettrotecnica*.

Owing to the scarcity of labour, the *Società Mineraria ed Elettrica del Valdarno*, Florence, has found it impossible to finish the projected 7,000-volt transmission line which was to bring energy from the hydroelectric station at Terni. The company, however, contemplates carrying out other hydroelectric installations, on which some 6,000,000 lire are to be expended.

Croydon.—YEAR'S WORKING.—The report of the 20th year's working of the Corporation electricity undertaking shows a net increase in revenue of £2,586, but an increase of £2,739 in working expenses. The net loss on the year's working is £1,690. The units sold totalled 8,258,778, an increase of 290,544 over the previous year. Electricity to the value of £203 was supplied free to hospitals, convalescent homes, &c. Coal cost £3,616 more than the year before, and the heating value per ton (says the borough electrical engineer) has seriously deteriorated. The purchase of a 4-ton electric lorry has resulted in a saving in haulage charges equivalent to £250 a year. Of the 51 men of the department who have joined the Army four have been killed.

Edinburgh.—YEAR'S WORKING.—The annual accounts of the Corporation electricity undertaking show that 18 million units were sold, practically half being for power purposes. The total revenue was £142,611 and the gross surplus £59,250; after meeting the usual loan charges, taxes, &c., there remains a deficit of £4,726, which was provided out of reserve, the latter fund now having a balance in hand of £100,172.

Falkirk.—PRICE INCREASE.—The T.C., in view of the increase of 2s. 6d. per ton in the price of coal, has raised its charges for gas and electricity for the second time within a month. For electricity charges for lighting are increased by 1d. per unit, and for power purposes by 0.75d. per unit.

Gillingham (Kent).—The T.C. has rejected a recommendation by the Electricity Committee to further increase the charges for current by 10 per cent., in addition to the recent advance of 15 per cent.

Glasgow.—PRICE REVISION.—At a meeting of the Sub-Committee on Finance of the Electricity Committee, the engineer intimated that the Controller of Mines had authorised an increase in the price of coal by 2s. 6d. per ton at the pit mouth from 17th ult., and he reported that this would entail on the electricity department an additional expenditure on fuel for the current year of about £25,000, to meet which an increase in the charges for electrical energy would be necessary. The Sub-Committee agreed to recommend that the charges for motive power purposes be increased 7 per cent. as from and after the date of last survey. At a subsequent meeting of the Electricity Committee this decision was rescinded, and it was decided to recommend the T.C. that the charges for all purposes be increased by 0.75d. per unit as from and after the date of the last survey. R.T. mains are to be laid from the new electricity works at Dalmaruock to St. Andrew's Cross works.

Greater London.—ELECTRICITY SUPPLY.—Meetings have been held of the conference of local authorities owning electricity undertakings in Greater London. At the first meeting 24 authorities were represented by 42 delegates. It was resolved—“That the Electric Power Supply Committee be requested to hear evidence from the conference with respect to the supply of electrical energy in Greater London by local authorities.” It was

further resolved to appoint a Committee consisting of three municipal representatives, three town clerks, and three engineers, to prepare evidence, one of each to be elected from the Outer London authorities. On the invitation of the L.C.C. Special Committee, it was decided to appoint delegates to meet the L.C.C. Committee to discuss the situation created by the conclusions arrived at by the Board of Trade Committee. It was resolved that each local authority represented at the conference be asked to subscribe the sum of two guineas towards the expenses of the conference. At further meetings it was reported that the B. of T. Committee had agreed to hear one witness. It was resolved that the Committee be again asked to hear three witnesses—viz., one municipal representative, one town clerk, and one engineer, and the three witnesses suggested were appointed. It was stated that the L.C.C. Special Committee desired representatives of the Outer London authorities to be included in the delegation, and representatives from the following authorities were elected—viz., Croydon, Erith, Ilford, and Walthamstow.

Halifax.—At the T.C., last week, there was criticism on the bill of charges presented in the accounts of the Electricity Committee for the services of Sir John Snell, as adviser in connection with the purchase of the site at Copley with a view to expected power station developments in the future. The item was £112, which, it was contended, was excessive. Upon a vote being taken, an amendment referring the item back to the Committee was carried by 20 votes to 19.

Heywood.—PRICE REVISION.—In view of the increased cost of coal, &c., it has been decided to advance the charge for current for power purposes from January 1st next.

London.—L.C.C.—The Finance Committee recommends the Council's sanction to the borrowing of £1,500 by the Poplar B.C. for the provision of an electricity sub-station, and of £2,088 by the Woolwich B.C. for electricity mains.

Leeds.—ELECTRICITY EXTENSIONS.—We have received from Mr. Nelson Hefford, manager of the Corporation electricity undertaking, a report on the further extension of the Whitehall Road generating station. This report has been adopted by the Electricity Committee, and, subject to the approval of the City Council, the first portion of the extensions, embracing a 12,000-kw. turbo-alternator, boilers, auxiliary plant, buildings, &c., will be put in hand, at an estimated cost of £300,000; also the replacement of two 1,400-kw. reciprocating sets by a 6,000-kw. turbine set, at an estimated cost of £35,000. It may be recollected that in 1914 the Corporation adopted a report under which the older works on the Whitehall Road site were to be reconstructed, new engine, boiler, and switch houses, &c., being provided to accommodate 36,300 kw. of generating plant in three 12,000-kw. sets. The first portion, comprising about one-third of this scheme, estimated to cost £198,250, but actually having cost some £25,000 more, will be completed by the end of the year, and the present recommendations deal with the further stages of the work.

The older portion of the works contains at present 26,600 kw. of generating plant and 21,000 kw. of boilers, while the first section of the new works contains 18,000 kw. of generating plant (i.e., a 12,000-kw. set and a 6,000-kw. set installed as a safeguard against breakdown in the older plant) and 12,800 kw. of boiler plant. There will therefore be 44,600 kw. of electrical and 33,800 kw. of boiler plant installed at the end of the year.

On the basis of past experience it is estimated that the maximum demand will reach 28,000 kw. in 1918, and that the plant margin will be 1,800 kw. electrical, with a shortage of 1,500 kw. in boiler plant; in 1919, 31,500 kw. max. load, with margins of 1,500 kw. electrical, 50 kw. boilers; in 1920, 35,000 kw. max. load, with 5,500 kw. electrical and 3,150 kw. boiler margin; and in 1921, 38,500 kw. max. load, with 11,000 kw. margin electrical and 8,450 kw. margin of boiler plant. The total available plant at that date will be 52,500 kw. of electrical and 46,950 kw. of boiler plant. The electrical total includes, in addition to the two 12,000-kw. sets required to complete the 1914 scheme, two 6,000-kw. sets, which it is intended to install in place of the last remaining reciprocating sets (four of 1,400 kw. each).

The report contains some interesting calculations evidently based on the actual conditions existing in the present plant; thus Mr. Hefford estimates that the use of the more efficient 6,000-kw. set for 3,000 hours in place of older turbine plant would result in a saving of £178 per annum in coal, and again the use of the older turbine plant for 500 hours in place of the displaced reciprocating plant, would save another £900 in coal. In addition, the boilers on the new basis would supply 1,282 kw. more plant, equivalent to a saving of £21,110 on new boilers, &c., and £2,111 in annual charges.

It is proposed to utilise surplus profits and reserve in paying off the outstanding debt on reciprocating plant, &c., and allowing for the residual value of this plant and setting the financial charges on the new 6,000-kw. plant against that on the displaced plant, leaves a net increase in annual charges of £1,120, against which the savings (previously mentioned) of £3,519, would result in a net return of £2,399 per annum, or 8½ per cent. on the investment, during an estimated period of eight years. Mr. Hefford points out that this is approximately £1,000 per annum more than would be obtained by investing surplus money outside the business.

Manchester.—The Electricity Committee met specially to consider the reports of the Committee for the Interconnection of the Lancashire and Cheshire Electric Supply Systems, and a resolution was adopted without dissent approving of the principles contained in the reports, and without endorsing all the details at

this stage, authorising the chairman, deputy-chairman, and general manager, together with the town clerk, to attend further conferences on the subject.

Rochdale.—The Rochdale Tramways Committee has agreed to a recommendation of the general manager, Mr. George Webster, to close down the present electricity sub-station at Littleborough, and to substitute an additional cable from Smallbridge to Hurstead, at a cost of £450. It is expected that the new arrangement will result in a considerable saving to both the tramways and electricity departments, which will share the cost.

Salford.—PRICE INCREASE.—The E.C. recommends a further increase in the charges for electricity of from 10 per cent. to 20 per cent. for lighting, and from 15 per cent. to 30 per cent. for power, as from December 1st.

LINKING-UP.—The Electricity Committee agrees to the main outlines contained in the second report of the Committee for the Interconnection of the Lancashire and Cheshire Electricity Supply Systems, but considers the details thereof should be referred for consideration to a Committee consisting of representatives of each of the supply authorities concerned.

Southampton.—PRICE INCREASE, &c.—The T.C. has decided to increase the charges for electricity by 10 per cent. from the December readings, and to spend £6,300 out of capital account, £2,700 being for a new feeder for the Northam district and £3,590 for a new tramway feeder.

U.S.A.—ELECTRIC COOKING.—Data published by the N.E.L.A. shows that during 1916 the Boston Edison Co. sold 1,019 electric ranges, with an estimated rating of 5,225 kw.; more than 1,200 ranges were on circuit this year, or one range per 1,000 of population. A Western city had 1,194 electric ranges installed, or 46 per 1,000 of population; in San Francisco it is computed that there is one range per 1,000 of population, and in Ohio 1.3 ranges per 1,000 of population.

TRAMWAY AND RAILWAY NOTES.

Belfast.—The half-yearly return of the revenue of the tramways shows that, allowing for all fixed charges, there was a credit balance of £315, which, under the existing war circumstances, was considered satisfactory.

Continental.—SPAIN.—Application has lately been made for a concession for the construction and working of an electric tramway in the town of Burgos.

Croydon.—YEAR'S WORKING.—Presented on Monday, the annual report of the Corporation tramways shows total receipts amounting to £89,585, working expenses £69,713, and war allowances £5,823. After allowing for bank interest and income-tax on stock, there remained a gross balance of £16,297; as £17,930 was required for interest, sinking fund, and taxes, the deficit on the year (ended March 31st) was £1,631, which had been taken from the reserve and renewals fund.

During the year over 19 million passengers were carried, giving a traffic revenue of 10½d. per car-mile; the car-mileage was 2,027,135. The chairman of the Committee (Alderman Allen) fore-shadowed great expense after the war in relaying the track and in needed extensions. The 75 cars, he said, had been kept thoroughly in order; many had been entirely rebuilt during the war. To October 19th the traffic receipts showed an increase of £14,236 over the corresponding period of last year.

Dewsbury.—Great inconvenience to working people has been caused by the suspension, owing to shortage of drivers, of the morning car service between Dewsbury and Earlsheaton. The tramway company has assured the Corporation Tramways Committee that every effort is being made to secure additional drivers.

Dover.—B. OF T. REPORT.—Col. J. W. Pringle, reporting on the runaway tramway accident which occurred on August 19th, comes to the conclusion that the driver "lost his head" at the critical moment, the accident being caused by his failure to cut off power as he approached the compulsory stopping place on the summit of Crabble Hill, and his further failure to utilise properly the sand and brake equipment. In the inspector's opinion, the driver's own statement that he was unable to move the controller (small) handle into the emergency brake position, confirms the view that power was applied as the car ran down hill; the inspector found, after the accident, no difficulty in manipulating the controller-handle with the power-handle in the "off" position. Col. Pringle states that men discharged as unfit for military duties on account of nervous breakdown are unlikely to prove suitable, two months later, as drivers on difficult routes; he doubts whether Local or County Appeal Tribunals are aware of the difficulties of finding suitable men, or whether they realise the public risk incurred when insufficiently trained men are employed. He points out that the war has materially reduced safe working conditions on tramways, and recommends that such a route should not be worked unless by men who have had at least a year's experience to their credit; that drivers be familiarised with the rheostatic brake; and that either single-deck cars be used on the route, or no passengers permitted to travel on the upper deck.

The T.C. has decided to levy a 1s. 6d. rate to meet compensation claims arising out of the above accident, which resulted in the death of 11, and injury to 59 other people.

Glasgow.—**WAGES.**—Sheriff Fyfe has issued an interlocutor regarding the wages of certain classes of employes in the tramway department. Generally speaking, the award provides (a) for male employes now in the service of the department having their pre-war remuneration increased by 15s. per week (7s. increase of wages and 8s. of war advance), so far as this has not already been done; (b) for female employes receiving remuneration, so far as not already given, equivalent to the remuneration set forth in certain orders by the Minister of Munitions. The result is that male employes in the various grades will receive increases varying from 2s. up to 7s. per week; female employes will receive no advance, as they have already 8s. per week more in the tramway service than they would have in a munition factory; the arbiter is of opinion that it is reasonable that male workers should be brought within the principle of the awards of the Committee on Production; and the principle which should be applied to female workers is that expressed in the orders of the Minister of Munitions above referred to.

Leeds.—The lighting restriction on the tramways has been considerably modified recently, with the consent of the Home Office—much to the satisfaction both of passengers and conductors—but some members of the public have shown a tendency to go beyond the intentions of the authorities, and it has been necessary to issue a warning against the removal of any of the shades still remaining on the cars.

London.—The Highways Committee of the L.C.C. recommends that the requests of the men employed at the Greenwich generating station for the application to them of the awards of the Committee on Production relating to the engineering and foundry trades, of leading cable hands, and cable hands, for an increase in wages of 100 per cent. on pre-war rates, and of wiremen and wiremen's mates on the depot wiring staff for increased war wages, be referred to the Electrical Conciliation Board.

The increase in fares on the Metropolitan Electric Tramways came into force last week, the services affected being Enfield and Euston, North Finchley and Finchley Park, and Bruce Grove and Finsbury Park. One of the longest penny sections in London—Finsbury Park to Wood Green—disappears, the stage now ending at Turnpike Lane, Hornsey.

Manchester.—**TRAFFIC FIGURES.**—The total revenue on the Corporation tramways for the half-year ended September 30th was £513,624, compared with £506,558 in the corresponding period last year. The working expenses were £310,325, and with war service allowances and bonuses, &c., the total expenditure was brought up to £455,011. The total car-miles run were 9,381,230. Expenditure on renewals amounted to £13,000. The recent arbitration awards granting further bonuses will cost the department about £45,000 per annum, which makes the total payable as war bonuses and war service allowances nearly £200,000 per annum.

TELEGRAPH AND TELEPHONE NOTES.

Argentina.—Automatic telephones have been installed at Cordoba and Rosario, and have given excellent results. An installation is shortly to be set up at Buenos Ayres.

A German submarine telegraph cable scheme hung up by the war is that from Emden to Pernambuco. The scheme was being carried out by a German cable firm of Nordenheim, and two sections from Emden to Teneriffe and from Teneriffe to Monrovia in the Republic of Liberia, were completed in March, 1911; the third and last section—that to Pernambuco—remains uncompleted.

Australia.—The transference of the Eastern Extension Co.'s cables ending at La Perouse, N.S.W., and Wakapuka, N.Z., respectively to Sydney and Wellington was to have been completed by the end of August, establishing direct communication between Wellington and Sydney, and thus avoiding two repetitions of messages en route.

New Cables.—A concession has been granted to the Western Telegraph Co., whose headquarters are in London, for a cable connecting Rio de Janeiro with the Isle of Ascension and for another cable joining Belem-Para, in the north of Brazil, with Barbados. The construction of these cables will greatly facilitate telegraphic communication between South America and the rest of the world.

Storm Damage.—Considerable damage to property was done by the gale in the West Riding last week, and telephone and telegraph wires were reported to be down in over a hundred places around Leeds and Bradford, communication with distant parts, including London, being considerably interfered with.

Wireless Telegraphy on Board Ship.—The Defence of the Realm Regulation which made compulsory the installation of the wireless telegraph on certain British ships of 3,000 tons and upwards has been amended by the reduction of the tonnage to 1,600.

Wireless Telegraphy on Zeppelins.—According to the *Times*, a French officer, who has examined the Zeppelin that was brought down intact at Bourbonnes les Bains last month, states that

the fleet of which it formed a part came to grief partly owing to the breakdown of its wireless apparatus due to the extreme cold at the high altitudes attained. There was also a failure on the part of the wireless stations on land from which the Zeppelins got information as to their position by code messages. Owing to the number of airships which lost their bearings, the land stations got confused, and their answers to questions asked of them were unintelligible.

It is known that, before the war, the Germans established a series of wireless stations near their frontiers for the purpose of guiding aircraft, but whether this system would be of any practical use in the case of airships moving at a considerable distance outside the ring seems to us very questionable, unless some form of directive receiving apparatus such as the Bellini-Tosi, or some system elaborated since the outbreak of war, has been installed on each airship.

CONTRACTS OPEN AND CLOSED.

OPEN.

Aberdeen.—November 19th. G.N. of Scotland Railway. Telegraph material for six or twelve months. Stores Superintendent, 80, Guild Street.

Australia.—**PERTH.**—December 5th. Deputy P.M.G. Telegraph and telephone instruments and parts, also battery material, according to schedule and conditions, a copy of which may be seen at the offices of the ELECTRICAL REVIEW, or at the Commonwealth Offices, Australia House, W.C.

December 12th. Deputy Postmaster-General. Switchboards, telephone parts, as per schedule, a copy of which, as well as the contract conditions, may be seen at the offices of the ELECTRICAL REVIEW, or at the Commonwealth Offices, Australia House, W.C.

Beckenham.—November 12th. U.D.C. Three months' supply of coal for the electricity works. See "Official Notices" to-day.

Enniskillen.—December 1st. Sligo, Leitrim & Northern Counties Railway Co. Telegraph material for 12 months. Mr. J. Duff, Secretary, Enniskillen.

South Africa.—November 12th. S. African Railways. 4,466 train-lighting cells. Secretary, Tender Board, S.A. Railway Headquarters, Johannesburg. Specifications may be seen at the Department of Commercial Intelligence, 73, Basinghall Street, London, E.C. 2.

Spain.—The municipal authorities of Soria have lately invited tenders for the concession for the electric lighting of the town during a period of six years.

Walsall.—November 5th. Corporation Tramways Dept. Twelve months' tramway stores. Tramways Manager, St. Paul's Buildings, The Bridge.
